BLENOSAN
CAPSULES

As a routine
treatment for

GENITO-URINARY CONDITIONS.

BLENOSAN is a mixture of the finest East India Santal Oil with a specially prepared fluid extract of Kava-Kava. It is presented in the form of accurately-measured Capsules, and affords an ideal medicament for the treatment of all inflammatory conditions of the urethra.

BLENOSAN is an improvement upon the ordinary Santal, and the full proportion of the alpha resin of Kava-Kava ensures all the anæsthetic and diuretic properties of the root in a standardised and dependable form.

BLENOSAN CAPSULES consequently are indicated in all pathological conditions which affect the genito-urinary system, including acute Cystitis, Vaginitis, and Leucorrhœa, and where intense hyperæmia and swelling of the mucous membrane give rise to a diminution of the urinary canal.

BLENOSAN CAPSULES are well adapted for the continuous and systematic treatment of such cases, and are being used with excellent results by many of the most experienced and successful Physicians.

BLENOSAN CAPSULES can be prescribed for a course of treatment extending over two or three weeks.

RELIABLE LIGATURES.

In ligature and suture material, there can be nothing better conceived for the sterile and aseptic preparation and conveyance of the same, than a hermetically sealed glass tube. Catgut or silk, as it is prepared in our laboratories must reach the surgeons' hands in absolutely sterile condition.
This is our positive guarantee.

BREAKABLE TUBES.

These Tubes possess advantages known to no other tubes. The perfection of Johnson & Johnson's Laboratory preparation of Ligature and suture material cannot be obtained elsewhere.

Glamorgan County Council.—

MEDICAL INSPECTION OF CHILDREN IN PUBLIC ELEMENTARY SCHOOLS.—The Glamorgan County Council invites applications for the appointment of a Temporary (Woman) MEDICAL OFFICER for the purposes of the Council's duties as Local Education Authority in the Inspection of Children in, and Medical Supervision of, the Public Elementary Schools, in pursuance of the Education (Administrative Provisions) Act, 1907.

The salary will be at the rate of £300 per annum, with travelling expenses.

The person appointed will be required to give her whole time to the duties under the control and supervision of the School Medical Officer, and to reside where directed by the Committee.

Preference will be given to candidates who have (a) had an adequate training in State Medicine or hold a Diploma in Public Health, (b) had some definite experience of school hygiene, (c) enjoyed special opportunities for the study of disease in children, and (d) who are able to undertake refraction work.

A knowledge of Welsh is desirable.

Applications for the appointment, stating age and qualifications, and accompanied by copies of not more than three recent testimonials, should be addressed to the School Medical Officer, Dr. D. J. MORGAN, County Hall, Cardiff, and should be received by him not later than the first post on the morning of the 5th November.

Canvassing, personal or otherwise, will be a disqualification.

T. MANSEL FRANKLEN, Clerk of the County Council.

Glamorgan County Hall, Cardiff, 25th October, 1917.

Birkenhead and Wirral Children's HOSPITAL, Woodchurch-road, Birkenhead.—There is a vacancy for a HOUSE SURGEON (Male or Female), duly qualified and registered, at the above Hospital. Honorarium by arrangement. Applications, with testimonials (copies), to be sent to F. W. ARCHER, 14, Cook-street, Liverpool.

Worcestershire Asylum, Barnsley Hall, Bromsgrove.—Wanted, for the duration of the war, a Temporary ASSISTANT MEDICAL OFFICER in order to release a medical man for Military Service. Applicants must be registered Medical Practitioners. Forms of application may be obtained from the Medical Superintendent.

Kensington and Fulham General HOSPITAL, Earl's Court, S.W.5. — Qualified RESIDENT MEDICAL OFFICER required for above Institution. Good opportunity for a man preparing for further qualification. Would suit discharged Service man. Salary £250 a year. Applications, with copies of testimonials, to be sent to the Secretary at the Hospital.

Chester Royal Infirmary (240 beds, 140 Military). — ASSISTANT HOUSE SURGEON wanted. Must be doubly qualified and registered. Salary £150 per annum, with board, apartments, and washing. Applications will be considered from fifth-year students at a lower salary.

Applications, stating age, with copies of testimonials, to be sent to the Hon. Secretary.

East London Hospital for Children, Shadwell, E. 1.—Applications are invited for the post of RESIDENT MEDICAL OFFICER. Applicants must be duly qualified Practitioners in Medicine and Surgery. Salary £150 per annum, with board, residence, and laundry. Applications, with testimonials, must reach the undersigned not later than Saturday, 10th November, 1917.

W. M. WILCOX, Secretary.

Bolton Infirmary and Dispensary (166 beds, mostly Surgical, including Wounded Soldiers).—Applications for the appointment of a SENIOR HOUSE SURGEON are invited from Ladies having a registered Medical and Surgical qualification. Salary £300 per annum, with apartments, board, and attendance.

Applications, stating age, with copy of testimonials, should be forwarded to the undersigned, from whom further particulars may be obtained.

A. E. BRISCOE, Secretary.

Great Northern Central Hospital, Holloway, London, N.7.—Applications are invited for Two HOUSE SURGEONS. Male candidates must be ineligible for Military Service. The appointments are for six months from the 1st December and 1st January respectively. Salary at the rate of £100 per annum, with board, residence, and laundry.

Applications, accompanied by copies of testimonials, should be sent to the undersigned as soon as possible, from whom forms of application and further particulars may be obtained.

29th October, 1917. GILBERT G. PANTER, Secretary.

Evelina Hospital for Children, South-wark, London, S.E.—The Committee of Management require a HOUSE PHYSICIAN and a HOUSE SURGEON for four months from 12th November.

Salary at rate of £160 per annum, with board, residence, and washing. Candidates (either sex) should send applications before 8th November, with three testimonials (copies only), to the Secretary at the Hospital.

Applicants (qualified and registered) must be interviewed by the Medical Committee. Selected candidates have to appear before the Committee of Management. Time and place of meeting will be notified by the undersigned, from whom rules and other particulars relating to the post *must* be obtained.

By order of the Committee of Management.

30th October, 1917. H. C. STANILAND SMITH, Secretary.

Hackney Union Infirmary.—Junior ASSISTANT MEDICAL OFFICER.—The Guardians invite applications from doubly qualified registered Medical Practitioners (either sex) for appointment of Junior Assistant Medical Officer at the above Infirmary, 230, High-street, Homerton, E. 9.

The Infirmary, which contains about 900 beds, is divided into Medical, Surgical, and Maternity Wards, and facilities are provided for Pathological and Bacteriological work. Besides the Medical Superintendent there are Four Resident Assistants and Two Dispensers.

The salary, which is £250 per annum, is inclusive, and rations and furnished apartments with attendance are provided.

The officer appointed will be required to render assistance at the other Establishments and Departments within the Union, to assist in the training and instruction of the Nurses, and to devote his or her whole time to the service of the Guardians.

The officer appointed must also be prepared to conform to the rules, orders, and regulations of the Local Government Board and the Guardians.

The appointment will be determinable at any time upon one month's notice, and will be subject to reconsideration on the termination of the war, to the approval of the Local Government Board, and to the provisions of the Poor Law Officers' Superannuation Act, 1896.

Canvassing the Guardians, either personally or otherwise, is strictly prohibited, and will disqualify a candidate. Applications, upon forms to be obtained from the Medical Superintendent, Hackney Union Infirmary, 230, High-street, Homerton, E. 9, must be delivered to him at once.

By order.

FRANK R. COLES, Clerk to the Guardians.

Clerk's Office, Hackney Union, Homerton, E. 9.

Royal Albert Edward Infirmary, Wigan.—The Board of Management of the above Infirmary invite applications for the whole-time position of SECRETARY, at a salary of £250 per annum.

Particulars of duties may be obtained from the Chairman of the Board. Applications, stating age and qualifications (accompanied by not more than three recent testimonials), must be sent to the Chairman on or before the 13th November, 1917. Canvassing is prohibited.

London Lock Hospital and Rescue HOME.—WARD SISTER required. Fully trained. Salary commencing at £40, with indoor uniform. Preference will be given to a Christian woman. Applications, with full particulars, to the Secretary, 283, Harrow-road, W.9.

Hertfordshire County Council.— TUBERCULOSIS HOSPITAL. — MATRON.—The Hertfordshire County Council invite applications for the post of Matron of the County Tuberculosis Hospital at Ware, Herts.

Candidates must possess a three years' certificate and have had experience in Hospital management. Experience in the management of Tuberculosis cases is also desirable.

Salary £60 per annum, rising by annual increments of £5 to £80 per annum, together with an allowance of £5 per annum for uniform.

Board and lodging will be provided free.

Applications, stating age, experience, qualifications, &c., accompanied by copies of three recent testimonials, to be sent to the undersigned not later than Wednesday, 14th November, 1917.

CHARLES E. LONGMORE,
Clerk of the Hertfordshire County Council.

Clerk of the Peace Office, Hertford, Herts, 29th October, 1917.

Boots Pure Drug Company Limited.

Keeping abreast with Medical Research

THE influence which medical research has on medical practice is more directly effective when accompanied by the immediate manufacture in marketable quantities of new compounds which are discovered. Of interest to the profession, no doubt, is the fact that **Boots** Pure Drug Co. Limited, are manufacturing synthetic and natural organic drugs of unsurpassed purity and excellence. They can supply immediately to the medical profession all the new antiseptics used by Dakin and his colleagues in their researches, which are described in various issues of the *B.M.J.* The attention of medical men is directed to

Oil solution of

Dichloramine-T

(toluene-p-sulphodichloramine)

FOR USE IN SURGERY AND NASAL ANTISEPSIS.

A complete outfit, containing the necessary drug, prepared oils, and atomiser, suitable for the treatment described and recommended by Dunham & Dakin in the *B.M.J.* of June 30th, 1917, page 865, for the disinfection of the naso-pharynges of carriers, is supplied by Boots Pure Drug Co. Limited. Supplies of Dichloramine-T are also available for prescription service on application through any of the 580 branches of Boots *The* Chemists.

Price of complete Outfit, **7/6** post free; or without Atomiser, **5/-**

THE

MEDICAL ANNUAL, 1917

BY TWENTY-SEVEN DISTINGUISHED CONTRIBUTORS.

This year's Volume has a unique value, for while the civil side of the Practitioner's work has received every attention as before, it also provides a careful review of the latest achievements in War Surgery and Medicine which cannot be obtained from any other single source. This will be of value to every Practitioner in dealing with such cases, with which he will inevitably be confronted now and in the years to come.

Thus the new "Annual" continues to be a digest of the best modern teaching, culled by experts from the medical literature of the world.

New (2nd) Edition

FAUGHT'S BLOOD PRESSURE

Just Issued

This is a *clinical* manual—written for the busy *man in general practice.* It contains the pith of medical literature on blood-pressure studies, not only in cardiovascular and renal conditions, but *in every disease* in which the sphygmomanometer has proved a diagnostic aid. The value of blood-pressure findings in determining physical fitness is indicated. There are chapters on hypotension, hypertension, arteriosclerosis, renal diseases, cardiac disease, pneumonia, typhoid fever, diphtheria, scarlet fever, cerebrospinal meningitis, tuberculosis, metabolic disorders, surgery, ophthalmology, obstetric practice, life insurance, &c. Blood-pressure findings frequently have a great bearing on the plan of *treatment* to be instituted.

"We have perused this volume with much interest; it contains a great deal of interesting information which will be found of value in actual clinical work."—THE LANCET.

Octavo of 478 pages, illustrated. By FRANCIS A. FAUGHT, M.D., formerly Instructor in Medicine at the Medico-Chirurgical College of Philadelphia. Cloth, 15s. net.

Galbraith's Four Epochs of Woman's Life

New (3rd) Edition

"Dr. Anna M. Galbraith has written on the subject of sexual hygiene for women with a considerable amount of good sense and reticence. It is probable that the reading of this book would be of real service to many women."—BRITISH MEDICAL JOURNAL.

12mo of 296 pages. By ANNA M. GALBRAITH, M.D. Cloth, 6s. 6d. net.

Sahli's Diagnostic Methods

2nd Edition

"The book is far more than a guide to diagnostic methods fully as it treats of these, for the author discusses thoroughly and exhaustively the interpretation of clinical phenomena both in their physiological and pathological aspects."—EDINBURGH MEDICAL JOURNAL.

Octavo of 1225 pages, illustrated. By Prof. Dr. H. SAHLI, of Bern, Switzerland. Edited, with additions, by NATHANIEL BOWDITCH POTTER, M.D., Assistant Professor of Clinical Medicine at Columbia University. Cloth, 27s. 6d. net.

Smith's What to Eat and Why

"We can recommend it as a very reliable guide to the dietetic treatment of disease. Its teaching is sound and may be relied upon to give satisfaction if carried out into practice."—MEDICAL PRESS AND CIRCULAR.

Octavo of 310 pages. By G. CARROLL SMITH, M.D., of Boston. Cloth, 12s. 6d. net.

Allen's Local Anæsthesia

"Every surgeon who wishes to place at the disposal of his patients the full advantages to be gained from recent advances in our knowledge should gladly study the records and results of Dr. Allen's work."

—DUBLIN JOURNAL OF MEDICAL SCIENCE.

By CARROLL W. ALLEN, M.D., Instructor in Clinical Surgery at Tulane University of Louisiana. With an Introduction by RUDOLPH MATAS, M.D. Octavo of 608 pages, 255 illustrations. Cloth, 25s. net.

Books sent, Carriage Paid, on Receipt of Price.

W. B. SAUNDERS COMPANY, 9, Henrietta St., LONDON, W.C. 2.

Not to be thrown away

For a few pence BATES will fit new fingers or wrists, mend slits or tears so neatly that joins cannot be felt by the surgeon.

BATES have the Sole Rights for the U.K. to make these

Repairs by New Process.

Repeated Sterilisation does not affect the mends. Damaged gloves are made as good as new at a trifling cost.

Used regularly by a large number of General and Naval and Military Hospitals.

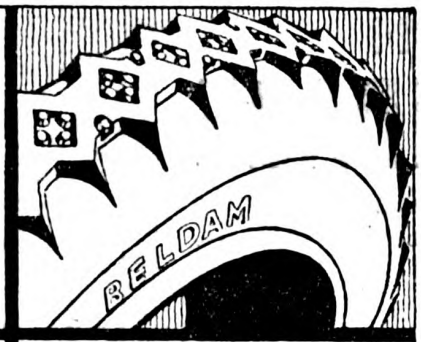
Use a Douglas Motorcycle

THE Doctor with a country practice will find the DOUGLAS an invaluable war-time investment, for the DOUGLAS is always ready to take the road for a no-trouble journey anywhere at any time.

If your practice is scattered—if some of your patients live in remote country villages or distant suburbs—you will appreciate DOUGLAS service all the more on that account. The DOUGLAS will enable you to double your professional usefulness at this critical time.



Recognising this fact the Ministry of Munitions is granting to Doctors permits for the purchase of DOUGLAS motorcycles.

May we send YOU full particulars?

THE NORWICH CRÊPE ✚ BANDAGE

SUPERIOR ENGLISH MANUFACTURE
Extremely Elastic, but contains no rubber.
FAST WOVEN EDGES.

"I'm ready for the day's work when I've got my Norwich Crêpe Bandage on."

Suitable for all Climates.

Standard Qualities made of

ALL WOOL

WOOL and SILK

WOOL, SILK & COTTON

WOOL and COTTON

ALL COTTON

THE BANDAGE THAT CAN BE STERILIZED.

IMPORTANT
THE EDGES WILL NOT FRAY OUT NOR RAVEL.

Invaluable for all binding purposes. Entirely displaces bandages of rubber and elastic web. Considerably more durable, although less than one-third the price. Can be sterilized and washed repeatedly or laid aside for long periods without deterioration. Allows free circulation and ventilation and necessary warmth.

WOOL v. COTTON
Sterilized Bandages.

Patients having varicose veins and other ailments requiring the use of bandages usually suffer from cold extremities, due to bad circulation. They require *warmth* as well as support. The Norwich Crêpe Bandages, containing wool provide this warmth and do not absorb grease so readily as those made of cotton. Moreover, they may be thoroughly cleansed by the use of *hot* (not boiling) soapy water, with the addition of a little ammonia or soda. The bandages are healthy and comfortable to wear, giving the necessary firmness, yet yielding to every movement. Self clinging and self-adjusting, no folding is required and their gentle touch is, in itself, a relief to the patient. They can be stretched to any needed length without contracting width; consequently, they can never get "stringy."

The Norwich Crêpe Bandage is made and supplied to the leading wholesale houses, neatly wrapped in labelled packages. Its inexpensiveness, compared with foreign productions, and its high quality, universally commended by the medical and nursing professions, make it ideal for sufferers from varicose veins and for all purposes where bandages are required. Send for prices and samples to the sole manufacturers:

1867 HAYDEN'S HVC VIBURNUM COMPOUND 1917

In 1867 HAYDEN'S VIRBURNUM COMPOUND was first introduced, and for fifty years it has enjoyed an ever-increasing demand, due to the confidence accorded it by the medical profession for its therapeutic dependability in Gynecological and Obstetrical conditions.

It gains and retains confidence by the results it manifests therapeutically, the only convincing test of the value of a medicinal remedy and upon this basis we invite your consideration.

Accord Hayden's Viburnum Compound a trial in your next Dysmenorrheal patient, and *you will be convinced*. *Dose*: One or two teaspoonfuls three times a day or as required. Administer in three or six teaspoonfuls of hot water.

A supply of the genuine H. V. C., with literature, will be sent you on request.

Sole Agents for Gt. Britain: THOS. CHRISTY & CO., 4-12, OLD SWAN LANE, LONDON, E.C.4.

Prescribed by the Medical Profession for 35 years.

The BRITISH MEDICAL JOURNAL says: "Time and use have justified the claims put forward for Benger's preparations."

Milk is indigestible by many people.——

This is well-known by physicians to be a deprivation, and frequent cause of pain and discomfort to weakly or debilitated persons.

Wherever there is inability to digest milk, and whenever milk diet is advisable, Benger's Food may be prescribed with confidence. It changes (or softens) the casein of the milk so that it separates in presence of the acid gastric juice into minute flocculæ, instead of heavy curd.

The ease with which these smaller particles are digested and assimilated enables the patient to obtain more readily the whole of the Food-value in the milk.

BENGER'S FOOD

itself is also rich in food elements necessary to sustain life, and in a most easily digested form.

It agrees with the most sensitive stomachs, from infancy to extreme old age.

A physician's sample, with all particulars, will be sent post free upon application to any member of the Medical Profession.

BENGER'S Food

for INFANTS, INVALIDS, AND AGED PERSONS,

is quite distinct from every other food obtainable, and is sold throughout the World by Chemists, &c., in sealed tins.

Boots Pure Drug Company Limited.

Keeping abreast with Medical Research

THE influence which medical research has on medical practice is more directly effective when accompanied by the immediate manufacture in marketable quantities of new compounds which are discovered. Of interest to the profession, no doubt, is the fact that Boots Pure Drug Co. Limited, are manufacturing synthetic and natural organic drugs of unsurpassed purity and excellence. They can supply immediately to the medical profession all the new antiseptics used by Dakin and his colleagues in their researches, which are described in various issues of the *B.M.J.* The attention of medical men is directed to

Oil solution of

Dichloramine-T

(toluene-p-sulphodichloramine)

FOR USE IN SURGERY AND NASAL ANTISEPSIS.

A complete outfit, containing the necessary drug, prepared oils, and atomiser, suitable for the treatment described and recommended by Dunham & Dakin in the *B.M.J.* of June 30th, 1917, page 865, for the disinfection of the naso-pharynges of carriers, is supplied by Boots Pure Drug Co. Limited. Supplies of Dichloramine-T are also available for prescription service on application through any of the 580 branches of Boots *The* Chemists.

Price of complete Outfit, 7/6 post free; or without Atomiser, 5/-

GOLD MEDAL, LONDON, 1908
Grand Prix, Nancy and Quito, 1909
Hors Concours, San Francisco Exhibition, 1915

COMMUNICATIONS:
Academy of Medicine, Paris, 10th Nov., 1908.
Academy of Sciences, Paris, 14th Dec., 1908.

URIC ACID is never found free in the organism. It always exists in a state of combination with Soda, Ammonia, &c.; it forms biurates or quadriurates, which are complex and not easily soluble.

URODONAL by reason of its special composition, is able to effect the double chemical decompositions which liberate the Uric Acid from the combinations where it is fixed, and cause it to be easily eliminated in the urine.

URODONAL is a most powerful solvent of **URIC ACID,** because it can destroy its organic combinations.

URODONAL.—Price 5/- and 12/- per bottle.
Prepared exclusively at CHATELAIN'S Laboratories, 2 & 2 bis, rue de Valenciennes, Paris.
Can be obtained from all Chemists and Stores, or direct from the Sole British and Colonial Agents—

Hypothyroidism and Hyperthyroidism

WHEN employing thyroid medication in conditions depending upon partial or complete inactivity of the gland, careful selection of the preparation to be administered is essential for success. Commercial samples of Thyroideum Siccum vary widely in their medicinal value. *(See* BRIT. MED. JOURN., *October 27, 1917, p. 570.)*

The following STANDARDISED PREPARATIONS are offered to the Medical Profession as reliable therapeutic agents.

DESICCATED THYROID GLANDS
(P., D. & Co.)

Prepared from carefully selected, fresh healthy glands. Free from ptomaines. Assayed and guaranteed to contain not less than 0·2 per cent. of iodine.

Supplied in bottles of 1 ounce.

THYROID TABLETS (P., D. & Co.)

Prepared from the above-mentioned assayed product, and supplied in the following range of doses:—

In terms of fresh gland	In terms of dried gland	In terms of fresh gland	In terms of dried gland
½ grain equiv. to	about 1/10 grain	2½ grs. equiv. to	about 1/2 grain
1 grain ,,	,, 1/5 grain	3 grains ,,	,, 3/5 grain
1½ grains ,,	,, 1/3 grain	5 grains* ,,	,, 1 grain
2 grains ,,	,, 2/5 grain	10 grains* ,,	,, 2 grains

* These tablets can be supplied either plain or chocolate-coated.

Supplied in bottles of 100, 500, or 1000 tablets.

THYROPROTEIN

Thyroprotein is a concentrated extract, consisting of the pure proteid of healthy thyroid gland without its inert substance. It is standardised to a definite iodine content. It provides the most reliable and exact means of applying thyroid administration.

In conditions dependent upon comparatively slight degrees of thyroid insufficiency, oral doses of 1/50 grain of this concentrated product are ample; in cases exhibiting marked hypothyroidism (e.g., myxœdema, cretinism, etc.) the dose may be run up quickly to 1/10 grain. The hypodermic dose is from 1/50 to 1/25 grain.

Thyroprotein is supplied as follows:—

Thyroprotein Tablets containing either 1/50, 1/25, or 1/10 grain in each. Bottles of 50 tablets.

Thyroprotein Solution *(for hypodermic administration)* containing 1/50 grain of Thyroprotein in each c.c. Boxes of 6 or 12 ampoules of 1 c.c.

* * * * * *

IN the treatment of exophthalmic goitre, or any condition dependent upon excessive thyroid activity, beneficial effects have often been obtained by the administration of the serum or the inspissated blood of animals which have been deprived of the thyroid gland. It is assumed that such blood will be specially rich in those principles which in normal animals combine with and prevent an excess of thyroid secretion. The following preparations are offered:—

THYROIDECTOMISED HORSE SERUM (P., D. & Co.)

From the blood of healthy horses which have been deprived of the thyroid gland. Oral dose, 1 to 5 c.c., diluted with water or wine. Hypodermic dose, 0·5 to 1 c.c.

Supplied in vials of 30 c.c.

THYROIDECTIN (P., D. & Co.)

A powder prepared from the blood of thyroidectomised animals. Non-toxic. Supplied in capsules containing 5 grains. Dose: 1 or 2 capsules thrice daily. Prolonged administration is often necessary before the effect can be judged.

Supplied in bottles of 50 or 100 capsules.

PARKE, DAVIS & CO., 50-54, BEAK ST., REGENT STREET, **LONDON, W.1.**

Telegraphic Address: "CASCARA, LONDON." Telephone No.: REGENT 3260 (six lines).

SQUIRE'S TERPEROIN & CINNAMAL PREPARATIONS.

TERPEROIN (RECD.) ELIXIR

(SQUIRE).

DOSE—One to two fluid drachms = 3·6 to 7·1 c.c.

SQUIRE'S TERPEROIN ELIXIR affords immediate and welcome relief in the troublesome cough of PULMONARY PHTHISIS. It is prescribed with striking success in ASTHMA, Emphysema, Acute and Chronic BRONCHITIS, Laryngeal Catarrh, PERTUSSIS, and in other disorders of the respiratory system.

PAST. TERPEROIN COMP.

(SQUIRE).

DOSE—One or two occasionally.

COMPOUND TERPEROIN PASTILLES are exceptionally convenient, as they can be carried in the vest pocket during the daytime, and thus a dose of the medicament is always handy. A distressing cough is immediately relieved by their use.

"Both ELIXIR TERPEROIN and PAST. TERPEROIN CO. (SQUIRE) have been found extremely useful in the diseases incidental to WAR."—THE PRACTITIONER.

CINNAMAL (RECD.)

DOSE—10 to 30 minims = 0·6 to 1·8 c.c.

SQUIRE'S CINNAMAL is an antiseptic fluid which affords a valuable protection against INFLUENZA.

CINNAMAL WITH QUININE

DOSE—10 to 30 minims = 0·6 to 1·8 c.c.

SQUIRE'S CINNAMAL WITH QUININE combines the antiseptic and prophylactic properties of CINNAMAL with the antipyretic and antiseptic properties of the QUININE. It is particularly valuable as a precaution against INFLUENZA, and is also useful in CORYZA and CATARRH.

CINNAMINT (RECD.) TABLETS

DOSE—One or two tablets as required.

CINNAMINT TABS. are a more portable and convenient form of CINNAMAL, and are particularly serviceable as a protection against INFLUENZA. The antiseptic value of the CINNAMAL is supplemented by the powerful antiseptic action of a Formaldehyde derivative.

Descriptive leaflets gratis on application.

Byno Cascada

(Trade Marks)

The Ideal Tonic Laxative and Nutrient Digestive.

"BYNO CASCADA" presents the stimulating tonic laxative principles of the finest Cascara Sagrada and Rhamnus Frangula incorporated in "Bynin" pure active liquid malt.

The gentle, yet persistent, tonic effect of Cascara on the intestinal muscle, reinforced by the influence of "Bynin," in promoting the digestion and assimilation of food, renders "Byno Cascada" the ideal prescription to ensure normal bowel activity.

Equally valuable in childhood, in pregnancy, for nursing mothers, and in old age, "Byno Cascada" is preferred in scientific treatment.

Issued in Bottles at

3/- and 5 6.

Allen & Hanburys Ltd.,

LOMBARD STREET, LONDON.

Niagara Falls, N.Y. Toronto Buenos Aires. Durban Sydney.

The Dietetic Treatment of Disease.

The 'Allenburys' DIET

Invaluable in Sickness and Convalescence.

MEDICAL TESTIMONY

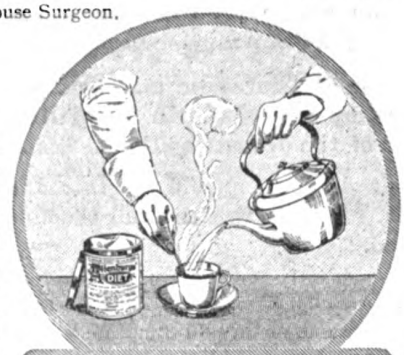
The following unsolicited testimonials illustrate the value of the 'Allenburys' Diet.

Obstinate Vomiting

"I used your Diet with **complete success in a case of most intractable vomiting, it being the first and only substance which the patient retained;** but after its use for a few days she was able to ascend the dietary scale in a steady rise.

. . . . . House Surgeon.

Dyspepsia and Old Age



"Please send me by return (as the case I require it for is a very urgent one) six tins of Diet. I have found it **most beneficial in a case of an aged dyspeptic,** and I shall have much pleasure in recommending it wherever possible.

. . . . . M.D.

An Intractable Gastric Case

"I may say that I tried, with very great success, your Diet on an intractable gastric and intestinal case. **I verily believe it was the means of saving the man's life,** for he could digest nothing until I gave him **your Diet, which speedily brought him round, and enabled him to tide over a very critical period of his ailment.** I certainly consider the nutritious qualities of your Diet to be of a high order."

. . . . . M.B.

A Valuable Evening Meal

"I used it with a patient I had under close observation, **the result was marvellous.** She has now had three large tins, and **has not been so well for some years.** I gave it only at night, an hour before bedtime, and **though only taken once in twenty-four hours she has gained over six pounds in weight,** while previously she was losing daily. It certainly is **a most satisfactory preparation."**

L.R.C.P., L.R.C.S.

Excellent for the Gouty

"I am using it myself and find it a good food. I think it is an **excellent supper dish for a gouty man, and I sleep well** after taking it."

. . . . . M.D.

Promotes Refreshing Sleep

"I have used the "Allenburys" Diet at night with considerable benefit. I find it **sustaining and comforting,** and **sleep much better** after taking it."

. . . . . M.D. (Lond.)

Quite *distinct* from the "Allenburys" Foods for Infants.

The "Allenburys" DIET is made from pure, rich full-cream milk and whole wheat, both ingredients being partially pancreatised during the process of manufacture. The "Allenburys" DIET is a complete food chiefly intended for Adults, and is an essential nutrient for **Invalids, Dyspeptics and the Aged.** It is quickly prepared, exceptionally palatable, easily digested, and wholly nourishing.

Prices: In tins at 1/9 and 3/6 each. A large sample sent free on request.

ALLEN & HANBURYS LTD., Lombard Street, LONDON.

COLLOSOL ARGENTUM

CROOKES'

COLLOSOLS are Drugs in the COLLOID STATE.

COLLOSOLS are isotonic and isomorphic with the elements of the body.

A PROTECTED SALINE COLLOIDAL SOLUTION OF SILVER.

Powerfully catalytic and germicidal. The colloidal condition is not readily destroyed by the tissues, body fluids and organic matter, and the significance of this is important, in that loss of "Brownian" movement connotes loss of catalytic and bactericidal power.

Internally, COLLOSOL ARGENTUM as a non-toxic intestinal antiseptic, in clinical practice, has been found of great service in **Urticaria** and other conditions suggestive of **Toxæmia,** as an aid in the treatment of **Bacilluria** and **Cystitis,** and in **Diarrhœa** and bacillary **Dysentery.**

Externally, may be applied diluted or undiluted. In the case of lesions and wounds promotes natural healing processes. In **Tonsillitis** and Throat Affections, stimulates a healthy condition of the delicate epithelial tissues.

In **Cystitis,** one to four drachms should be introduced into the bladder at night, and allowed to remain. In this way the full benefit of the catalytic action of the colloidal silver is obtained.

COLLOSOL ARGENTUM PESSARIES. — Gradually dissolve and give prolonged suffusion of the walls of the vagina. Of great value in the treatment of **Leucorrhœa** and similar affections.

COLLOSOL ARGENTUM SUPPOSITORIES.—For treatment of **Hæmorrhoids, Pruritus Ani,** &c.

COLLOSOL ARGENTUM OINTMENT in lanoline base, as a powerfully antiseptic cream and catheter lubricant.

PASTA COLLOSOL ARGENTUM in glyco-gelatin base for convenience in treatment of **Skin Affections.**

COLLOSOL ARGENTUM BOUGIES for **Chronic Gonorrhœa.**

COLLOSOLS are prepared for the Proprietors, Crookes' Collosols Ltd., at

THE CROOKES' LABORATORIES,

50, Elgin Crescent, LONDON, W. 11.

"MALTINE"

"Maltine" presents the proteids, carbohydrates, and organic phosphates of malt in an agreeable, convenient, and readily assimilable form. It is standardised in diastase, concentrated, and semi-liquid, and perfectly soluble.

Special Indication:—

In Infant Feeding, to humanise cow's milk and prevent constipation.

Full particulars, together with complete Feeding Tables, giving the proportions of milk and water for different ages and periods of feeding, as also samples of "MALTINE," may be obtained free of charge by Medical Men on application to the Company.

"MALTINE" WITH IRON.

ıch Fluid Ounce contains— IRON PYROPHOSPHATE ... ... 8 grains.

This is a particularly bland and assimilable preparation of Iron, in which e astringency of the ferruginous salt is counteracted by the slightly laxative action the "MALTINE" base.

ıe Special Points in reference to this preparation are:—

1. Pyrophosphate of Iron is one of the most efficient chalybeates, being free from disagreeable taste, and, owing to its solubility, readily assimilated.
2. The laxative action of the "MALTINE" counteracts the constipating influence of the iron.
3. The "MALTINE" base stimulates nutrition, aids digestion, and furnishes the blood with immediately available proteids and other food elements.
4. The irritating effect on the digestive organs, which is one of the disadvantages of most ferruginous preparations, is overcome in this combination.
5. If administered in sherry wine, in the proportion of one part to three parts of wine, it will be found far superior to the ordinary iron and wine tonics.
6. It is indicated as an auxiliary in Anæmia, Chlorosis, Scrofula, Dyspepsia, Neuralgia, and all cases of imperfect nutrition, where iron is deficient in the system.

The word "MALTINE" is our Trade Mark.

In prescribing please specify "MALTINE COMPANY."

E MALTINE MANUFACTURING COMPANY, Limited,
183, ACTON VALE, LONDON, W. 3,
Will be pleased to send Samples Free of Charge to Medical Men. 25

COMBATS SERIES, 170—SIAMESE

TRADE MARK 'TABLOID' BRAND 'IODICIN' TRADE MARK

(Calcium Iodo-ricinoleate) Grain 3, Capsule

For Iodide Treatment without Iodism

Ideal for prolonged treatment. Causes no gastric disturbance. Promises well in syphilis, goitre, rheumatism, sciatica, etc.

Supplied in boxes of 50, at 3/0 per box

TRADE MARK 'TABLOID' BRAND 'LODAL' TRADE MARK

(6:7-Dimethoxy-2-methyl-3:4-dihydro-isoquinolinium Chloride). Grain 1

Reliable Uterine Styptic

Contracts the uterus, raises the blood-pressure, slows the heart-beat. Highly effective in menorrhagia, dysmenorrhœa not due to fibroids, and at the menopause.

Supplied in bottles of 25 at 1/6 and 100 at 5/0 per bottle

TRADE MARK 'TABLOID' BRAND 'EPININE' TRADE MARK Compound

For the Throat and Voice

Has a bracing effect upon the pharynx and larynx, due mainly to 'Epinine,' a synthetic hæmostatic akin to Adrenalin.

Supplied in bottles of 25 at 8d., and 100 at 2/0 per bottle

℞ 'Epinine' .. .. gr. 1/1000
Heroin Hydrochloridi gr. 1/100
Pulv. Ipecacuanhæ gr. 1/50
Acidi Benzoici .. gr. 1/40
Ol. Gaultheriæ .. min. 1/30

TRADE MARK 'KHARSIVAN' BRAND Salvarsan

AND

TRADE MARK 'NEOKHARSIVAN' BRAND Neosalvarsan

Distinguished in the official report of the Royal Commission on Venereal Diseases, 1916, as successfully replacing their German equivalents.

Approved by the Local Government Board for issue under the Public Health (Venereal Diseases) Regulations, 1916.

Supplied in hermetically-sealed containers:—

'KHARSIVAN'	.. ..	0·1 gramme 0·3 gramme 0·4 gramme 0·6 gramme
'NEOKHARSIVAN'	..	0·15 gramme 0·45 gramme 0·6 gramme 0·9 gramme

Prices on request

TRADE MARK **'WELLCOME' Brand Creosote and Camphor Basis** (Melting-point 15°C.) for use with 'NEOKHARSIVAN' in intramuscular injection.

Supplied in 2 oz. jars at 2/6 each

British-made at the 'Wellcome' Chemical Works

Battle scene from an ancient Siamese-Cambodian bas-relief. The warriors fight with bow and arrows—two of the latter being taken from the quiver at a time and shot in quick succession—and with spears or lances which are carried point downwards and are either hurled or used for thrusting. One spear is seen to have a curved point, a not uncommon form of the weapon in these sculptures. Some of the warriors carry small round shields. The helmets are of various forms, some of them recalling those of the ancient Romans. The chiefs are in the characteristic Siamese attitude for chariot-fighting: one foot is in the chariot while the other rests on the back of one of the horses where a pad helped to maintain it in position. Date, A.D. 1100-1200.

HOEFFTCKE'S EXTENSION APPLIANCES.

Ambulatory Treatment of Fracture of the Limbs; Tuberculous and Arthritic Disease of Joints.

By C. A. HOEFFTCKE,
7, Harley Street, London, W. 1.

(*Continued from Sept. 8th.*)

WHAT IS ARTHRITIS?

DISEASES of joints are mainly either of tuberculous origin or either septic, such as gonorrhœal, staphylococcal, streptococcal, or coliform.

Many of the latter group are vaguely called rheumatoid. On closer examination some of these cases may have their origin traced to some overlooked primary focus of infection, tonsil, teeth, intestine, &c. In others the cause is not traced satisfactorily.

The exciting cause of the disease in the joints can in the majority of cases be traced to an injury. At the time of the injury the joint is painful; the patient prevents the slightest movement. The blood-supply which has to bring the recuperative substances to the injured part is slowed down through non-exercise of the joint and offers a fair field to the invading bacilli.

A suitable vaccine or counter-irritation by means of massage, electricity, passive or active movements, may heighten the power of resistance in the blood, and by this means effect a cure, especially in very early cases.

When the disease is in a more advanced state and cartilage or even the bony surfaces are attacked the case seems almost hopeless. The pain does not allow the joint to be moved, the muscles contract through the patient's endeavour to bring fresh surfaces of the joint in contact, and deformity is the result. If the tension of the muscular tissues can be released and the joint surfaces pulled apart, in other words, if the joint is extended, the pain ceases and the joint can be moved. The normal blood-supply can be restored through the upright position of the body and exercise, and the joint surfaces recover, and so effect a cure.

To maintain extension between the joint surfaces many appliances have been invented, amongst which Sayres', Hessing's, and Thomas's splints figure prominently, but in all these the pubic bone has to bear the greatest pressure, which is painful; in consequence, the patient contracts his muscles and defeats the object of the appliance—namely, extension.

I claim for the appliance which I have invented that the weight of the body and counter-extension point is transmitted entirely upon the tuberosity of the ischium, which is adequately protected by the gluteal muscles, leaving the pubic bone quite free from pressure, so that the patient is enabled to walk and bear a continuous extension equal to 20 pounds or even more without discomfort.

The absence of pain in the joint when extended, the upright position of the body, and exercise improves the general health, which is also a mighty factor in the combating power of the blood-supply.

The ambulatory treatment with Hoefftcke's Extension appliance for tubercular and arthritic joints, and also for fractures, has been described and illustrated year by year since 1913 by eminent surgeons and physicians in the leading medical journals, showing the excellent results which can be obtained by its application.

To make a comparison between the conservative treatment by means of rest and Thomas's splint and my ambulatory treatment I cite the following case, one out of a good many.

Miss R. A. Tuberculous hip.

Treated at first with weight extension in bed and afterwards with Thomas's splint for nine months by two of the leading surgeons of the Royal Orthopædic Hospital.

At the end of this time there was apparent shortening of about two and a half inches and an X ray photograph showed the head of the femur to be partially absorbed.

Another opinion was taken and my ambulatory treatment advised.

As soon as my Extension splint was applied the child commenced to walk and the general health improved rapidly.

After a time it was decided by the surgeon in charge to overcome the adduction. The patient was taken into Great Ormond-street Hospital for Children in the beginning of October, 1914.

The senior consulting surgeon subcutaneously tenotomised the adductors, and I manipulated and abducted the joint on my Extension table under an anæsthetic and reduced the shortening from two and a half inches to three-quarters of an inch. I then put the pelvis and both limbs in the abducted position into plaster, taking care not to release the extension, even for a second, during the operation or subsequent treatment, which is most important.

Three days afterwards the temperature was normal.

A fortnight afterwards I took the plaster off and adjusted my Extension splint to the improved position.

A week after the patient was discharged from hospital, walking well without the slightest pain with fair movement in the hip-joint.

My splint was worn until April, 1916, when it was taken off at night, and in September, 1916, it was taken off altogether. The shortening is still three quarters of an inch, which is not noticeable in walking. Instead of the patient having the usual stiff hip, with considerable shortening and a high-boot, the result now is that after having been under my Extension treatment for two years since the operation the child is able to dance and jump about as well as any other healthy one, with perfect movement in the hip-joint, and has done so for the last year without any artificial help and without recurrency of the disease.

Many arthritic and tuberculous hip- and knee-joints have been treated in this way, with equally good results, of which I shall be glad to give particulars to any inquirers.

(*To be continued Dec. 15th.*)

Bradshaw Lecture
ON
THE CAUSES OF DISEASE.

Delivered before the Royal College of Physicians of London on Nov. 8th, 1917,

BY ERNEST S. REYNOLDS, M.D. LOND., F.R.C.P.,
LIEUTENANT-COLONEL, R.A.M.C.(T.); PROFESSOR OF CLINICAL MEDICINE IN THE UNIVERSITY OF MANCHESTER; SENIOR PHYSICIAN TO THE MANCHESTER ROYAL INFIRMARY.

MR. PRESIDENT AND GENTLEMEN,—I am deeply sensible f the honour which has been done me in asking me to give ie lecture to perpetuate the memory of Dr. William Wood radshaw. Some of the details of his life were given by my redecessor, Dr. Newton Pitt, in 1910, who describes him as ultivated, refined, but somewhat eccentric. He must have een much appreciated by his contemporaries, for he was ranted a degree without examination by the University of xford in 1847, was elected a Fellow of the Royal College of urgeons of England in 1854, and a Member of this College 1 1859.

INTRODUCTORY.

I often think that benefactors who endow lectureships ust possess a grim sense of humour, for they make at least ne person once a year come to a block in the busy traffic of edical practice and cause him to think and, worse still, to t his thoughts into cold, relentless print. In the strenuous mes in which we live at present a complete block is impos- ble, and as a result one's thoughts are constantly jostled; id this must be my excuse for the many imperfections of is lecture, in which I have found it beyond my powers to ach the high standard set me by my predecessors.

I have chosen for this lecture the old but none the less portant subject, the Causes of Disease. I shall probably ve nothing new to say, but in the exploration of the many w forests into which modern medicine has led us, with its any new names and many new methods, it is well to avoid t being able to see wood for trees. If the money expended id the labour involved in the administration of the National surance Act had been used to combat causes instead of fects, for my part I think it would have been ultimately of eater good to the community. If causes were more care- lly considered there would not be the discreditable evidence often given by members of our profession in the Law urts, especially in cases under the Workmen's Compen- tion Act. If causes were more carefully weighed we should t have the ultra-specialist assigning the majority of diseases causes peculiar to his specialty, the neurologist treating a atica really due to an impacted uterine fibroid tumour, the næcologist or the nasal surgeon performing operations on urotic patients the seat of whose troubles is really in the ain; nor the abdominal surgeon operating for gall- nes when the patient is suffering from periodic bilious miting due to migraine; nor hear of successive operations another patient on the colon, appendix, duodenum, and ll-bladder to cure pains due to the gastric crises of tabes rsalis; nor advising the removal of a supposed gastric ncer because the patient was suffering from the wasting of aves's disease—all instances which have recently come my own notice.

My thoughts have been specially directed to this subject causation by trying to discover the cause of that very tressing and prevalent affection, disseminated sclerosis, which more anon, and also by reading a recent small ume by our colleague, Dr. Mercier, entitled "Causation d Belief," a book, if I may say so, of excellent merit, and, course, of much clarity and infinite wit, and which, I nk, should be read by every medical man.

DEFINITION OF DISEASE.

We must first have some definitions. I have been prised to find no definition of disease which seems isfactory. It is obviously the converse of health, ich is defined by Professor Adami as a state stomary to a series of individuals in which they per- m their functions easily and unconsciously. But much more than this is necessary to constitute health. A man with much increased blood pressure, another with compensated mitral disease, and a third with glycosuria may all perform their functions easily and unconsciously, but they are not healthy and would be rightly refused for life assurance. The changed anatomy and function of organ and tissue are of paramount importance as well as the man's feelings and present abilities. But in this connexion we are at once confronted with two difficulties. First, there is no such thing as a standard man, as no two people even of the same race or same family are exactly alike; but we can without difficulty imagine an average man who is a mean between others varying but little in structure and function. The second difficulty is that of advancing years, for after reaching a state of maturity a man's tissues and functions change and decline. Now, I should be sorry to include these changes as disease, to imagine that all of us over 50 years of age are in a state of disease. These changes are natural processes, like the falling of the leaves in autumn, and may be defined as those changes found on an average at any particular age in a particular race; it is partly on these normal average changes that tables of expectation of life are constructed. Abnormal changes due to age are, of course, those that occur years before they occur in the average man—the early whitening of the hair, early degeneration of blood-vessels, early changes in nerve tissue, and so on.

These two difficulties set aside, I think we may safely define *Disease* as that condition of an individual in which there is, apart from normal age changes, a harmful change of the structures or functions or sensations usually found in the average man of any particular race. This definition will include neurasthenia and hysteria amongst diseases, but will not, of course, include malingering.

DEFINITION OF CAUSE.

As regards Cause, the best definitions I know are those of Dr. Mercier, whose views I will put as shortly as possible. He first defines *Effect* as a change connected with a preceding action, or an unchange connected with an accompanying action (such as the unchanging steady movement of an engine) on the thing changed or unchanged. A *Result* is the changed state of a thing on which the effect has been produced. Endocarditis of the mitral valve is the effect of the action of germs on the valve; mitral stenosis is the result. A *Cause* is the action or cessation of action connected with a sequent change or accompanying unchange in the thing acted on. He then makes a strong point about the difference between cause and *Condition*. The latter is a passive state of or about the thing acted on by a cause and material to the effect. It may be a favouring condition where more of an effect will be produced by a cause if the favouring condition is present; or a necessary condition where an extra effect or an earlier effect is produced when the necessary condition is present.

Dr. Mercier points out that age, sex, race, time of year, and climate are frequently put down as causes of disease. But these are not actions but are passive states and are therefore not causes. The age of 60 years, the female sex, the negro race, the winter, the climate of Uganda are not causes of disease, but they are conditions in which certain actions especially or only occur and are therefore favouring or necessary to the effect produced. Strictly speaking, this is correct and in the close investigation of causes must be fully allowed for. But in a wider sense condition may be for convenience included in all the necessary circumstances precedent to an effect produced and in this sense Dr. Mercier himself recognises the term in his chapter on the causes of death.

METHODS OF ASCERTAINING CAUSES.

We must now consider shortly the methods of ascertaining causes. The five canons of inductive logic put forward by John Stuart Mill Dr. Mercier clearly shows not only to be unsatisfactory but often useless and often absurd and in their place he gives 12 methods which are worth quoting:—

1. Instant sequence of the effect on the action.
2. Subsumption of the case in hand under a general law.
3. Assimilation of the case in hand to a known case of causation.
4. Association of the action with the effect when other material action can be excluded.
5. Association when the association is of proved constancy.

6. Association when, though inconstant, the association is more frequent than casual concurrence will account for.
7. Association when, though itself inconstant, the associated effect has constant peculiarities.
8. Concurrent and proportional variation of the action and the effect.
9. Common rarity of the action and the effect.
10. Correspondence of a quality in the effect with a quality in the agent.
11. Coincidence in space of an action or a condition with the effect.
12. Coincidence in time of the action with the effect.

Instances of these methods are of course given by Dr. Mercier, but all of us can quite easily find instances in medicine, and can see the value of the methods in ascertaining the causes of disease. In many diseases in which the exact cause is not known, such as measles, Hodgkin's disease or tetany, we may make shrewd guesses by the use of these methods. But in other diseases, such as true tic-douloureux, spleno-medullary leukæmia or sclerodermia, we have not sufficient knowledge of antecedents and no similarities with other conditions, so that at present no cause can even be guessed at.

Of the many fallacies found in trying to ascertain cause, one of the commonest is the *post hoc propter hoc* argument. This may be and often is perfectly true in the sense that a cause precedes an effect. But to be true a connexion must be shown to be established by one of the methods of causation "between the action that is *ante* and the effect which is *post*." But it cannot be too strongly asserted that mere sequence does not establish causation. A man strains himself while lifting a weight; he continues his work, perhaps, with some difficulty; two days afterwards he commences with pneumonia and dies, and a claim for compensation is put forward, and it is often most difficult to persuade a lawyer that there is no necessary connexion between the original slight injury and the death. A man cleans out drains from a dye-works and gets chrome eczema and chrome holes on the hands. He happens to vomit the same day that he cleared the drains; he continues to have dyspeptic symptoms and occasional vomiting and loses flesh, and a few months after dies from a gastric cancer, and without being able to show the slightest connexion (except mere sequence) between the injury to the hands and the gastric cancer a claim is made for the death. But it is common knowledge that legal compensation actions abound with such cases; and there is no doubt that the supposed efficacy of many drugs is falsely based on the *post hoc propter hoc* argument, the real healer being nature.

Coincidence.

Another fallacy, which is of such enormous importance that I think it worth while to dwell on, is that of pure coincidence. It depends, of course, principally on the fact "long ago pointed out by Bacon that there is in the human mind a peculiar tendency to dwell on affirmative and to overlook negative instances" (Fowler's "Inductive Logic"). To my mind this is the explanation of most of the curiosities of telepathy, thought reading, "dreams coming true," and of psychic research, and not unfrequently is the explanation of things being falsely ascribed as causes of disease. The number of coincidences in life is actually enormous, but relatively is only a very minute fraction of the myriads of thoughts, dreams, and sensations which continuously crowd our daily life awake and asleep. Think of the innumerable incidents which fall on the eye and the ear in a walk through the city; to the great majorty of these we pay no heed, but immediately one incident fits in with another a coincidence is established; we fix on this and remember it and very often call it, instead of a pure coincidence, an act of causation. Let me give some examples of pure coincidence.

On the morning of Feb. 14th, 1876, Elisha Gray registered his patent for a telephone at the Washington Patent Office; on the afternoon of the same day Graham Bell, quite independently in every way, registered his patent for a telephone in the same office. A few years ago a friend of mine was reading Canon Gore's book "Lux Mundi"; in order to keep the back clean she picked up from a table near by the discarded paper cover of another book and put it on the one she was reading; shortly after it was found that the paper cover's title was "The Light that Failed" by Kipling. A few weeks ago I casually opened a periodical lying on a hotel table and fronting me was a coloured print of Constable's Haywain; a few minutes afterwards I opened a box of cigarettes and in it found a print of the same picture.

In professional life coincidences are common; we all have "runs" of particular cases, or cases from particular districts or from particular doctors.

Four years ago I remember three cases of myasthenia gravis at one time in the Manchester Royal Infirmary, two of them being under my own care. About the same time I saw three cases of Bence-Jones's albumosuria within a few months. Recently I saw two cases of unrelated Thomsen's disease in one week, and the next week a case with all the usual signs of Thomsen's disease which had apparently come on after shell shock, but in whom I found no family history. A few weeks ago late one night I wrote a medico-legal report on a case of death from pulmonary embolism occurring in a man whose left tibia had been fractured by a falling stone while he was at work; the first case I saw the next morning was an officer with a pulmonary embolism from a fractured right tibia due to gunshot.

Coincidence or Causal Connexion?

In these cases of pure coincidence I am told by a mathematical friend that there is no formula which applies to them. Percentage is no test. Suppose the same 1000 persons to start at different times of each day from the East-end of London, walking at different speeds, and another 1000 to start from the West-end; the number of times each year that John Smith (coming from the East) will meet Thomas Brown (coming from the West) at St. Paul's may be quite considerable, and if no causal connexion can be shown will be pure coincidences. But William coming from the East may meet Mary coming from the West at St. Paul's only on two occasions, although each one passes that spot each day, but if the two meetings were pre-arranged by themselves or their friends the meeting is an act of causation. Similarly in disease; we sometimes find epileptics who have mitral stenosis, but these are two very common affections and are certain to meet as pure coincidences in the same individual fairly frequently. Trench fever is common, so are lice on the bodies of soldiers; and in the same way it must not be necessarily assumed that lice are the sole carriers or in any way the carriers of trench fever, although they may be one method of conveyance. I have seen a very great number of cases of disseminated sclerosis since the commencement of the influenza epidemic in 1889, but one must not assume that influenza is of necessity a cause of disseminated sclerosis.

Let us take now low percentages. Late nervous affections of the tabetic or general paralytic type are said to occur in about 7 per cent. of all persons who have had syphilis. Yet no one doubts the causal connexion for two reasons: first, that the observations are being constantly corroborated; and, secondly, that it conforms to the methods of ascertaining causes. In the epidemic of arsenical beer poisoning in the Manchester district in 1890 I had about 1200 cases of arsenic poisoning under my care; amongst them I had 16 cases of herpes, only 1·3 per cent. Was this a pure coincidence or was there a causal connexion? The latter certainly, for as a matter of fact, knowing that others had found herpes in arsenical poisoning, it was the presence of herpes which made me look for the arsenic. Actual pain and fine tremors are very rarely indeed found in lead-poisoning. Personally I have only seen these symptoms in two or three cases; but I have no doubt that there is a causal connexion, because others have seen them, though rarely; and, knowing that lead will cause motor paralysis, it is not unreasonable to suppose that it may rarely cause pain and tremor. Perforating ulcer of the foot I have only seen, I think, twice in diabetes mellitus, but I have no doubt it is secondary to the neuritis and changes in the sensory roots of the spinal cord found in that disease. Some years ago I published in *Brain* an account of four families in two or more members of which disseminated sclerosis occurred. Since then I have had no fresh instances of familial incidence in this disease, and, although the disease is common, hardly any other observer has noted it as a possible family affection; therefore I am inclined to believe my cases were more or less coincidences. I also published a note in the *British Medical Journal* of instances in which I had seen disseminated sclerosis and Graves's disease in the same person; here, again, no corroboration being forthcoming, I think I was dealing with pure coincidence.

Diseases and Primary Causes.

A glance through any text-book of medicine will reveal an enormous number of diseases with particular "names." This

is as it should be; for without such large numbers of names we could not carry on our personal observation of diseases nor could we communicate our thoughts to others. For old *as it is* I do not think that Hobbes's definition can be too often repeated, that "a name is a word taken at pleasure to serve for a mark, which may raise in our mind a thought *like* some that we had before and which being pronounced to others may be to them a sign of what thought the speaker had or had not before in his mind." (And I should like, in an aside, to say that I consider it an unwarrantable crime for old names to be altered or used in different circumstances without very full justification. "Cursed be he that removeth his neighbour's landmark.") A further study of all these diseases will show, however, that the things that cause them can be narrowed down to a comparatively few classes, so that from a purely prevention point of view the number of actual diseases, considered as primary and not as regards their final effects, is similarly few. For instance, most diseases of the heart are not primary, but are the final results of some infective process; the same thing applies to most glandular affections; liver diseases are often circulatory or due to some poison; very many brain affections are due to circulatory troubles, and diseases of vessels to premature old age, and so on with any other system, the skin, the kidneys, the lungs, or the spinal cord. One has only to think of the numerous diseases set up by three primary causes—alcohol, tubercle, and syphilis—to realise the truth of this.

As an example of remoteness of cause and effect the following may be given.

A few weeks ago I was asked to see a lady who had recently been operated on successfully for an hour-glass stomach. But she insisted that she could not walk and remained bedridden. I was told this was due to hysteria, presumably post-operative. A short examination showed that she was a marked example of combined postero-lateral sclerosis which had been slowly coming on for two years, and was a remote effect of an original gastric ulcer with subsequent alimentary disturbances and anæmia.

A Healthy Community: Probable Diseases.

Let us suppose 1000 healthy men and 1000 healthy women, each aged 20 years, free to marry, with no hereditary taint, put to live in a perfectly healthy island with sufficient flora and fauna to maintain life, and not under a fantastic communistic government, and let us try to imagine from what diseases they will suffer and from what they will die.

Theoretically we may suppose that none of these people will have any disease, and that they will all die aged 70 years owing to the natural processes of age. But as practical physicians, not treating human beings as pure pieces of machinery, we know that no two human beings are exactly alike either in structure, functions, habits, or feelings, and this being so every person responds differently to his surroundings, and therefore some of the inhabitants of our island will suffer from various affections and the ages at death will vary considerably. It will facilitate my suppositions if we agree to include in our study not only the original 2000 inhabitants, but also the next two or three generations, without, of course, any admixture from the rest of the world.

Injuries.

Injuries will inevitably occur. Of purely so-called surgical injuries, varying from burns to fractured skulls, I need not further speak. We must also include injuries due to childbirth, those to the mother and those to the child, the latter partly asphyxial but principally resulting in the many cases of birth palsy, and not unfrequently in some types of epilepsy and perhaps of mental deficiency. Epilepsy in adults, osteo-arthritis, and probably new growths, are often more end results of previous injuries or irritations. Cold and heat applied externally may, of course, cause injuries, whether they result in frostbite or in burns, and it is not unreasonable to call them injuries when they produce other effects. Heat will cause heat syncope, and the sun will cause that form of sunstroke called by Sir Patrick Manson "sun traumatism." I particularly wish to dwell for a moment on the effect of cold. We are all, I think, prepared to admit that "getting cold" produces a condition of lowered vitality which allows certain germs to act and effects occur, and in our broad use of the word *cause* cold would be a cause of these diseases. But apart from germs, will cold or chill cause disease? Personally, I think it may. Take the case of a man who has been "wet through" and had to remain in his wet clothes until he felt chilled. I am prepared to believe, until fresh evidence is forthcoming, that he may as an effect have a parenchymatous nephritis, in a pure case of which I know no evidence which connects it with a germ growth. Again, I am a firm believer in the bad effects of a "draught." The breezes of a mountain top may harm no one, but sitting in the draught from an open window is, to my mind, a pernicious habit. It not only may for the time lower resistance, but can undoubtedly, quite apart from germs, so far as evidence goes, cause facial paralysis and brachial neuritis. I have seen paralysis of muscles supplied by the external popliteal nerve so caused, and in one case a paralysis of the muscles supplied by the fifth cervical root, and I think it likely that many cases of sciatic neuritis are due to cold pure and simple.

Food.—Poisoning.

Food being of prime necessity, I will consider it next. Results of improper feeding will sooner or later appear on our island. Practically each person will differ from every other in the quantity and quality of the food he takes. Some will naturally require more food than others; some will have healthy or unhealthy likes or dislikes for certain foods; others will have food idiosyncrasies; others, according to inclination or opportunity will take too much food, others too little, and so will arise obesity (the commencement of many diseased conditions) or emaciation. Probably many abnormalities of blood pressure are due to improper feeding. Some will bolt their food, causing dyspepsia of various forms. Some may get diarrhœa, others constipation, with its many undesirable effects; but few physicians will, I think, be prepared to accept the formidable and curious catalogue of the effects of intestinal stasis as tabulated by Sir Arbuthnot Lane. From improper proportion of food stuffs some may develop scurvy and others (in infancy) rickets.

Cases of poisoning will certainly occur on our island, gaseous, liquid or solid from animal, vegetable, and mineral sources, and we must include poisoning from putrid foods. We may concede that tobacco smoking is indulged in, and we may get various acute, and more important still chronic, effects from over indulgence, effects which are commoner than is usually supposed. Sooner or later alcohol will be distilled and taken, and at once we add enormously to the number of diseases produced, with possibly also effects on the offspring. Here may also be mentioned poisoning from intrinsic sources, such as presumably may be the cause of pernicious anæmia, rheumatoid arthritis, combined postero-lateral sclerosis, possibly of disseminated sclerosis, and the numerous diseases resulting from altered secretions from glands, ductless and otherwise; some of these poisons may originate from germ growth, others from altered functions and altered metabolism, two classes to be considered later.

Occupation.—Stress.—Metabolic Variations.

Our islanders must, of course, work. If we suppose the work is agricultural, and if more or less evenly divided, no special diseases should arise therefrom. But sooner or later some will work less than others either from getting unduly rich or because of indolent habits. The former may become obese and indulgent, the latter will suffer the usual penalties of underfeeding and also perhaps of depleted homes and of overcrowding, with their usual results to themselves and their children. Sooner or later also other industries will arise which will again by degrees become more and more specialised, and we are at once introduced to the numerous diseases of occupation about which so much excellent work has been done in recent years.

With increased work there will develop (partly as a result of competition, partly of habit and partly of necessity), worry, hurry and stress, often much increased by the tyranny of the insistent telephone and the irritation of the rushing wheel. Stress especially affects the digestive, the circulatory, and the nervous systems. The affections set going by improper or insufficient food, by hurried and irregular meals, by hyperchlorhydria (often, I think, the result of worry and rush) and by constipation I have already touched upon. Functional affections of the heart, tachycardia, palpitation, and actual cardiac dilatation may result from stress. More important still, as leading to so many affections often in the end fatal, we get the increased blood-pressure which in industrial communities is so enormously common and tends to early unnatural

senility. Equally common are nervous affections, hysteria, neurasthenia, psychasthenia, and insanity. I believe that acute congestion of the brain may occur causing prolonged unconsciousness or even delirium, and for my part I am inclined to think that Graves's disease is primarily a nervous affection and not primarily a disease of the thyroid gland. It is a difficult question to decide whether these acquired results of stress are handed down to appear as nervous symptoms in the offspring, for it may be that these results would only appear in certain members of our community who are of a more nervous temperament than the others, and that it is merely the temperament which is handed down. Perhaps some signs in the children may be the results of imitation from living in a household where rush and stress are always occurring. One type of stress, not, I think, sufficiently dwelt on, is that caused by nursing sick relatives through long illnesses, especially when the illness ends fatally. This, of course, occurs principally in women, and is one of the most potent causes of functional nervous disturbance that I know. It is one of the tragedies of life to see a woman gradually becoming more worn, more faded, and less likely to marry as the result of being tied hand and foot to another's sick-bed; and the worst of the tragedy is that very often it is inevitable and "none can succour her."

We have assumed that each of our inhabitants differs from the other, and therefore we may further assume that each will functionate and metabolise differently. For some unknown reasons these alterations in function and metabolism may lead to diseased conditions. Such are obesity, diabetes mellitus and insipidus; gout, hyperchlorhydria, and some altered digestive processes, including constipation; altered functions of the ductless glands, and possibly the tendency for certain secretions and excretions to form calculi. Some altered blood conditions, such as chlorosis and polycythæmia rubra, belong to this group.

Age.

We must now consider abnormal changes due to age. It is permissible here to include congenital affections (apart from those due to injury), many being due to abnormal or arrested development. Later changes may be either general or local. General changes seem to fall more especially on the circulation, leading to diseases of the heart and blood-vessels, with subsequent affections of the brain and spinal cord, with simple-mindedness, loss of memory, definite mental disease, brain and cord softenings, and hæmorrhages. (I would like to draw attention at this point to senile paraplegia from deficiency of circulation in the lumbo-sacral cord described by Sir William Gowers, and not, I think, sufficiently recognised.) Together with these vascular changes must be included the granular kidney, with its multitudinous range of symptoms and signs.

Local changes may affect many organs. Those of the hair and skin are obvious. In the nervous system I would include the following diseases: paralysis agitans, senile tremor, adult chorea, amyotrophic lateral sclerosis, progressive muscular atrophy, and chronic anterior poliomyelitis; amongst mental affections certain of the incurable adolescent insanities which rapidly pass into incurable dementia and various senile insanities. Early degenerations of ductless glands are manifested by myxœdema, and perhaps by some types of Addison's disease; early senile changes in the sexual organs by an abnormal menopause, early loss of sexual power in men, and by early changes in the prostate gland. Early changes in the eye may cause too early errors of refraction or affections of the lens, while changes in the ear may set up deafness or labyrinthine vertigo or tinnitus.

The important point about all these affections is that they are absolutely incurable. In the case of myxœdema the symptoms and signs can be removed by drugs, but the condition on which the symptoms depend remains the some.

Neoplasms.

We must now consider the question of neoplasms, and I will take Dr. Powell White's definition that a neoplasm is an abnormal mass of cells, tissues, or organs resembling those normally present but arranged atypically; it grows at the expense of the organism without subserving any useful function. Teratomata due to faults of development will almost certainly occur in some of the descendants of our original islanders, and also, one must suppose, as no two of our community are alike, that simple tumours will occur, such as warts, moles, fatty tumours, outgrowths of bone or of cartilage. But what shall we say of malignant tumours? Such are not always hereditary, and no one has yet proved that they are in any way caused by germs. So far as I have been able to observe, the commonest antecedent of large numbers of malignant growths is injury, including, of course, irritation. If we say for the sake of argument that it is a cause then we must, I think, certainly admit that malignant growths will occur in our island. But there is obviously something else: everyone suffers, if not injury, then certainly irritation, even if it is only the daily passage of fæces. But not everyone suffers from malignant growth, the unexplained factor is either another cause, or much more likely some condition. So important does this seem that I would urge that research workers on the etiology of new growths would do well to turn aside from the search for the active cause and seek out the condition which allows the active cause to produce its effect. If this necessary condition, whatever it is, cannot occur on our island we shall have no malignant growth and the contrary.

Parasitic Diseases.

I think we must assume that our island will not be free from parasitic diseases. It may be conceded that it is an island in a temperate zone, so that we have not to consider those greatest advances of modern medicine conducted often under enormous difficulties, discomfort, and danger by our brethren in tropical countries. I am not sure that we can exclude flies, fleas, bugs, and lice from the fauna of the island, however glad we should be to do so, and they may act, not only as direct irritants, but as disease carriers. Other animal parasites such as the itch insect and the various intestinal worms we may reasonably exclude.

Diseases due to Micro-organisms.

We almost certainly cannot exclude germs, for even in non-pathogenic states they are apparently necessary for the continued existence and for the decay of plants and animals. No one knows how the first germ started, but the more one wonders how the first germ became pathogenic the more fascinating does the subject become. I greatly regret that my ignorance of modern bacteriology will not allow me to discuss the matter as I should like, but I venture to refer to the interesting address on "The Nature and Degree of Specific Differences amongst Bacteria" given by Dr. Andrewes to the Pathological Section of the Royal Society of Medicine on Oct. 21st, 1913.[1] There he points out that generic differences amongst germs are probably of great antiquity, and that certain small genera, such as *Bacillus anthracis*, *Bacillus mallei*, *Micrococcus melitensis*, are very fixed, but that other large genera, such as the streptococci, the diphtheroids and the coli-typhoid group, are very variable and show a readiness to gain or lose their physiological characters under the direct influence of their environment and that in many cases by artificial means a non-pathogenic germ may become pathogenic and vice versa. This subject was also fully dealt with by Professor Adami in his recent Croonian lectures, in which striking examples were given.[2]

It is highly probable that we all keep on the premises, so to say, what I will call domestic germs, which, as a rule, remain tame, but granted certain conditions of the host, such as starvation, fatigue, or exposure to cold, they become wild and cause disease. Such, for instance, are probably the *Micrococcus catarrhalis*, the pneumococcus, the staphylococcus, the *Bacillus coli*, and the germ of rheumatic fever.

Other germs, such as the tetanus bacillus, the *Bacillus aerogenes capsulatus*, and many of the bacteria of putrefaction, perhaps normally present in the soil, only become pathogenic if they are put into suitable surroundings. I am told that there is a possible family connexion between a bacillus growing in Timothy grass, through the bovine to the human tubercle bacillus. Other bacteria and protozoa may live in perfect harmony with their hosts (such as *Bacillus pestis* in the rat-flea and certain protozoa in insects and birds), but are highly pathogenic in man.

Other micro-organisms living in the human body belong to groups which seem to have their members closely allied, but in which some are non-pathogenic, others highly pathogenic, and in which quite possibly the latter may have arisen from the former. Such, for instance, are certain organisms of the throat and nose closely resembling Weichselbaum's bacillus, and, again, the enteric group, varying from *Bacillus faecalis alkaligenes* to Gaertner's bacillus, the paratyphoid, and the typhoid bacillus.

[1] THE LANCET, 1913, ii., 1239.
[2] THE LANCET, 1917, i., 921, 961; 1917, ii., 20.

So that although we may not allow that certain very fixed types such as the germs of syphilis, measles, scarlatina, or small-pox would affect our islanders without introduction from overseas, it is reasonable to suppose that many diseased conditions due to germs may arise within.

Heredity.

The last class of possible causes of disease is heredity. Our 2000 persons we have supposed to be free from inherited taint. Is it possible for any of the first generation of their offspring to inherit disease conditions or tendencies owing to the habits or environment of the parents? This question has been so fully dealt with in Professor Adami's recent Croonian lectures and decided in the affirmative, that it is almost unnecessary for me to touch upon it, except to say that I thoroughly believe such inheritance may occur. And whether it is due to an action on the somatic plasm or the germ plasm is a matter of more or less indifference to the physician or to the hygienist, and I certainly do not propose to deal with what the late Sir Jonathan Hutchinson calls the logomachy of Weismannism. I think it quite likely that alcohol and lead poisoning in the parent may affect the offspring. Nor does it seem unreasonable to suppose that the effects of under-feeding or over-feeding may have their results in the children; or that such infective conditions as we have allowed may develop in our island should produce an hereditary lessened or increased immunity. And if we consider a few more generations we can easily see how many metabolic and nervous diseased states may result. But I shall consider hereditary disease again in a few moments.

Summary of Causes.

I have now shown how in our community of originally healthy persons and their progeny for, say, two or three generations disease may occur, and deaths at varying ages may result without any contamination from the outside world, and I have classified the causes of these results into:—

1. Injury.
2. Food and feeding.
3. Poisons.
4. Occupation.
5. Stress.
6. Abnormal metabolism.
7. Abnormal age changes.
8. Neoplasms.
9. Parasites.
10. Heredity.

It goes without saying that the percentage of deaths from natural changes due to age will be much higher than in England to-day,

Effects of Immigration.

If we now allow unrestricted immigration into the island we shall not introduce any new cause of disease, but we shall much intensify at least three of our causes—namely, stress from increased competition, parasites, and heredity. Those parasitic affections will especially act as causative agents which are of fixed types, such as syphilis, tubercle, the exanthemata, and so on, and we shall presently see what an enormous factor the parasite is in the production of disease.

HEREDITARY DISEASES.

The subject of hereditary diseases must be considered in more detail. They can be roughly classified into eight groups: 1. Direct infection, of which syphilis is the one example, though some, such as Hutchinson, are prepared to believe that tubercle may be actually conveyed into the ovum. 2. The possible results of extrinsic poisoning in the parents by such agents as alcohol or lead. 3. Structural changes. These may be the obvious external changes, such as supernumerary or webbed fingers and toes, coloboma, or albinism. Or they may be internal structural defects, such as found in hæmophilia, and perhaps myotonia congenita and amyotonia congenita should also be included; or latent structural defects which show themselves later as various skin diseases—psoriasis, lichen xeroderma, urticaria, or chilblains. For those who believe in the heredity of cancer, and I think most clinicians do, the unknown latent conditions underlying the affection may be perhaps included in this group. 4. Altered metabolism, as, for instances, gout with its numerous manifestations, of which some only may be handed down, diabetes, and obesity. 5. Idiosyncrasies to certain foods or odours. 6. Tendency to germ infection, possibly from some hereditary lessened immunity. The great example of this group is, of course, tuberculosis. But I wish to take this opportunity to emphasise the enormous influence of heredity on acute rheumatic fever, an influence which I do not think is sufficiently pointed out. To my mind it is of equal importance as regards ultimate human suffering to tuberculosis. The more one inquires into the family history of rheumatic patients the more one is impressed with the number of families in which the parents, especially perhaps the mother, and the brothers and sisters have been affected with rheumatic fever, valvular disease of the heart, with chorea, or with various very definite rheumatic skin affections, such as erythema nodosum, with purpura or with that variety called Henoch's purpura which personally I believe to be merely a manifestation of rheumatism. 7. Nervous irritability or instability. In this group we have, *par excellence*, epilepsy, habit spasm, stammering, migraine (on the sensory side), asthma, the alcoholic habit, the various types of neurasthenia and certain insanities, many being of the curable type. 8. Tendency to abnormal age changes, in which I include certain insanities of the progressive incurable type, such as incurable adolescent insanities and early senile insanities; adult chorea; Friedreich's ataxia and various types of myopathic paralysis, including family peroneal atrophy; and finally, and most important, the changes produced by hereditary increased blood pressure with early arterio-sclerosis.

Now it will be at once quite rightly argued that to call a disease hereditary does not explain its cause. The heredity is generally only a condition, and some of the other nine classes of causes have to be brought in as factors before an effect is produced. But the importance of heredity in determining the future of a race is so great that it is quite legitimate, I think, to give it a place in my list.

CONSIDERATION OF ENGLISH MORTALITY TABLES FOR 1913.

We can now suppose that by unrestricted immigration and in the course of many generations the health and disease of our island has reached the condition in which England is to-day. In dealing with this we have unfortunately only very imperfect statistics of morbidity. We can obtain roughly the number of insane and the types of insanity, a class more cared for by the State than any other; or the numbers and character of certain notifiable infectious diseases, but that is all. For other information we must turn to the mortality tables of the Registrar-General. These are notoriously imperfect, depending, as they do, on certificates of death, which are, I am afraid, sometimes so worded as to give as little information as possible. To show how little they indicate real disease incidence, only 1800 deaths are attributed to acute rheumatic fever, which with its sequelæ is one of the most potent causes of disease; only 1200 to rheumatoid arthritis, another common affection; only 2000 to syphilis; whereas 26,000 are classed as syncope, merely the final cause of death of many different diseases.

But in spite of these defects the mortality tables deal with such large numbers that some hint, at any rate, is afforded of the morbid state of the community, and they are therefore worth examination. I shall take the year 1913 (so as to exclude war conditions) and shall only give approximate figures. There was a total of 500,000 deaths.

Of these, 134,000 (over one-fourth) were due to infectious diseases directly, and to these should really be added an enormous number of deaths ascribed to heart, lung, kidney, and nervous diseases, the primary cause of which was germ infection. Of these 134.000, 50,000 (one-tenth of the whole death-rate) were due to tuberculosis in some form, 37,000 to pneumonia, 10,000 to measles, 9000 to epidemic diarrhœa, 6000 to influenza, and 5000 to whooping-cough. 46,000 were attributed to respiratory diseases (excluding pneumonia), of which 39,000 were due to bronchitis, but this is very frequently merely a terminal phenomenon. 39,000 (nearly one-twelfth of the whole) were due to cancer or other forms of malignant disease, 38,000 to disease of the blood-vessels, 30,000 to diseases of the digestive system, 27,000 to nervous diseases, 27,000 to heart disease, 26,000 to syncope (which is again a terminal phenomenon, but may include many valvular affections of the heart), 20,000 violent deaths, 15,000 to Bright's disease, and 12,000 to atrophy and debility (a classification of no value). There were 18,000 premature births. Old age is accredited with 30,000 deaths, or one-seventeenth of the whole.

As I have said, these figures give us some hint of disease conditions, but certainly nothing more than a hint of prime causes. For instance, three most potent prime causes have very low figures—venereal diseases, 2000; alcoholism, 1900; and rheumatic fever, 1770. I can understand a certain diffidence in entering syphilis or alcohol as a prime cause on a death certificate, but there seems to me to be no excuse

for not naming acute rheumatism, except, perhaps, that it is even not yet sufficiently recognised how slight, especially in children, its manifestations may be, nor that chorea in children is for all practical purposes a sign of rheumatic fever, and, finally, that the enormous preponderance of cases of organic diseases of the heart valves is due to previous acute rheumatism.

It is interesting to compare my list of causes of disease with these figures, however imperfect and unsatisfactory, of the causes of death, to imagine how many of the 38,000 deaths from disease of blood-vessels were due to abnormal old age or to stress and how many to syphilis, what proportion of the 30,000 ascribed to the digestive system was due to food and feeding, and what proportion of nervous diseases was to be attributed to germs, to stress, to abnormal old age, or to heredity.

DISSEMINATED SCLEROSIS.

A disease in which I have been interested for years is disseminated sclerosis. It is in my own personal experience almost the commonest of organic diseases of the nervous system in which morbid changes can be found. It is a most distressing malady, not only to the patient, but also to the physician, for it comes on without any known cause, principally affects those in the full bloom of life, is no respecter of persons, and has a most crippling effect for years before it causes death. In my own experience it is much more common in women.

Very frequently, indeed, much more so than is generally supposed, it first affects the optic nerve rather rapidly; this affection is generally temporary and may be followed by a long intermission, often lasting years. With or without this initial symptom sensory symptoms, often very indefinite, occur, and rarely there may be severe pains not unlike those of a definite neuritis. At the same time or later there are disorders of motion, which may be slight, like an indefinite ataxia, or much more marked from affection of the pyramidal tracts or of ascending nerve tracts; very rarely actual wasting of muscle may result. A very marked feature of the disease is the occurrence of intermissions and remissions, the longest intermission, as a rule, being between any early eye symptoms and the sensory and motor phenomena; so long, indeed, is this interval that unless closely questioned patients never mention the original eye symptoms and certainly never connect them with the subsequent symptoms.

Causation.

Pathologically the lesions are very widespread and their locality points to something distributed by the lymph in the vessels or cerebro-spinal channels, or by blood in the blood-vessels, and probably more immediately by the former. The cause, whatever it is, has a predilection for the medullary sheath and the neuroglia, which are the parts primarily affected, and apparently the chronic inflammatory changes are secondary. The astonishing thing is the very sharp limit to each diseased spot, one indeed so marked that Strümpell supposed, but not on sufficient grounds, that the disease is largely of an endogenous nature due to a congenital abnormality of those parts affected, and that in this way a multiple gliosis results. I do not think some interesting observations made by my colleague, Dr. Williamson, in his work on "Diseases of the Spinal Cord," have been sufficiently noticed. He says:—

"The shape of the patches and their regular margins in disseminated sclerosis are suggestive of the infiltration of the nerve structures with a fluid of destructive character, the margins of the patch being determined by *physical conditions*. If a spinal cord which has been hardened in Muller's fluid be touched on its external surface or on the cut surface of a transverse section, with a minute drop of deeply coloured fluid such as a strong solution of aniline blue-black, the fluid diffuses itself into the cord substance, and a stained patch is formed with a fairly regular, curved, clean-cut margin, a margin which passes through the various structures of the cord abruptly and indifferently, and thus resembles that of a patch of disseminated sclerosis. This fact is suggestive of the patches being caused by the infiltration of the nervous system with a toxic fluid, their shape and margin being determined by physical conditions."

In a footnote he adds:

"Alcohol and several other chemical fluids have the power of dissolving out the white substance of Schwann from the nerve fibres of specimens of the cord and brain kept in these fluids for long periods, whilst the axis-cylinders and other structures are left. Thus a microscopic appearance is produced on section which somewhat resembles that of one form of the sclerosed patches. This fact is of interest, though the disease has no relation to alcoholism."

I think Dr. Williamson's observations certainly suggest that the toxic agent may be in the cerebro-spinal fluid.

If we use our tables of causation of disease we can rule out injury, food, occupation, stress, age, neoplasms, and heredity; also all extrinsic poisons. But we cannot set aside intrinsic poisons, nor altered metabolisms, nor parasites growing either in the nerve tissues or forming toxins which act on the nerve tissues. It was a long time before it was proved that acute anterior poliomyelitis was due to a germ, and we do not know at the present time whether the long-drawn-out and peculiarly intermittent symptoms of myasthenia gravis are due to germs, altered metabolisms, or intrinsic poisons, the only definite effects found being lymphorrhages in the muscles and some fatty degeneration of an enlarged thymus gland; and although of recent years the *Treponema pallidum* has been found in the brain of general paralytics it seems more probable that the essential changes of this affection and of tabes are due to the toxin rather than to the local growth of the parasite.

Consideration of Possible Causes: Need of Research.

On the whole, by subsumption of the case in hand under a general law and by assimilation of the case in hand to a known case of causation, it seems certain that disseminated sclerosis is caused by a poison acting on certain special nerve tissues. If this is an intrinsic poison, which I am quite prepared to believe, it is probably either a perverted internal secretion or a poison derived from the alimentary canal, possibly as the result of constipation. In this connexion it is most important to keep in mind the postero-lateral changes found in the spinal cord in diabetes, pernicious anæmia, and many exhausting diseases. If from a germ, is it from the germ of some known fever, such as measles, typhoid fever, or influenza? I think from the previous histories this can be at once answered in the negative. Or may it occur as a late result of *any* previous germ infection independently of nature? I think this should also be answered in the negative, not so much because some of the patients say they have never had any previous germ infection (in which they may be mistaken), but more because it seems to me that from analogy it is highly improbable that a disease which in spite of its many varieties has so very distinctive a character both clinically and pathologically can be caused by any odd germ or germs which may have previously affected the patient. It may be finally noted that the disease resembles in many respects those nervous affections caused by syphilis, although we know that syphilis is not its cause, nor do the pathological changes resemble those produced by syphilis. But in its early affection of the eyes, its widespread distribution of lesions, its intermissions and remissions, and its long-drawn-out duration, the similarity is striking.

If due to a germ I am convinced it is a specific germ as yet quite unknown. Whether the intermissions and remissions are due to the continual presence of the germ in the body with varied powers of immunity from time to time or whether to fresh infection is not known. If due to an intrinsic poison the remissions would, of course, be due to the manufacture and absorption of fresh masses of poison.

I am sorry to have to confess that in spite of minute inquiries into the previous histories of large numbers of cases of this disease I have so far entirely failed to elicit any evidence of any common factor, although my questions have covered a large field. There is evidently another field to explore, and I would strongly recommend to young members of our profession that here is a subject of research well worthy of attention and in which the discoverer of the true cause will gain a rich reward.

OTHER DISEASES.

Another common and very distressing affection which needs urgent investigation as to its real cause is rheumatoid arthritis, for although I am willing for the present to admit that it is due to some toxin, this is by no means proved. Nor is it known if it is due to a germ toxin or to some intrinsic poison arising from imperfect metabolism.

Epilepsy and migraine, two very common and disabling affections, I have classed in the hereditary group; but how glad we should be to know the real cause.

Two other diseases, fortunately not common, I find a difficulty in classing—namely, spleno-medullary leukæmia and true facial neuralgia. The former seems allied to

lymphatic leukæmia, which in many respects, especially in its frequently rapidly fatal results, resembles a germ infection; but in symptoms and course spleno-medullary and lymphatic leukæmia are so different that one sometimes wonders why they have generally been described together, unless it is that both are due to the same cause, but one running a very acute course, the other a chronic one, just as may happen in some other germ diseases, as, for instance, tuberculosis or glanders.

I have narrowed down diseases from the point of view of cause into ten groups only. This may appear surprisingly small and surprisingly simple. Allowing for that latitude which is always necessary when looking at very many objects from a large standpoint, I do not think I have taken many liberties in putting any particular disease into any particular group, although I do not pretend that the classification is one strictly conforming to the logical laws of classification. But I think the grouping is a convenient one, and I trust that on testing it will be found to stand criticism, and may be helpful in enabling us to steer a true course to reach the haven of real cause, and after reaching it to perform our next and highest duty, real prevention.

THE LATER HISTORY OF CASES OF GUNSHOT WOUNDS OF THE CHEST, WITH RETAINED MISSILES.

BY ROBERT DAWSON RUDOLF, M.D. EDIN., F.R.C.P.,
COLONEL, C.A.M.C.; CONSULTING PHYSICIAN TO THE CANADIAN FORCES IN ENGLAND.

THE question of what becomes of soldiers who have been shot in the chest and in whom the missiles are still present is one of great importance, as it bears directly upon the treatment of such cases. Should such missiles be immediately removed or should they be left alone? are the questions which are being much discussed at the present time. In a general way it may be said that among the French medical officers the tendency is frequently to attack such cases surgically, while amongst the British practitioners a more conservative policy is usually adopted.

The matter can only be settled when we have sufficient data to enable us to form an opinion as to what harm such foreign bodies do when left *in situ*, and also we must know what is the immediate risk to life of active surgical interference. This war is, unfortunately, providing us with only too much material upon which to form such opinions, and in the meantime, until great masses of statistics are available, as many cases as possible may be placed on record to help in this direction.

The Present Investigation.

For some months now I have been endeavouring, at the suggestion of Lieutenant-Colonel T. R. Elliott, to collect notes of patients in the Canadian hospitals in England, who have undoubtedly got foreign bodies in the chest, as shown by X ray examinations, and, although the list is still a small one, I give it as an early contribution to the subject. A large number of cases have been seen in the hospitals who have not yet been finally disposed of, but these are not included, as it is the final fate of such cases that we wish to ascertain.

In each of the cases in the list the X ray findings are given, and it will be seen that I include all cases in which the foreign body lies deeper than the ribs, so that in some instances these are not in the lung at all, but it seemed wise to include them in the series.

It will be observed that there were only two deaths in the list, and it is interesting to note that these two patients had been operated upon for the late removal of the retained foreign body. In one of them (No. 9) an abscess had formed round the offending missile, so that in this case an operation was urgently required, but in the other instance (No. 13) the patient was apparently well, and it would probably have been wiser, as the sequel showed, if he had been left alone. In a paper in THE LANCET of Sept. 8th last, by Colonel Elliott, there is a list of 170 cases of gunshot wounds of the chest, in which the after-history had been traced, and the only case that had a fatal issue in England was one in which there had been an operation for the removal of a rifle bullet from the lung. In 51 of his cases a foreign body remained in the chest, and Colonel Elliott does not think that this increased the gravity of the prognosis in any instance.

As regards the disposal of our 50 patients, 12 have been invalided to Canada or Australia or have been discharged as permanently unfit. One was tuberculous. Two died (as already mentioned, after operation). Three were categorised as "C 3" or "permanent base duty," 4 went to "light duty," and the remaining 29 were sent to full duty, "A 3," or "Command Depôt," where they would soon be considered fit to return to their units. Thus out of the 50, 36—i.e., 72 per cent.—were fit for some military duty, and only 14 were lost to the Army. The different ways of disposing of the patients is due to the fact that some were imperial men, while the rest were from overseas.

There must now be an immense number of these cases back at the Front and on other military duty, and yet how seldom is it that they are again invalided on account of disability resulting from the late effects of the retained foreign bodies. During my work in the past year in Canadian hospitals in England, and again in such work in France for nearly two years, I do not remember having come across such a case, and my colleague, Colonel F. G. Finley, tells me that his experience has been the same over a similar period.

Nearly all soldiers who have been shot in the chest, and in whom the missiles are still retained, complain of some cough and shortness of breath and of some pain in the chest, but I cannot say that they complain any more than do those in whom the missile has passed through and through. Further, in the former case most men have unfortunately been told that the foreign body is still in the chest, and have even been shown the X ray plates, and the knowledge so acquired is bound to make them introspective and thus will retard their complete recovery.

The Question of Operation.

The question of the early removal of large pieces of, in all probability, septic foreign material is not one that can be discussed now, but I note with entire approval that Colonel Elliott thinks that such large pieces of shell and shrapnel casing in the lung should be disposed of at once, as they will almost certainly produce gross infection, with frequent severe hæmorrhage, if left alone; but with this exception it would seem well to be very chary about removing small foreign bodies, especially rifle bullets and shrapnel balls. These do not seem to do any harm if left alone, and in no way increase the gravity of the symptoms produced by other associated conditions, such as hæmothorax, pneumothorax, and actual lung lesions.

Colonel Elliott states that it would appear from recent French publications that the mortality is much higher in chest wounds than was at first supposed, and that this high mortality requires vigorous efforts on the part of the surgeons to save life. "Also, in respect of casualties who survive these wounds, evidence is brought forward to show that retained projectiles, and especially shell fragments, almost always cause trouble, either by the introduction of sepsis, or, if sterile, by the introduction of later pathological changes or symptoms that incapacitate the patient for service."

Hence it has been urged by several surgeons that all shell fragments, other than those of small size, should be removed within the first 24 hours, with a cleansing of the wound track, suture of the lung, and evacuation of blood-clot from the pleural cavity. With this rule there will probably not be much difference of opinion. But the same authors go on to advocate "the removal from the thorax of all other retained foreign bodies at a much later date when the possibility of septic complications has passed away." In my humble opinion no such routine operation is called for. There are exceptions, of course, as where such a foreign body is giving rise to active trouble. Thus, in Case 6 in our series the patient had a resection done for an empyema and a permanent sinus remained, which eventually was found to lead directly to a piece of shrapnel which lay in the lung surrounded by fibrosis. This was removed and all the acute symptoms disappeared and the sinus closed, and the patient was well on his way to recovery before he left for Canada.

Even if it should occur that these foreign bodies do commonly at a much later date produce distress, probably it would then be less risky to remove them than to do so earlier merely in anticipation of such possible trouble.

No.	Age	X ray.	Weeks before final disposal	Disposal.
1	—	Shows bullet (shrapnel) left chest at level of spine of scapula; many fragments also here.	25	C 3.
2	—	Shows pieces of shrapnel all over left side of chest.	—	Com. depôt.
3	—	Shows piece of shrapnel between 4th and 5th ribs rt. side. Piece of shrapnel upper 3rd right lung.	—	A 3.
4	—	Shows large piece shrapnel intrathoracic just on left diaphragm. Moves with respiration.	—	Com. depôt.
5	—	Shows shrapnel bullet in region of junction 11th and 12th rib and vertebra.	—	Duty.
6	22	2 pieces shrapnel, 1 large, 1 small, intrathoracic, left side, large piece just internal to 7th rib 9 cm. from vertebral border. Opacity left lower lobe. Fracture 9th rib.	—	Invalided to Canada.
7	27	Bullet lying intrathoracic left side just posterior to 5th interspace on diaphragm, point toward back. Marked opacity left base. Movement of diaphragm restricted.	—	Duty.
8	34	Shrapnel ball, intrathoracic, left side, lying on diaphragm, 5 cm. in from apex of heart. Marked opacity in rt. lung. Diaphragm higher than normal, with adhesions to lateral chest wall.	—	Com. depôt.
9	—	F.B. 4½ in. from spine at the same level, with a large abscess around it. Oct. 17th, chest opened and abscess drained. Small piece of bone removed from lung. Oct. 28th, patient died of hæmoptysis.	—	Died.
10	—	Shrapnel bullet left chest just opposite heart. No lung changes July 27th, 1917, D. 1.	11	D 1. Com. depôt.
11	—	Injury to rt. clavicle 2 in. from external end, some necrosis occurring. F.B. in lung.	16	D 1. Com. depôt.
12	—	F.B. in chest opposite 1st interspace, close to sternum. 11 cm. from back.	—	D 1. Com. depôt.
13	—	Rifle bullet in lung. Operated on. Died suddenly on 3rd day, apparently from pulmonary thrombosis.	—	Died.
14	18	Several small fragments of shell in right lung. Large hæmothorax, relieved by oxygen replacement.	20	Duty.
15	29	Shows large piece shrapnel intrathoracic, rt. side, level 3rd rib, 7 cm. right of mid. line. Marked infiltration rt. upper lobes and cavity here. *Tubercular bacilli in sputum.*	2	Invalided to Canada.
16	27	Shows small piece shrapnel lying 1·5 cm. internal to 10th rib, mid-axillary line, rt. side. 2 small pieces just external to 9th rib, 2 cm. from vertebral border, lt. side. 1 small piece just internal to 8th rib, 2 cm. from vertebral border, rt. side.	15	Com. depôt.
17	31	Shows shrapnel ball intrathoracic 2 cm. in front of the 6th interspace, just to right of spine; no lung involvement.	9	Light duty.
18	39	Shows shrapnel ball intrathoracic lying 2 cm anterior to 8th interspace near spinal column, lt. side. Multiple fine shrapnel at site of fracture of 8th rib.	15	Invalided to Canada.
19	24	Shows medium-sized piece shrapnel intrathoracic just above diaphragm near apex of heart, about 4 cm. anterior to 10th rib posteriorly. Old fracture 8th and 9th ribs.	15	Permanent base duty.
20	29	Shows large piece shrapnel near diaphragm opposite 10th vertebra, left side.	70	Invalided to Canada.
21	23	Shows large piece and several small pieces shrapnel intrathoracic, left side, posterior, level 6th rib, moves with respiration. Also large and multiple shrapnel intrathoracic rt. side posterior level of 4th rib.	31	Light duty.
22	20	Shows medium sized piece shrapnel between 9th and 10th ribs, 2 cm. to left of spinal column.	33	,,
23	23	Shows F.B. in diaphragm in front of 10th dorsal vertebra, near rt. border, just below heart.	54	,,
24	19	Shows large piece shrapnel just internal to 5th interspace, nipple line, rt. side.	13	Com. depôt.
25	32	Shows shrapnel ball intrathoracic left side, 6 cm. deep, level of 10th intercostal space. 3 cm. from vertebral margin. Fibrosis and opacity here.	13	Invalided to Canada.
26	18	Shows large piece shrapnel intrathoracic left side, 3 cm. from mid-axillary line, level 7th rib posteriorly.	30	,,
27	32	Shows medium-sized piece shrapnel intrathoracic close to articulation of 7th right rib.	42	Canada.
28	—	Shows piece of shrapnel between 5th and 6th ribs on left side, 3 in. from sternum. Developed empyema. Chest opened and drained.	—	Duty.
29	—	Shows F.B. 1 cm. by ¾ cm. lying in rt. chest 2½ in. from spine and 4·3 in. from sternum.	—	,,
30	—	Shows shrapnel ball just inside left lateral chest.	—	,,
31	—	Shows shrapnel at level of angle of scapula. Pleura drained.	—	,,
32	—	Shows small piece shrapnel over 9th rib. Wound enlarged and rt. chest drained. F.B not removed.	12	Invalided to Australia.
33	—	Shows rifle bullet rt. chest at junction of 11th rib and vertebra.	—	Duty.
34	—	Shows F.B. left side behind lower end of sternum.	25	,,
35	—	Empyema developed. Chest opened and drained. X ray shows F B in chest opposite 7th dorsal vertebra.	30	Invalided to Canada.
36	—	Shows bullet in centre of lower half of left chest with fibrosis around it.	11	C 3.
37	—	Shows F.B. ¾ in. × ½ in. right chest 4¼ in. from ant. chest wall. No hæmothorax. Paralysed arm from injury.	15	Canada.
38	—	Shows bit of explosive bullet ¾ in. × ½ in. in right lung behind 3rd rib.	16	Com. depôt.

50	38	Several small pieces of shell in rt. lung, empyema and resection.	18	Invalided to Canada.

Conclusions.

1. Evidence is lacking that small fragments of shell and shrapnel and likewise rifle bullets and shrapnel balls retained in the lung commonly give rise to any serious trouble.

2. The mortality of gunshot wounds of the chest in patients that have survived the early days of their invalidism and been sent to England with retained missiles in the chest is practically nil if these foreign bodies be left alone.

3. Hence, when it has not been considered necessary by the surgeons at the Front to operate immediately, it should not later on be done, unless, indeed, some very definite indication, such as an abscess, exists.

ABNORMAL MEDIAN AND ULNAR NERVE-SUPPLY IN THE HAND.

BY WILFRED HARRIS, M.D. CAMB., F.R.C.P. LOND.,
CAPTAIN, R.A.M.C., T.; NEUROLOGIST, 3RD LONDON GENERAL HOSPITAL.

DURING the last six months I have met with four cases of abnormal nerve-supply to the hand, two of the sensory distribution and two motor. In two cases the first and second dorsal interossei were quite unaffected in severe ulnar nerve lesions from gunshot wounds, indicating their supply to be from the median nerve in these cases, while the other two cases illustrated an abnormally large sensory supply by the ulnar to the inner two and a half fingers instead of the usual one and a half.

In one of these latter, Captain J. A., aged 34, a case of median-nerve injury from a shell wound in the upper arm, in which the brachial artery was also severely injured, there was the usual wasting of the flexors and of the thenar eminence, with reaction of degeneration of these muscles, but the anæsthesia was limited to the palmar surface of the thumb, the index, and the outer half of the middle finger, both on palmar and dorsal aspects, no trace of anæsthesia being present on the inner half of the middle finger, though the injury was sufficiently severe to abolish sensation completely to prick and to firm pressure on the two distal

phalanges of the index and on the palmar surface of the thumb. It is, of course, well known that the ulnar nerve sometimes supplies sensation to the dorsum of the inner *side of* the proximal phalanx of the middle finger, but in the case here described the ulnar supply was much larger, a whole finger more than usual.

The complement to this case I have seen recently in a youth of 22, a private, with a severe injury of the ulnar nerve from a shrapnel wound through the inner side of the upper forearm. There was complete wasting of all the interossei and hypothenar muscles, though the flexor carpi ulnaris had escaped. There was total anæsthesia to pin-prick and even to the hardest squeeze on the whole of the little and ring fingers and inner side of the hand, and dense anæsthesia also to pin-prick and to moderate pressure over the inner half of the middle finger, both on palmar and dorsal aspects, only hard pressure being perceived in some spots, though sensation was quite normal on the outer side of the middle finger (see figure). Indeed, this anæsthesia of the inner half of the middle finger was much more dense than is usually met with over the inner half of the ring finger in total lesions of the ulnar nerve, in which pin-prick is usually perceived at once as pressure over this half of the finger.

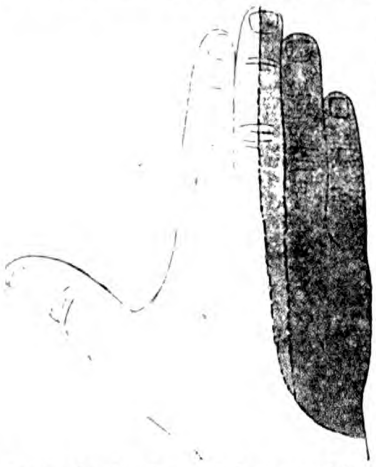

Diagram showing abnormally large area of ulnar anæsthesia on the dorsum of the hand: total to all forms on little and ring fingers and nearly complete, even to pressure, on inner half of middle finger.

Both these cases point to a larger area of ulnar nerve sensory supply at the expense of the median. These two cases are, of course, open to the criticism that in the first case the sensory nerve fibres supplying the third digital cleft may have been uninjured, and that in the second case these particular fibres of the median may have been damaged in addition to the ulnar nerve. That this was most unlikely in the second case is proved by the complete escape of the remainder of the median supply, both sensory and motor, which were normal to all tests. Moreover, the probability of the sensory supply of these two nerves being abnormal in these two cases is increased considerably by the fact that I have been able to prove in another case by operation that total division of the ulnar nerve in no way affected the first or second dorsal interossei muscles, thus showing incontestably an abnormally small motor distribution of the ulnar nerve in the hand.

In two patients I have seen complete escape of the first and second dorsal interossei in severe lesions of the ulnar nerve, the third and fourth dorsal interossei being paralysed with the hypothenar muscles and showing complete reaction of degeneration to electrical testing. The sensory paralysis in these two cases was of the usual distribution.

In one of them, Private N., an Australian, aged 23, the nerve was operated upon and found to be very much damaged, one inch of the nerve being then excised and the nerve sutured. When I was able to examine him again 11 days later there was still perfect voluntary movement of the first and second dorsal interossei, as he could abduct easily the index and middle fingers, though he could not move the middle finger towards the ring finger beyond the middle line. There was no sign of wasting of the two outer dorsal interossei, and both reacted briskly to faradism, just as they did before the operation upon the nerve.

Oppenheimer[1] mentions a case of ulnar paralysis in which all the interossei and lumbricals escaped, and Goldmann[2] describes a case of section of the ulnar nerve in which there was no motor disorder whatever. I have, however, met with no record of a case in which the dorsal interossei, like the lumbricals, were divided equally between the median and ulnar nerves, and I have therefore thought it advisable to record these cases.

CEREBRO-SPINAL FEVER: THE MODE OF INVASION BY THE MENINGOCOCCUS.

BY C. WORSTER-DROUGHT, M.B. CAMB.,
TEMP. CAPTAIN, R.A.M.C.; OFFICER IN CHARGE CEREBRO-SPINAL FEVER WARDS, ETC., ROYAL HERBERT HOSPITAL;
AND
ALEX. MILLS KENNEDY, M.D. GLASG.,
TEMP. CAPTAIN, R.A.M.C.; BACTERIOLOGIST, ROYAL HERBERT HOSPITAL.

IT is now generally accepted that the naso-pharynx is the portal of entry of the meningococcus in cases of cerebro-spinal fever. There is still, however, much difference of opinion as regards the exact mode of invasion of the meninges from this primary situation.

The possible routes of entry to the meninges are as follows:—1. Direct extension, *via* (*a*) middle ear; (*b*) sphenoidal sinus; (*c*) trans-ethmoidal route. 2. Indirect route, *via* the blood stream.

Direct Extension.

(*a*) *Middle ear.*—Infection occurring from the naso-pharynx by spreading down the Eustachian tube to the middle ear, and thence along the pia-arachnoidal sheath of the auditory nerve, has been suggested; this view, however, has no evidence in its support. Acute otitis media is most infrequent in cerebro-spinal fever, and, in the rare cases in which it does occur, always appears late in the disease. Recent otitis media was not present in upwards of 100 cases under our care, although four had chronic otitis media of very old standing.

(*b*) *Sphenoidal sinus.*—Investigations by Westenhoffer,[1] von Lingelsheim,[2] and E. Meyer suggested that infection might occur by direct extension from the naso-pharynx to the sphenoidal sinus; from here suppuration would readily extend through the thin lamina of bone above the sinus. Westenhoffer found that in 29 autopsies 34 per cent. showed some inflammation of the sphenoidal sinus; additional support for this hypothesis was thought to be forthcoming by the fact that in cases that died early in the disease the exudate was found localised in the base of the region of the hypophysis. A similar localisation, however, is observed in practically all forms of early meningitis—e.g., tuberculous meningitis and that secondary to middle-ear disease, &c. Flexner also showed that there was an identical localisation in the experimental meningitis induced in monkeys by the intra-spinal injection of meningococcus culture.

Westenhoffer's later observations led him to abandon his former view, as further researches failed to demonstrate the meningococcus in the sphenoid bone itself and showed that the exudate was confined to the superior and lateral aspects of the bone. Direct extension *via* the sphenoidal sinus has, more recently, again been advocated by Embleton and Peters,[3] who met with five cases of cerebro-spinal fever in which, on post-mortem examination, the sphenoidal mucous membrane was found injected and the sinus cavity filled with pus, together with osteitis of the surrounding bone. In two cases meningococci were demonstrated in the pus cells contained both in the sphenoidal sinus and the bone and in one the cancellous tissue also; the organism was not found in the other three. These authors also mention a recrudescent case of cerebro-spinal fever in which the sphenoidal sinus was opened from the nose, a drachm of pus escaping, which on examination was found to contain meningococci.

Although such direct infection by the meningococcus may possibly occur in very rare instances, just as in pneumococcal or streptococcal meningitis secondary to foci in the nasal fossæ, it is certainly not the usual mode of meningeal infection in cerebro-spinal fever. Further, in view of Westenhoffer's later observations, one has to bear in mind the possibility of such sphenoidal conditions being secondary to the meningitis rather than occupying a causal relationship to it. In 25 autopsies we found no evidence to support this view of infection *via* the sphenoidal sinus.

(*c*) *Trans-ethmoidal route.*—By experimental injections of methylene blue and Chinese ink in the dog and rabbit, André[4] demonstrated downward prolongations of the sub-arachnoid space, which form a network round the olfactory filaments as they pass through the cribriform plate. Other prolongations also pass, though quite independently of the

olfactory nerves, and, further, after injection, the mucous membrane of the nose was coloured as far downwards as the level of the superior turbinate bone. He concluded, therefore, that by means of these prolongations a direct communication exists between the subarachnoid space and the lymphatics of the upper portion of the nose. The direction of the current, however, demonstrated by these injections is from the subarachnoid space to the nasal lymphatics; meningococci similarly injected in monkeys found their way into the naso-pharynx.

As a result of the above observations, Netter and Debré [5] favoured the view that in cases of cerebro-spinal fever direct infection occurred from the naso-pharynx through the subarachnoid prolongations. It was necessary, however, to imagine, in cerebro-spinal fever, a reversal of the direction of the current—that is, from the naso-pharynx to the subarachnoid space, instead of *vice versa*. Of this no definite proof exists, experimental or pathological; infection of the meninges in monkeys has not been provoked by inoculation of meningococci into the naso-pharynx, although it is not without interest in this connexion to note that Flexner produced poliomyelitis in monkeys by the intra-nasal injection of the virus. Westenhoffer in his fatal cases found no evidence of extension along the lymphatics about the carotid artery nor along the nerve sheaths.

This view, therefore, although not without attraction, is somewhat conjectural and lacks proof; clinical observations, moreover, as we shall mention later, do not lend it much support.

Infection via *the Blood Stream.*

According to this view the meningococcus is absorbed from the naso-pharynx and carried by the blood to its site of election—the pia-arachnoid. The fact of obtaining cultures of meningococci from the blood of cerebro-spinal fever patients, once definite meningeal inflammation has begun, is not, of course, evidence that infection has taken place *via* the blood stream; such coccæmia might well have developed secondarily to the meningitis by the escape of the organisms into the circulation from the pia-arachnoid space, as occurs at the height of meningitis induced in monkeys by the intrathecal injection of meningococci. A similar possibility applies to the indirect evidence of the presence of cocci in the blood stream, afforded by the appearance of lesions distant from the central nervous system—e.g., arthropathies.

The most significant evidence lies in the occurrence of cases of cerebro-spinal fever in which the meningococcus can be isolated from the blood at a time prior to the invasion of the meninges, when meningitis can be proved, by examination of the cerebro-spinal fluid, to be non-existent. It would appear that, in the vast majority of cases, the meningococcus on reaching the blood stream from the naso-pharynx is quickly carried to the meninges (in from a few to 48 hours), constituting at this stage a coccæmia or temporary presence of meningococci in the circulation, whilst being carried to their destination, rather than a definite septicæmia in which the organisms are multiplying in the blood stream. Some recent experiments by Cresswell Shearer and Warren Crowe [6] suggest that conveyance of the meningococcus from the naso-pharynx to the meninges may be performed by the leucocytes. These observers, using freshly drawn spinal fluid from cerebro-spinal fever patients, in which the leucocytes had been shown to be alive by trypan-blue staining and observation on the warm stage, obtained good evidence that the meningococci could be taken up by human leucocytes in large numbers and retained by them for some considerable time without undergoing digestion; they could be recovered from these leucocytes up to 48 and even 60 hours afterwards.

It is true that experimental blood inoculation in animals has failed to produce meningitis, but the explanation of this failure may lie in the fact that all laboratory animals, as regards specific lesions, are relatively insusceptible to the meningococcus; in monkeys even, Flexner had to inject meningococci directly into the subarachnoid space in order to induce meningitis.

In some cases of cerebro-spinal fever the organism may infect the blood, causing a true septicæmia, and in rare instances remain confined to the blood stream for a considerable time before the meninges become involved. If the meningococcus were not primarily absorbed into the circulation it is difficult to understand how this could possibly occur. The following case, which recently came under our care, illustrates the meningococcus definitely established in the blood stream prior to infecting the meninges.

Meningococcal Septicæmia preceding the Meningitis.

CASE 1.—The patient, a man aged 26, was admitted to hospital in a collapsed state. He had felt quite well during the previous day, but in the evening complained of headache. That night he slept very little, and next morning had several shivering attacks vomiting about mid-day. On admission to hospital during the afternoon he was very pale; the temperature was 103·8° F. and the pulse feeble, the rate being 120 per minute. Beyond this there were no physical signs.

Early next morning the patient was seen to be more collapsed and a *hæmorrhagic rash*, consisting of many petechiæ and several large purpuric spots and even patches (vibices), was found to have appeared. The vibices were most numerous on and around the hips, but were also present on the arms and legs (extensor aspects), abdomen, and a few on the face. The temperature was subnormal (96·8°) and the pulse too feeble to count. His mental condition was normal, the sphincters were unaffected, the neck was perfectly supple, and Kernig's sign was definitely negative. He had now ceased to complain of headache. Lumbar puncture revealed a perfectly clear cerebro-spinal fluid; no increase was found in the cellular constituents and no organisms either on direct examination of the centrifugalised deposit or in culture. His appearance strongly suggested that of a fulminating case of cerebro-spinal fever, in spite of the normal consciousness and complete absence of all signs of meningitis. Consequently 30 c.c. of antimeningococcic serum were given intramuscularly and, to keep the blood pressure as high as possible, rectal saline (six-hourly) and digitalin (gr. 1/100, four-hourly) were also administered.

A blood culture taken at this time yielded a Gram-negative diplococcus, showing the cultural and fermentative characteristics of the meningococcus and, further, agglutinating by Gordon's type 2 univalent serum. A leucocyte count, performed the same morning, showed 38,400 white cells per c.mm. of blood. Blood films, taken from the ear and from a purpuric patch, did not show any characteristic diplococci. Naso pharyngeal swab yielded a meningococcus agglutinated by the same serum as that from the blood (type 2, Gordon).

Meningitis.—By the evening of the same day the patient's general condition had somewhat improved; the pulse was stronger, the rate now being 88 per minute, and the temperature had risen to normal. There was now some slight rigidity of the posterior cervical muscles, and Kernig's sign appeared just positive; the mental condition and sphincters, however, remained normal. Lumbar puncture now yielded 45 c.c. of slightly turbid fluid, which on microscopical examination showed polymorphonuclear cells and a moderate number of lymphocytes; several pairs of Gram-negative diplococci were also present, both intra- and extra-cellularly. He was given 30 c.c. of antimeningococcic serum intrathecally.

On the following day the patient's general condition had still further improved, although neck rigidity and Kernig's sign were more marked. The cerebro-spinal fluid, though still remaining turbid and with the same cytological characteristics, showed no Gram-negative diplococci. The leucocytes had fallen to 24,000 per c.mm. Serum was administered intrathecally daily until the fifth day of illness, lumbar puncture being continued until the sixth day, when the cerebro-spinal fluid was quite clear and showed no abnormal increase in the number of cells.

It would appear that the above case, in the usual course of events, should have been of a "fulminating" type, but the patient came under observation very early in the disease and, also, the septicæmic stage was somewhat prolonged, thus enabling therapeutic measures to be taken prior to the involvement of the meninges. From the preceding remarks, it follows that fulminating types probably result from a severe blood infection. Blood cultures, therefore, should be positive, and this is often found to be the case. Some observers, indeed, have seen Gram-negative diplococci in blood-films from patients exhibiting a purpuric eruption. A. C. Coles [7] figures such films taken from the ear of a patient with a purpuric rash who died within 50 hours of the onset of the disease. In these cases the meningitis, as shown by post-mortem examination, is often comparatively slight.

Other examples of meningococcal infection occasionally occur in which the meningococcus remains confined to the blood stream and never settles in the meninges. Such cases are admittedly rare.

In 1906 Andrewes reported a case with a purpuric eruption which yielded meningococci upon blood culture. The patient died in a few days without developing meningitis, evidence of which was also absent at the post-mortem examination. More recently Pybus [8] has recorded the case of a girl, aged 3 years, exhibiting petechiæ and some small hæmorrhagic patches on the lower extremities, who died within 12 hours of an acute onset. Post-mortem cultures made from the heart blood yielded a pure growth of meningococci, but the brain and spinal cord presented no sign of meningitis.

It is possible, of course, that if the above patients had not succumbed to the intensity of the blood infection, the meninges might have become involved later. In a few septicæmic cases, however, structures other than the meninges may be involved, as, for instance, the endocardium.

The following case of meningococcal septicæmia with ulcerative endocarditis recently under our observation ran a

course of over six weeks' duration. No physical signs of *meningeal* infection were present at any stage of the disease, and also at the autopsy meningitis was found to be absent.

Meningococcal Septicæmia with Ulcerative Endocarditis.

CASE 2.—The patient, a man, aged 37, was received into hospital, the temperature being 104° F., with a provisional diagnosis of influenza. He was said to have had "rheumatic fever" when young, but to his knowledge had had no other illnesses. On admission, no definite physical signs were apparent, and after five days the temperature fell to normal, the patient being allowed up a day or two later. The pulse-rate at this time varied between 84 and 90 per minute; during the pyrexial period it had averaged 106. When he had been up about six days the patient was suddenly seized with rigors; the temperature rose to 100°, and from this time he complained of dyspnœa and frequent palpitation.

General course.—The pyrexia occupied six days before reaching its maximum (103·4°), having gradually risen from 100° by successively increasing evening rises, the morning remissions being 1–2° lower. From this point onwards the pyrexia was rather of a continued type, varying between 100° and 103·4° during the second week, but not falling below 101°, excepting on one occasion, during the course of the third, fourth, and fifth weeks; the morning temperature was usually about 1° lower than that in the evening. Throughout these periods, the patient complained of more or less constant dyspnœa, occasionally showing exacerbations in its severity. During the fourth and fifth weeks he was somewhat cyanosed, and the tongue was dry and tremulous. Towards the end of the sixth week his condition became increasingly grave and œdema of the lower extremities made its appearance. The temperature began to fall and did not rise above 99·4° during the four days preceding his death, which occurred after a course of six and a half weeks.

No rash or petechiæ ever appeared, nor was there any evidence of meningitis; both neck rigidity and Kernig's sign were absent throughout, and the mental condition, excepting when he sank into unconsciousness before death, was invariably normal.

Circulatory system.—Heart: During the first three weeks of the illness a "to-and-fro" murmur could be heard at the base of the heart in the aortic region, together with a very faint systolic murmur at the apex. The heart became moderately enlarged, the apex beat reaching just outside the nipple line in the fifth interspace. By the end of the fifth week, however, the enlargement was considerable; the apex extended in the sixth interspace fully 1½ inches beyond the nipple line. In the aortic area there was a marked double murmur, which varied in intensity from time to time; the apical systolic murmur also became more pronounced. During the last week of the course the cardiac sounds were indistinct and the murmurs occasionally inaudible.

Pulse: The pulse-rate did not reach above 90 per minute during the first week; up till the end of the third week its highest recorded rate was 104, the average for this period being about 100. Thereafter, however, it seldom fell below 112, and was frequently 136 especially during the fifth week. With the decline of the pyrexia, the pulse-rate also showed a tendency to fall, rising again, nevertheless, towards death.

Blood: A count of the white blood cells, midway through the second week, showed only 6200 per c.mm. At the same time the patient's serum failed to agglutinate paratyphoid A. B, or typhoid bacilli; a Wassermann reaction also was negative. Blood culture (10 c.c. of blood in both), however, yielded a Gram-negative diplococcus, showing the cultural characteristics and fermentative reactions of the meningococcus; it fermented glucose and maltose, but not saccharose. The organism, moreover, gave a positive agglutination reaction with Gordon's Type 2 univalent meningococcal serum, but not with that of the other three types.

Early in the fourth week the leucocytes had increased to 39,400 per c.mm. and, to confirm the previous findings, another blood culture was taken with the same result as before—the isolation of a Type 2 meningococcus.

Other viscera: At the beginning of the fourth week the spleen appeared to be tender, but although enlarged to percussion during the fifth week its edge was never definitely palpable. The liver was found to be enlarged as early as the third week, the lower edge extending about 1–1½ in. below the costal margin. The lungs always appeared clear, but a scanty mucoid expectoration occurred throughout. The urine, whenever examined, contained a trace of albumin.

Autopsy.—Brain: Pale and anæmic, but otherwise normal. No meningitis.

Heart: The heart was large and soft, being 18½ oz. in weight. The tissue muscle generally, and particularly that of the ventricles, showed well-marked myocarditis (musculature mottled, small pale areas alternating with congested areas, and the muscle fibres showing a tendency to fall apart). The acute and widespread nature of the myocarditis was confirmed later on microscopical examination of prepared sections. On the surface of the heart there was considerable thickening of the epicardium ("milk-spots"), covering the greater part of the posterior aspect of the right ventricle, the whole of the right auricle, and on the left ventricle, chiefly following the course of the vessels. The right auricle and all the ventricles were markedly dilated, but the capacity of the left cavity was only slightly increased; both the right auricle and the right ventricle showed considerable hypertrophy, and the left ventricle to a moderate amount. The coronary arteries, pulmonary artery and valves appeared normal; the tricuspid valve was healthy, but the orifice slightly dilated. The mitral orifice was also dilated, admitting the fingers, while the valves were free and normal, excepting at the same base of the anterior cusp, the appearance of which is described below.

The **aortic valve** showed ulcerative endocarditis affecting the left anterior cusp only, the other cusps appearing normal. A portion of the left half only of the left posterior cusp was involved; the free edge was quite unaffected, but below this, between the edge and the base, was a large perforation, more or less circular in shape, and about ⅜ inch in diameter. The lower edge of the opening reached to the base of the cusp, the margins were ulcerated, and projecting from it into the ventricle was a massive fibrinous and fairly tough vegetation; its under structure was about ¼ inch thick and projected a distance of ½ inch from the cusp. Sections prepared from this vegetation, including the piece of aortic cusp to which it was attached, showed large numbers of cocci having the morphological appearance and staining reactions of the meningococcus. Other vegetations apparent at the edge of the perforation encroached to a slight extent on the base of the anterior mitral cusp where it and the aortic cusp meet.

Aorta: A small circular aneurysm, ¼ inch in diameter, was seen immediately above the perforation in the cusp; it perforated the inner and middle layers of the aorta, its base being formed by the external coat. A few fatty streaks were found in the tunica intima, but no atheroma or evidence of syphilis.

Lungs: The right lung showed old pleural adhesions of the outer and posterior surfaces of the upper lobe and also of the posterior surface of the lower lobe in its upper portion. There were no adhesions on the left side nor to the diaphragm. A certain amount of chronic bronchitis and emphysema was also apparent.

Liver: Much enlarged, the weight being 90½ ounces; there was nothing visible to the naked eye.

Spleen: Also enlarged (weight 18 ounces); it showed old adhesions: the pulp was soft and friable, and a few recent infarcts were present.

Kidneys: Both enlarged generally, but no other apparent change.

R. L. Cecil and W. B. Soper,[10] in 1911, reported a somewhat similar case of primary meningococcal endocarditis, proved by blood culture and autopsy, who died on the tenth day of illness without developing meningitis. Some doubt has been thrown upon Cecil and Soper's case by later writers on the ground of the difficulty in distinguishing the meningococcus from the gonococcus in blood cultures. We consider, however, that the case described above confirms their report.

Further evidence of infection *via* the blood stream is afforded by clinical observations gained by a study of the onset of the disease in different cases. The onset, although sometimes preceded by a variable period of slight malaise, is usually somewhat sudden, in contrast, as pointed out by Elser and Huntoon, to that form of meningitis secondary to otitis media, in which infection of the meninges occurs by direct extension. In the majority of cases of cerebro-spinal fever initial rigors are present, frequent chills, and, finally, vomiting. Cases coming under observation at this stage may reveal a perfectly clear cerebro-spinal fluid, showing no increase in the cellular constituents and devoid even of diplococci.

Dopter originally conceived cerebro-spinal fever as a disease falling into three definite stages: (1) catarrhal; (2) septicæmic; and (3) meningeal. This view was also, in 1915, advocated by Lundie, Thomas, and Fleming[11] in England, and later by Fairley and Stewart[12] in Australia. They regarded the catarrhal stage as the most prevalent form of the disease, the meningeal stage being reached in a comparatively small percentage of cases. As Horder[13] remarks, this view comprises the whole series of pathogenic events open to the meningococcus rather than connotes the disease process to which it more often gives rise. In man, for whom the meningococcus is definitely pathogenic, there is overwhelming evidence that the meninges are preeminently the site of election for this organism.

Lundie, Thomas, and Fleming categorically stated that all their carriers had naso-pharyngeal catarrh, but the fact of such catarrh being present in all carriers has not been borne out by other observers. The greater number of carriers that we have dealt with during the past two years have shown no naso-pharyngeal catarrh, and in the remainder evidence that it was due to the meningococcus was very indefinite. In some, indeed, it may be accounted for by the presence of adenoids, which, as Foster and Gaskell[14] point out, is by no means an uncommon concomitant of the carrier state.

Westenhoffer and von Lingelsheim considered that a meningococcal pharyngitis occurred before the supervention of meningitis. It is true that some cases show a varying degree of pharyngitis or other catarrhal condition; a fair percentage, also, complain of catarrhal symptoms, such as "sore throat," "cold" or cough, preceding the onset of cerebro-spinal fever. Many cases, however, have no catarrh. Nevertheless, it is probable that naso-pharyngitis and other catarrhal conditions predispose to the entry of the meningococcus rather than result from its presence in the respiratory tract. The occurrence of cerebro-spinal fever during convalescence from such catarrhal states as influenza and measles further supports this view.

It was possible to obtain a detailed history of the onset in 62 of our cases; in 25 (40 per cent.) the attack of cerebro-spinal fever was immediately preceded by some catarrhal condition. It consisted of a complaint of "sore throat" in 11 patients of the 25; in five of these the "sore throat" was accompanied by a "cold" and in three a cough. The duration of such symptoms was from 3 to 12 days. 12 patients complained of a "cold" prior to the onset of cerebro-spinal fever, the period varying from three days to

three weeks, and, finally, a cough had been present in two patients for three weeks preceding the illness. One patient developed cerebro-spinal fever within four days of his recovery from a mild attack of influenza and another during convalescence from measles.

Conclusions.

1. The mode of entry of the meningococcus is *via* the blood stream.

2. In the ordinary type of case the coccus is carried to the meninges by the blood within a few hours without definitely infecting the blood itself.

3. In some cases, however, blood infection (septicæmia) occurs—e.g., in fulminating cases prior to the involvement of the meninges; the septicæmia then frequently overshadows the meningitis.

4. In rare cases the organism may remain infecting the blood alone for a considerable time, before finally reaching the meninges, or the patient may die of such septicæmia before meningitis can occur.

5. In other instances the meningococcus infecting the blood may also invade structures other than the meninges—e.g., the cardiac valves.

6. Catarrhal conditions predispose to meningococcal infection, but the meningococcus does not necessarily produce naso-pharyngeal catarrh.

ON THE ACTION OF SPINAL FLUID IN STIMULATING THE GROWTH OF THE MENINGOCOCCUS.

BY CRESSWELL SHEARER, M.D., F.R.S.,
MILITARY HOSPITAL, DEVONPORT.

IN a former paper[1] I have shown that the growth of the meningococcus on an artificial culture medium is considerably increased in the presence of an aqueous or an alcoholic extract of dilute nasal secretion, this secretion, like blood, acting as an accessory food-body in stimulating bacterial growth. The power which the meningococcus possesses of invading the cavities and membranes of the brain and spinal cord renders it important to determine if brain tissue extracts or normal human spinal fluid exercise any similar action on the growth of this germ.

The following experiments have been devised with the object of testing this point. The ones dealing with the action of spinal fluid have been repeated many times.

EXPERIMENT 1.—*To determine the action of small pieces of brain tissue and spinal cord membranes in stimulating the growth of the meningococcus when added in a sterile and thoroughly washed condition to various media.*—(*a*) To the surface of a culture plate of sterile silica jelly a thin emulsion of human spinal cord and brain membranes was applied. This was prepared by washing the tissues first thoroughly in running distilled water and then grinding them up with sand and sterilising. No growth of the meningococcus could be obtained on these plates.

(*b*) The experiment was varied by adding the emulsion to a 2 per cent. agar solution, mixing, and rendering neutral to litmus paper and sloping it in test-tubes. No growth could be obtained on these tubes using freshly isolated strains of the meningococcus. Growth, however, took place when old laboratory strains were used.

(*c*) Small fragments of similarly prepared brain tissue and membranes were added to agar slopes and sterilised. No growth took place on these tubes when they were inoculated with freshly isolated strains of the meningococcus.

The conclusion drawn from these experiments is that if human spinal cord tissue, brain membranes or tissue are thoroughly washed to remove all traces of blood and serum, then these tissues in themselves possess no particular power of stimulating the growth of the meningococcus. The experiments as carried out as described above are inconclusive, as it is difficult to accurately adjust the reaction of these media.

EXPERIMENT 2.—*To determine the action of sterile human spinal fluid in stimulating the growth of the meningococcus when added in different proportions to various standard culture media.*—(*a*) To the surface of a culture dish of Crowe's chocolate medium, 25 c.mm. of an emulsion (of 4 million cocci to the c.c.) of a freshly isolated meningococcus strain in sterile human spinal fluid was added. A control emulsion of the same strain was made up of the same strength in sterile Ringer's solution. The growth on the plate containing the spinal fluid emulsion was many times greater than that obtained on the plate inoculated with the Ringer's solution after 48 hours' incubation at 37° C.

(*b*) To 10 c.c. of a 2 per cent. solution of agar in Cole and Onslow's[2] amino-acid broth 2 c.c. of sterile human spinal fluid was added, while to a control tube 10 c.c. of the same agar solution without the spinal fluid was made up. Both tubes were then inoculated with a similar quantity of a freshly isolated meningococcus strain. A large and thick growth took place on that tube which had received the spinal fluid, while little or no growth took place on the tube without it.

(*c*) To a tube of 10 c.c. legumen trypagar 2 c.c. of sterile human spinal fluid was added and the tube inoculated with a freshly isolated strain of the meningococcus. A control tube without spinal fluid was inoculated with a similar quantity of the same culture. A large amount of growth was obtained after 24 hours' incubation at 37° C. on the tube which had received the spinal fluid, while no growth had taken place on the tube without it.

The conclusion drawn from these experiments was that the growth of the meningococcus is greatly increased on various solid media in the presence of normal sterile human spinal fluid as compared with the growth of the same strains of the germ grown on these media in its absence.

EXPERIMENT 3.—*To determine the action of spinal fluid in stimulating the growth of the meningococcus, as compared with the action of fresh sterile blood and an aqueous extract of nasal secretion and an alcoholic extract of the same.*—To tubes A, B, C, D, and E 10 c.c. of Cole and Onslow's amino-acid broth was added. To tube B ten drops of normal sterile human spinal fluid was added. To tube C ten drops of sterile aqueous extract of nasal secretion was added. To tube D ten drops of a sterile alcoholic extract of nasal secretion was added. To tube E three drops of freshly drawn human blood was added. All the tubes were then sterilised for two hours in the steam steriliser. To each of the tubes was then added three drops of an (200 million cocci to the c.c.) emulsion of a freshly isolated strain of the meningococcus, a 24-hour culture being employed. The tubes were then incubated at 37° C. for 24 hours.

Result: A, no growth; B, large growth; C, small growth, D, little or no growth; E, large growth.

The conclusion drawn from this experiment was that both sterile human spinal fluid and blood increase the growth of the meningococcus in amino-acid broth, while this broth is alone unable to grow a freshly isolated strain of this germ. Spinal fluid in these experiments brought about a larger amount of growth in amino-acid broth than the same quantity of blood. An aqueous extract of nasal secretion produced slight growth, while an alcoholic extract brought about hardly any growth of the meningococcus in amino-acid broth.

EXPERIMENT 4.—*This experiment was in large part a repetition of the last one, the amino-acid broth in this instance being added to 10 c.c. plain agar and sterilised.*—Into three tubes, A, B, C, 10 c.c. of plain 2 per cent. agar solution was placed. In addition into tube A 2 c.c. Cole and Onslow's strong amino-acid broth was added. Into tube B 2 c.c. of boiled human spinal fluid was added in addition to 2 c.c. of amino-acid broth. Into tube C 2 c.c. of an aqueous extract of nasal secretion was added in addition to 2 c.c. amino-acid broth. The tubes were then sterilised by autoclaving for ten minutes at 120° C. They were then poured into sterile Petri dishes and allowed to set. To the surface of each dish 1 c.c. of an (200 million to the c.c.) emulsion of a 24-hour culture of a recently isolated meningococcus strain was added and spread over the surface. The plates were incubated for 24 hours at 37° C. No growth took place on plates A and C, but a thick growth appeared on plate D, this being the plate that had received the spinal fluid.

[1] THE LANCET, 1917, i., 59.

[2] Cole and Onslow: THE LANCET, 1916, ii., 9.

The conclusion drawn from this experiment is similar to that of the last in its main result; spinal fluid brings about a much larger growth of the meningococcus when it is present in a culture medium of agar and amino-acid broth than does nasal secretion extract.

General summary of the foregoing experiments.—The main outcome of the foregoing experiments is to show that there is present in normal spinal fluid some substance that greatly increases the rate of growth of the meningococcus on an artificial culture medium. They clearly demonstrate that this power, in the case of human spinal fluid, is relatively greater than that shown by blood or nasal secretion; that volume for volume spinal fluid brings about a much thicker growth of the meningococcus than do the same volumes of blood or nasal secretion.

In a recent paper Miss Jordan Lloyd[3] has drawn attention to the presence in widely different bodies as blood, serum, milk, and other animal and probably vegetable tissues, of certain accessory food factors which materially affect the rate of growth of the meningococcus on various media. It was to be expected therefore that a similar property would be possessed by the spinal fluid. The interest of the above experiments, however, lies not so much in the possession of this property, as in the fact that it is possessed in a relatively greater degree than either blood or nasal secretion, and that this fact may be of some importance in explaining the quick growth of the meningococcus in the cerebro-spinal fluid and its power of rapidly invading the membranes and cavities of the central nervous system.

In a recent paper I have shown[4] (in conjunction with Crowe) that human leucocytes are capable of taking up living meningococci and keeping them alive for considerable periods of time. We suggested that this might be the means by which this organism gains admission to the cerebro-spinal fluid and the meninges. In the light of the above experiments the rapid growth of the cocci would be ensured by the spinal fluid, once the organism had been introduced into it by the leucocytes. The present experiments with spinal fluid therefore afford some additional support of our original experiments as to the mode of infection in cerebro-spinal fever.

Clinical Notes:

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

REMOVAL OF SHRAPNEL FROM THE SUBCLAVIAN ARTERY.

By H. C. DONALD, M.B., C.M.GLASG., F.R.C.S. EDIN.,
MAJOR, R.A.M.C. (T.F.)

THE interesting features of this case are: 1. The emergency of the operation. 2. The difficulties experienced on account of the depth of the vessel at the high seat of ligature whilst at the same time the hole in the artery had to be plugged by the finger of the left hand of the operator to control the alarming hæmorrhage. 3. The ball-valve action of the fragment of shrapnel in the artery, which undoubtedly saved the patient's life.

No. P/822, Private H. S., 10th Prussian Infantry, prisoner of war, was admitted to hospital on April 26th, 1917, in a collapsed and blanched condition, with signs of severe hæmorrhage from a punctured wound about half an inch below and towards the centre of the right clavicle. The hæmorrhage had, however, ceased for the time being. The patient was treated on general lines and improved. There was also musculo-spiral paralysis of the right arm, fairly well marked, with drop-wrist. On the evening of the second day after admission a second and severe hæmorrhage occurred, and simultaneously a soft swelling developed under the clavicle. The patient was removed to the operating hut absolutely collapsed, pallid, with no pulse felt at right radial, and only a very feeble and rapid pulse at left.

Intravenous saline infusion was attempted while patient was being anæsthetised, but owing to the collapsed condition of the veins was impracticable, so subcutaneous was commenced. However, during the progress of the operation a vein was struck, and intravenous infusion was continued throughout. An incision was made parallel to, and half an inch below, the clavicle, and both pectorals were divided. A large blood clot, the size of a duck egg, was found. As this was cleared away an alarming fountain of blood burst forth. A finger was plunged deep into the wound which controlled the bleeding. It was found that there was a hole in the subclavian artery at about the juncture of the second and third part of the vessel. A piece of shrapnel about the size of a small haricot bean was felt inside of the artery and partially blocking the opening.

The course of the vessel was exposed under difficulty, as one hand was fully occupied in controlling the hæmorrhage, and a ligature was placed round the subclavian as high up as possible about the beginning of the second part. The piece of shrapnel was removed and the tear in the vessel clearly demonstrated. The pectorals were repaired and the wound stitched except at the outer end, which was drained.

The patient's condition was very grave, and remained so during the night. Saline infusion was kept up at intervals for the next 24 hours. With the exception of slight superficial suppuration of the wound the patient's recovery was rapid and uninterrupted. On the fifth day after the operation the radial pulse was perceptible and gradually increased in volume, and the musculo-spiral paralysis showed signs of improvement later.

The number of days from the time this man was wounded to the day of operation is not known, but as he was operated on at the base, where he arrived as a sitting case, it is probable that many days elapsed.

I am indebted to Lieutenant E. Wragg, R.A.M.C., for his assistance at the operation and for his care in the after-treatment of the case.

A CASE OF COMPLETE OBLITERATION OF THE ULNAR ARTERY BY SUPPURATION.

By JEHAN M. BARLET, M.D.,
MEDICAL OFFICER IN CHARGE, FRENCH HOSPITAL; AIDE MAJOR, ARMÉE FRANÇAISE.

THIS case is recorded to show the complete disappearance of the ulnar artery for a distance of 8 inches due to suppuration. The patient made a perfect recovery and has the use of his arm, which he can use to manipulate his crutches.

The patient, aged 24, was admitted to the French Hospital on April 30th, 1917, having been wounded six days before; he was suffering from a seemingly superficial flesh wound of the left forearm. He had also had his left femur amputated in the lower third. On admission his temperature was 101° F. and pulse 110.

On May 9th he had considerable swelling of the forearm, which was opened up and pus found in the deep layer of muscles; drainage-tubes were put in reaching from elbow to wrist. At midnight he had an attack of secondary hæmorrhage when the tubes were removed by the house surgeon. This was followed by two more attacks of secondary hæmorrhage at midday and 7 P.M., which were controlled by a tourniquet. At 9 P.M. on the 10th he had a further hæmorrhage, whereupon I had an anæsthetic administered and cut down upon the brachial artery, which was bleeding at the bend of the elbow, but being unable to tie it off a pair of Spencer Wells forceps was left on.

Two days afterwards it was decided to cut down and tie the ulnar artery, but upon opening up the forearm under $CHCl_3$ it was found that the ulnar artery for the greater part of its length had been destroyed by ulceration, and only the two ends were left, so ligatures were applied—one just below the bifurcation of the brachial artery and the other at the level of the pisiform bone. The arm was treated throughout by means of the Mencière solution.

I am indebted to Mr. W. H. Clayton-Greene, senior surgeon of the French Hospital, for permission to publish this case.

Bedford Court Mansions, W.C.

ROYAL VICTORIA HOSPITAL, BELFAST.—The clinical winter session at the Royal Victoria Hospital was opened with an address by Dr. W. Calwell, in which he referred to the fact that five of the full staff of the hospital were at the front, and that all the auxiliary staff were or have been serving. Including former and present members of the medical school, the following honours had been won: 1 V.C., 2 C.B.'s, 3 C.M.G.'s, 1 C.I.E., 4 D.S.O.'s, and 15 M.C.'s, while 21 persons were mentioned in despatches. In conveying a vote of thanks to Dr. Calwell, Sir John Byers, who presided, incidentally referred to the brilliant work done by an old student of the school, Major Robert McCarrison, as show in his book, "The Thyroid Gland in Health and Disease."

SECTION OF ANÆSTHETICS.

Anæsthetics in Home Military Hospitals.

A MEETING of this section was held on Nov. 2nd, Mr. GEORGE ROWELL, the President, being in the chair.

Lieutenant-Colonel J. F. W. SILK, R.A.M.C., opened a discussion on Anæsthetics in Home Military Hospitals. He said that chloroform, pure and undiluted, was to be avoided when possible. The mortality was high even with skilled anæsthetists when using chloroform. He thought it was of value in many cases, especially when given diluted with ether and by the open method. For *short cases* three methods of anæsthesia were suitable: (1) local anæsthetics, perhaps not used as often as might have been expected before the war; (2) N_2O; and (3) ether, which should be given preferably by the open method. He thought that the preliminary injection of morphia and atropine should be almost a routine. Sometimes hyoscine was added to the mixture. If ether was to be administered atropine should always be given as it dries up the mucous secretion. As to the time of the injection he thought the orthodox hour before the operation was too much. He would give it half or even a quarter of an hour before, for choice, and it should be given in the anæsthetic room rather than not at all. He advised morphia ¼ gr., and atropine 1/100 gr. For the mask he preferred gauze to lint. When time was no object he thought ether should be used from the beginning, otherwise it was best to begin with a mixture of chloroform and ether. To hasten induction he often began with ethyl chloride dropped on an open mask, or used ether in a Clover. He liked McCardie's drop-bottle, as the amount could be easily regulated and the bottle was not easily broken. He now used a nasal tube passed back into the pharynx, which ensured a free air-way even if the jaw muscles became stiff, and the tube could not be occluded even if the epiglottis and tongue fell back. Most hospitals were provided with Clover inhalers, and he had suggested McCardie's proportion of one drachm of chloroform to each measure of the inhaler; he preferred the open method. Less chloroform and more ether had been given in home hospitals than in the past year with increased safety to the patients. With regard to anæsthetics in special cases, he thought that in *shock* too much morphia could not be given, but it should be avoided in septic cases, and in patients with malaria or heart trouble. In these cases chloroform should also be avoided. As little anæsthetic as possible should be given, and it should be diluted with oxygen, which could be bubbled through the ether. Nitrous oxide and oxygen were valuable, but the apparatus militated against its use, and he was not satisfied as to the anæsthesia which was produced. Warm ether was of advantage in these cases. Continuity and regularity were great points in success. In *intracranial* cases morphia was unnecessary, and here also very little anæsthetic should be given. He preferred chloroform as it lowered venous congestion. In *empyema* the mortality was severe. For these cases he preferred intratracheal methods and thought that the patients should be concentrated in the better equipped hospitals where this apparatus was used. Otherwise he preferred chloroform and oxygen. In *spinal cases* the patient had to lie on his face and the chest was consequently compressed, so that the anæsthetic had to be pumped into him, and venous congestion was always present. He thought chloroform and oxygen the most desirable method. In *orthopædic surgery* spinal anæsthesia was not used as much as one might have supposed would be the case. Nitrous oxide was often used and acted well when given with ether, but venous congestion should be avoided; warm ether produced this. In *plastic surgery* of the face and allied conditions the chief difficulties were caused by the blood and mucus which collected in the mouth and pharynx; there was also the difficulty of manipulating the anæsthetic with a fixed or very mobile jaw. In the majority of cases exceptional methods were necessary, and of these he mentioned four: 1. *Intratracheal.* This was not necessary in all or even in the majority. 2. *Intubation* was little known in this country, but had many advantages; it was easy to introduce Kuhn's tube, which could be packed with gauze round the pharynx, thus preventing blood from entering. 3. *Rectal ether-oil* method. In this there were two important points: (*a*) the patient should have morphia and atropine before; and (*b*) the anæsthetist should himself see that all remnants of ether-oil were washed out of the rectum. 4. *The sitting position.* In this the patient sat bolt upright and anæsthesia was produced by passing oxygen and chloroform or other vapour through a nasal tube. This method had been in use for over a year at one of the principal facial hospitals, and so far no fatality had occurred. The speaker asked for views as to the cause of ether bronchitis.

Mr. BELLAMY GARDNER said that in the nasal air tube a very important method of overcoming a difficulty had been evolved. Apart from the adoption of the mouth prop the only other suggestion was tracheotomy. He thought the mouth prop should always be used.

Dr. J. BLOMFIELD said that in plastic surgery he had been led to appreciate the intratracheal method.

Major H. D. GILLIES, R.A.M.C., said that, by Colonel Silk's advice, he had adopted the sitting position and also intratracheal methods. In plastic surgery an anæsthetist was needed who could give every known form of anæsthesia. It was often impossible to use the intratracheal method owing to the form of injury. The sitting position had the advantage that the tongue and jaw tended to fall forward. Nitrous oxide and oxygen had given good results. Each case had to be considered from the anæsthetic point of view. The intratracheal was the ideal method if it could be done. Kuhn's tube was a good substitute, but the large apparatus in the mouth was a disadvantage. Chloroform and oxygen given through the nasal tube, with the patient in the sitting position, had given good results.

Dr. F. E. SHIPWAY said that he always induced with chloroform and ether on the open mask and then continued with ether. He did not agree with Colonel Silk's opinion that too much morphia could not be given in cases of shock. Morphia was a depressant, reduced temperature, lowered blood pressure, and diminished excitability, thus producing a condition similar to shock. When shock had developed he thought that morphia should not be given in larger doses than 1/6 of a grain, or 1/4 grain at the outside. In empyema he preferred ether or warm ether. Light anæsthesia was very necessary. In facial cases he preferred intratracheal ether, and in only 6 per cent. was he unable to pass the catheter. The advantage to the patient was the absence of post-operative vomiting—a consideration when many operations had to be done. Sickness could not be avoided after chloroform in the sitting position. Ether-oil per rectum was occasionally a very valuable method, but he doubted if it were free from danger on account of irritation of the lower bowel. Mr. H. M. Page had suggested less ether, but Major Gillies found that less than the amount recommended by Gwathmey was not enough.

Captain H. EDMUND G. BOYLE, R.A.M.C., said that it was both wrong and dangerous to induce with chloroform; ether or a mixture of gas and ether should always be used. He did not agree that the apparatus militated against the gas and oxygen method. Speaking of plastic surgery, he said that he had anæsthetised 23 cases with ether-oil per rectum and had tried to change the dosage. He now used paraldehyde 1 drachm, olive oil 2 ounces, and ether 4 ounces. He had had no cases of irritation of rectum. He thought the mouth prop should always be used, and that the nasal tube was not needed.

Mr. PERCIVAL P. COLE said that very well-trained anæsthetists were necessary for plastic operations on the face. He thought it was rarely impossible to pass the tube. Kuhn's tube was not so good, as the operations usually lasted a long time, and the physical exhaustion produced on the patient by breathing through Kuhn's tube was marked. This did not occur with the intratracheal method. Vomiting was rare.

Colonel SILK said in reply that the ether-oil method required care. He had never had a case of rectal irritation. In shock he recommended a quarter to half a grain of morphia. He was pleased to find that the meeting was so thoroughly in accord with his condemnation of undiluted chloroform for routine use in military hospitals.

Dr. H. R. PHILLIPS demonstrated an apparatus for administering oxygen with ether and chloroform. The oxygen, contained in two cylinders, was passed through hot water contained in a copper tank, and thence through the chloroform or ether, or through both.

Reviews and Notices of Books.

The Cancer Problem: A Statistical Study. By C. E. GREEN, F.R.S.E. London: W. Green and Son, Limited. 1917. Pp. 140.

Cancer, its Cause and Treatment. By L. D. BULKLEY, A.M., M.D., Senior Physician to the New York Skin and Cancer Hospital. Vol. II. New York: Hoeber. Pp. 282. Price $1.50.

1. DISCARDING the conventional methods of death-rates per illion living favoured by the generality of statisticians, Ir. Green presents his figures in the form of one death from ancer in so many deaths from all causes, and perhaps to ow his contempt for the paper-economy campaign he ives the same data over again as deaths from cancer in 00 deaths from all causes. The product of the correspond-g figures in the two columns being 100, one or other is dundant. This arithmetical comedy occupies eight large arto pages devoted to England and Wales alone, and ver a word as to the year or years to which the figures fer. This probably accounts for our failure to find any mple arithmetical relation between Mr. Green's figures and ose of the Registrar-General.

2. Dr. L. D. Bulkley advocates very definite views in his ok on cancer, of which Volume II. is in our hands. e believes that cancer is a disease of disordered meta-lism set up by an unphysiological mode of life, and rticularly by dietetic errrors, causing constipation and perfect excretion of waste products. A strict vegetarian et (butter and eggs are allowed, but not milk), abstinence m alcohol and tobacco, with the administration of tassium salts, constitute the treatment he recommends. r this regimen he claims the cure of cancer without opera-n, the prevention of recurrence after operation, and a ong probability of prophylactic value if adopted before the ncer age. Dr. Bulkley's condemnation of the surgical atment of cancer is only slightly tempered by regard for surgical colleagues of the New York Skin and Cancer spital. Dr. Bulkley is unconvincing.

ientials of Medical Electricity. By E. R. MORTON, M.D., and E. P. CUMBERBATCH, M.A., M.B., B.Ch. Oxon. Third edition, revised and rewritten by Dr. CUMBERBATCH. With 11 plates and 72 illustrations. London and Glasgow: Henry Kimpton. Pp. 303. Price 6*s.* net.

THE present edition, the work of Dr. Cumberbatch, has n entirely rewritten "so as to include the new methods l at the same time present the subject in the light of the ver and clearer knowledge of the way in which electricity s in the cure or relief of disease." In Chapter I., mmencing with an account of the theory of ionisation, strations are given of the manner by which electrolytes y be produced within the body either at the entrance, the of the constant current, or along its path between the electrodes; also of the means by which new electrolytes y be introduced into the system from without. During its sage the current stimulates the nerve-endings of the sensory ves and the afferent end-organs within the muscle and . With an interrupted current of certain strength and ation the muscles themselves contract. In the high-quency current, where the frequency of reversal becomes remely high (one million or more per second), there is no scular contraction, no apparent stimulation of nerve, but is developed. The remainder of the chapter is devoted short description of the *modus operandi* of the static eze, the high-frequency effleuve, the static spark and ic wave current. In Chapters II., III., and IV. we find account of the application of the constant current, and modifications—simple, interrupted, sinusoidal, slow soidal, and the faradic current—accumulators and dry s. The principles of ionic medication are fully discussed in pters V., VI., and VII., and its application to medical and ical treatment, including such cavities as the antrum, the n and rectum, and the sinuses left after wounds; also the oval of nævi, stellate veins, moles, warts, and superfluous . Chapter VIII. refers to the effects of electrotherapy as neral stimulant to the tissues. Chapter IX describes the trical treatment of various paralyses, including that of facial nerve, trapezius, sternomastoid, serrati, deltoid, ati muscles, of the arm and of infantile paralysis. Chapter X. gives a detailed report of the methods of testing the reactions of muscle and nerve, including that of condenser discharges, which may at the present time be considered to hold the field. The war has produced innumerable cases of paralysis after gunshot wounds in which a knowledge of the condition of the nerve and its muscle becomes essential. Still more recently the subject has been studied by the employment of a galvanic current of known and variable strength, and the relative value of the two is still *sub judice*. An explanation of the methods of production and application of high-frequency currents follows in Chapter XI., and leads naturally to the excellent account of medical and surgical diathermy, on which subject the writer is a well-known authority. A short chapter deals with static electricity, the static bath and breeze, the wave current, and the static induced current, with the technique required for each. Chapter XIV. contains a valuable alphabetical index of diseases in which electrical treatment may be employed and the suitable modality for each affection. The final chapter gives an explanation of certain physical principles of electricity, a knowledge of which is essential to the electro-therapeutist.

A comparison of the second edition (1910) with the present issue demonstrates the considerable advance which has been made in several directions, notably in the more general employment of ionisation, the more efficient examination of the electrical reactions of muscle and nerve, and particularly in the applications of medical and surgical diathermy. The work is well illustrated, the style is attractive, the matter is excellent and up to date. It may be recommended as a guide to clinical assistants in the electrical departments of our hospitals, and should also find a place in the library of those who follow the practice of electro-therapeutics.

Kala-Azar: Its Treatment. By UPENDRANATH BRAHMACHARI, M.A., M.D., Ph.D., Rai Bahadur. Calcutta: Butterworth and Co. 1917. Pp. 121. Price 8*s.* 6*d.* net.

THE first five chapters consist of numerous treatments, the relative merits or demerits of which it is not easy to estimate as the data supplied are insufficient. It is quite natural that in seeking for remedies for a deadly disease very many should be tried, but it is most unsatisfactory that therapeutic methods should be advocated which are unsupported by adequate evidence. The record of "permanent recovery in 25 per cent. of cases" by quinine treatment conflicts with the author's statement that "quinine is worse than useless." The remaining chapters are mainly concerned with the use of antimony in the treatment of the disease. We cannot from the information supplied form an opinion as to the real value of antimony in kala-azar or estimate whether colloidal antimony advocated by the author has any particular advantage over tartar emetic.

The mode of determining the value of the various treatments enumerated is simple. We have in kala-azar a parasitic disease, and in this case it is the parasiticidal value of a particular drug that we wish to know. The conditions necessary for solving the question are: (1) Determination of the presence of parasites in all cases observed; (2) determination in how many cases parasites spontaneously disappear; (3) determination in how many cases parasites disappear (temporarily or permanently) after drug treatment. Systematic work on this plan would be of value; the treatment of a few cases with this or that drug is almost valueless. The author's opinion that a combined antimony-soamin-electrargol-formaldehyde treatment will be better than any hitherto adopted does not give us much confidence.

Modern Man and His Forerunners: A Short Study of the Human Species Living and Extinct. By H. G. F. SPURRELL, M.A., M.B., B.Ch. Oxon., F.Z.S. Illustrated. London: G. Bell and Sons. 1917. Pp. 192. Price 7*s.* 6*d.* net.

Dr. Spurrell has written an extremely interesting book—indeed, it may be said that he has written two interesting books, for we are inclined to regard the pre-war portion as distinct from what may properly be termed the war book. We have in the pre-war portion a constructive effort to outline the probable phylogeny of modern man, and in the war portion a philosophic discourse upon civilisations past and present and speculations upon the ultimate destinies of humanity. Both parts are written in an engaging style, making the book easy and pleasant to read.

The first part deals with the probable primate ancestry of man and with the known fossil human remains. We note

in this part three distinct features for analysis, though some dissection is necessary for their discernment, since all are blended together into a single interesting entity. First there are records of observations made in many parts of the world upon man and his provable mammalian allies. Here we meet with a certainty in touch which must impress any reader; and here, beyond doubt, is matter of permanent value. Next there are speculative deductions as to the early attainment of human characteristics; again there is firmness in the handling of the subject. Finally, there are accounts of the fossil remains of man, and deductions as to the actual early forms of the human race; here, although the style is easy and attractive, the touch appears to be less certain, and complete confidence seems to be expected from the instructed reader through the medium of a pleasing phraseology, rather than from the author's deep or critical examination of recorded facts. Such, in broad outline, is the structure of what we are regarding as the pre-war portion of Dr. Spurrell's fascinating book.

In the second portion of the book Dr. Spurrell reveals himself as a philosophic essayist, one armed with a wide classical and historical knowledge, a judicious (if somewhat pessimistic) turn of mind, and a facile pen. To review his essay in critical spirit is to spoil an intellectual treat for the reader. The whole essay forms a delightful study. It is possible that for some the impending gloom, which seems for ever ready to be written into these philosophic passages, will appear unjustified. There are many at hand buoyed up in the belief that after the war humanity will enter upon a better, a fuller, and a higher phase of evolution. There are many who hold as a cherished creed the belief that civilisation itself may evolve, and that far from being a hard taskmaster for its myriad slaves, it will itself become the servant of humanity. But it matters not what may be the ideals or the creeds of the reader; he will find himself vastly in the debt of Dr. Spurrell.

JOURNALS.

Revista de Medicina (Cartagena).—Trichinosis is a little-known disease in this country. That it is still, however, capable of proving a serious scourge is shown by the unfortunate experience that in 1914 befell Algar, a small township a few miles from the Spanish seaport Cartagena. Under the title, La Epidemia de Triquinosis del Algar, del Año 1914, Dr. Antonio Rosique gives in the *Revista de Medicina* an interesting account of the epidemic. The total number of cases was 275, of which 104 were severe, 63 of medium intensity, and 108 light cases. Dr. Rosique began by treating his cases on the lines laid down in the text-books, but was very soon convinced of the absolute inefficacy of the classic methods of treatment. "The first deaths," he says, "and the rapid increase in the number of serious cases made one fear a veritable hecatomb, and the epidemic, in view of its gravity and of the large number of persons attacked, not merely authorised but imperiously called for the trial of other methods." Five different drugs were put to trial by Dr. Rosique—namely, emetine hydrochloride, methylene blue, grey oil (injectio hydrargyri hypodermica), neosalvarsan, and cyanide of mercury. Emetine was found to be absolutely inefficacious, while methylene blue was not merely useless but seriously objectionable, in that it caused nausea, diarrhœa, partial suppression of urine, and painful abscesses which were slow to heal. Grey oil was found to be of great value and, in the doses employed, entirely free from objection. Of 107 cases treated, of which 49 were grave, all recovered, only a few reaching the cachectic phase. Against the trichina neosalvarsan proved itself a drug of great activity, "veritable resurrections" being witnessed in some very grave cases in which it was administered. It should not, in Dr. Rosique's opinion, be used in cases in which the nervous system is much involved, as it is in these cases inefficacious and somewhat dangerous. Of 20 cases treated by neosalvarsan 2 died. The cyanide of mercury is, says Dr. Rosique, "the medicament *par excellence* in the treatment of trichinosis in all its forms and in every degree. It is admirably borne by the patients, and in not one single case, not even in the gravest, did improvement fail to show itself immediately after the first injection. We recommend as the treatment of election in trichinosis, being the most efficacious known to us at present, intravenous injections of cyanide of mercury. Of 22 cases treated, 3 being of extreme gravity, all improved rapidly from the commencement of the injections. None died. The dose employed was from 4 to 7 centigrams." Dr. Rosique summarises as follows: "Trichinosis is not a disease in the presence of which, as the profession had almost come to believe, the physician can do no more than fold his arms and adopt an expectant attitude while watching the struggle between the disease and the organism. It is a disease curable in every case by the timely employment of what we may describe as its specific remedy, mercury, given either in the form of grey oil in large doses by deep intramuscular injections, or, better still, in the form of the cyanide of mercury by intravenous injection. Treated by this drug not a single case of the disease ought to be lost."

Maternity and Child Welfare. Vol. I., Nos. 9 and 10. Price 6*d.* net each.—The August number of this periodical was mainly concerned with baby welfare exhibitions, and this number (September) with nursery schools and the possibility of their development under the new Education Bill. Miss Margaret McMillan's article on this subject is inspiring; her idealism does not make her unpractical. Possibilities of closer coöperation between rescue-workers, hospital authorities, and other organisations dealing with unmarried mothers and illegitimate children are discussed in an interesting article by Miss H. M. Morant, and a useful list of homes for these children is given under the heading Child Welfare Directory. The illustrated notes on the Child Welfare Exhibition at the Central Hall last July are especially useful to those about to organise local exhibitions, and that dealing with the work of the Royal New Zealand Society for the Health of Women and Children is of extraordinary interest. The problems connected with the care and upbringing of the illegitimate child and the complete lack of adequate State control in the matter are ably dealt with in No. 10 of this publication. A most amusing imaginative description of "How our Infant Mortality was Halved" is written by Graeme Halkerston. The excellent Atlas and Gazetteer is continued, and there are interesting articles on Infant Welfare in Paris, on Mothers' Clubs, and on Air Raid Precautions and Ventilation, by Dr. S. Davies.

Archives de Médecine et de Pharmacie Navales.—In the number for June, 1917, we find an interesting account by Dr. Pélissier, staff surgeon in the French Navy, of the experiences of a party from the *Ernest Renan* battleship, which formed part of the international force sent to occupy Scutari in May, 1913 in the second stage of the first Balkan War, when the Balkan League was beating Turkey down. They arrived in the town some little time after its capture from the Turks, and found it, like any town after a siege, very dirty. They cleaned up barracks for themselves and appear to have suffered little from illness, though much from flies, and a great deal in May from a plague of fleas. Thanks to quinine and mosquito-nets they escaped malaria. They found the water-supply had been investigated bacteriologically by the Turkish physicians and passed as safe, but when the warm weather came on they sterilised all drinking water, at first by boiling, but as that proved awkward it was replaced by a chemical method, 6 per 10,000 of permanganate of potassium being added for half an hour, and then 2 per 10,000 of tartaric acid. After an hour's sedimentation the water, now sterilised, was used for drinking. The quantities of reagents were clearly in excess of what is necessary. The Turks are stated to have had but poor ambulance service, and the fortune of war was always against them; the Serbian service was well organised, while the Montenegrin wounded had only the care of two brave and devoted French Red Cross workers, Dr. Ratel and Mdlle. Fricht. The descriptions of the battle-fields of those old days, with their barbed wire and shell-holes made by three- and four-inch shell, are commonplaces of to-day, but Dr. Pélissier, if his report was, as we suppose, written and sent in in 1913, deserves credit for his early appreciation of the greater incidence of wounds on the head and shoulders in modern fighting, and for his clear statement that many men were lost through wearing caps which should be replaced by protective head coverings. An astonishing instance is given of endurance. An Albanian was shot through the abdomen from front to back; he fell backwards into a marsh in which he sank up to the neck. There he remained for a week, the only person to come near him being another Albanian who went through his pockets. On the ninth day he was taken to hospital, when his wounds were found closed, but his hunger was noted to be wolfish. He recovered easily.

Rhéantine is put up in hermetically sealed tins, containing 28 spherules.

Dosage : Two spherules twice a day.

Rhéantine is the Entero-vaccino-therapeutic method in regard to Gonococcic Treatment. Messrs. Lumière and Chrevotier had since 1913 been undertaking a fresh series of experimental and clinical researches with reference to this subject. After considerable difficulties in their endeavour to find a suitable medium for the cultivation of Neisser's diplococcus, they discovered one based on the wort of beer, which perfectly answered to their requirements, and succeeded in preparing desiccated cultures, in vacuo, forming a perfectly anhydrous and stable vaccinal powder, containing about 500 millions bacilli per milligramme. This is administered in keratinised spherules. The clinical effects of Rhéantine on gonorrhœa in its various stages and in the complications of the disease are rapid, well marked, and of the most encouraging character.

From a Paper read before the Therapeutical Society of Paris (14*th June*, 1916) :—

..... "Under the microscope these successive changes are demonstrated in equally definite stages; whatever may have been the duration of the disease, the characteristics of the pus become rapidly modified; after two or three days' treatment the gonococcus, first intracellular, becomes exterior; it ceases to act as a parasite on the polynuclear leucocytes and the large epithelial cells—one then finds them disseminated outside the leucocytes.

"Finally, some days later, if the administration of Rhéantine is continued, the condition undergoes still further change, the gonococci become agglutinated, arranged in a mass, and finally bacteriolysed."

These clinical and bacteriological observations constitute irrefutable proof of the efficacy of antigonococcic bacterio-therapy by the gastro-intestinal tract.

The clinical reports of various doctors or noted by ourselves, show that antigonococcic bacterio-therapeutics are capable of giving highly satisfactory results, both in acute and chronic forms of urethral gonorrhœa and also in the various infectious complications due to Neisser's bacillus.

AMBRINE

Ambrine is *the only Authorised preparation* of Dr. Barthe de Sandfort. We are compelled to state this, as there are various imitations.

May be applied with camel-hair brush, but our specially designed spray greatly facilitates the application of Ambrine, especially in the case of deep wounds or extensive surfaces.

Ambrine forms a dressing which INSTANTLY alleviates pain—promotes rapid healing—forms a sure protection against infection of the wound—can be removed without pain, hæmorrhage, or injury to the newly-formed tissues. The healing leaves no scars or contractions.

The most efficient means and methods of ensuring active **Hyperthermal-Therapy** to the practical treatment of **Rheumatism, Gout, Arthritis, Varicose Ulcers,** and similar affections.

Rational Treatment of CONSTIPATION.

OPOLAXYL

By the double action of secretions and peristalsis.

Opolaxyl is a combination of the secretions of the liver (biliary), pancreas, and intestines, with vegetable extracts of a non-drastic nature.

It combines all the secretions to correspond to nature's therapy and promotes a flow of bile and glycogen.

It is a normal regulator of the gastro-intestinal functions; consequently it improves the metabolic changes in the entire organism.

Opolaxyl does not lose its efficacy by prolonged use; its effect is gentle and constant, with the least irritation. It is not merely purgative; it stimulates the defective organs and revives the normal equilibrium; it has a lasting effect by reason of it rebuilding the organs, thus correcting diminutional function.

Opolaxyl is put up in small size tabular form and should be swallowed without crunching at bedtime or before breakfast.

DOSE—For obstinate constipation 2 or 3 tablets, afterwards 1 tablet every 3 or 4 days for a month.

E———, Scotland, 8th Oct., 1917.

DEAR SIRS,—Having derived considerable benefit from the use of Opolaxyl tablets in my own personal case, I write as a practising physician to ask if you would make any reduction of price in the event of my sending you an order for a fair quantity, say, one dozen bottles.

Yours faithfully,

—— ——, M.D.

LONDON: SATURDAY, NOVEMBER 10, 1917.

The Causation of Disease.

THE study of causation in relation to any series of natural phenomena is one of the greatest interest to thoughtful and scientific minds, and at the same time it is beset with pitfalls and fallacies to an unusual extent. The investigation of the causes of disease is one of the most baffling problems in medical science, and yet it is among the most essential and fundamental studies for the scientific practitioner of medicine if progress is to be made on right and hopeful lines. Professor ERNEST S. REYNOLDS, in choosing this problem for the subject of his Bradshaw lecture, delivered before the Royal College of Physicians of London on Nov. 8th, briefly reviews the whole field of medicine and has endeavoured to render more precise our conceptions of the actual causes of disease, and in so doing to evolve a practical nosology based on causation—which is obviously the most scientific form of classification. In so doing he has produced an instructive and stimulating essay which will well repay thoughtful consideration and study. He begins his observations with some definitions, always a difficult matter, and then makes brief reference to the methods available, from the logical and experimental standpoints, for the investigation of causes, in which he acknowledges his indebtedness to the work of Dr. CHARLES MERCIER. Professor REYNOLDS confesses his surprise at not finding a satisfactory definition of disease, and he is of opinion that we may safely define "disease as that condition of an individual in which there is, apart from the normal changes due to age, an alteration of the structures or functions or sensations usually found in the average man of any particular race." We may agree that this offers a comprehensive conception of disease, and that it is an advance on that usually offered—viz., that disease is the opposite or converse of health. At the same time the confusion between disease as a generic term and diseases as applied to individual instances of abnormal conditions remains, and we may quote from an old and honoured text-book of medicine[1]: "In truth both Disease and Health are incapable of precise definition because they are not scientific terms. They are descriptive, popular, and subjective. 'Disease' is 'discomfort.' Whatever causes bodily uneasiness or whatever by experience will sooner or later cause it, whatever interferes with our bodily functions, whatever tends to death, is disease." The difficulty of definition indicated in the famous text-book remains.

Professor REYNOLDS clearly distinguishes between effect, result, cause, and condition, and for these fundamentals he adopts Dr. MERCIER'S excellent definitions. The last two of these we quote, cause being regarded as "the action or cessation of actio nected with a frequent change or accompa unchange in the thing acted on," while con is "a passive state of or about the thing acted a cause and material to the effect." It will be therefore, that under this arrangement the f of age, sex, climate, and previous history, whicl formerly classed as predisposing causes, sho the interests of scientific accuracy be classif predisposing conditions, and the word cause s confined to the actual exciting action or dy cause. We are cordially in agreement Professor REYNOLDS in emphasising this pc view, since it tends to render more p the conception of causation and to make for accurate investigation. The exposure of fal in regard to causation is a most important m and Professor REYNOLDS draws attention to may be considered the two most common c namely, the *post hoc, propter hoc* fallacy coincidence. The former of these he paraph aptly with the remark: "It cannot be too str asserted that mere sequence does not est causation." And he points out the danger c fallacy of pure coincidence, which is no doub to the dramatic appeal it makes to consciou To eliminate such fallacies the greatest c necessary in applying the methods of investig cause and effect.

In order to reduce the problem of the clas tion or analysis of causes of disease to its sin Professor REYNOLDS considers it in parabolic He imagines 1000 healthy men and 1000 he women, each aged 20 years, free to marry and no hereditary taint, put to live in a per healthy island with sufficient flora and to maintain life: and then he attempts to cast the various affections from which and their progeny to two or three genera are likely to suffer if free from admixture fro rest of the world. Under such conditions we assume that the factors of causation woul easier to trace, and Professor REYNOLDS g them under ten headings—namely, injury, foo feeding, poisons, occupation, stress, abnormal bolism, abnormal age changes, neoplasms, para and heredity. He suggests that if unrestr immigration into the island were permitte should not introduce any new group of caus disease, but there would be a marked intens tion of at least three of them—namely, stress increased competition, parasites, and heredity. problems of causation of any disease of ob origin may thus be considered in relation to groups of causes, and in illustration of this Prof REYNOLDS takes a disease in which he has interested and upon which he has made observations—namely, disseminated sclerosis, uncommon disease of which the morbid anato established, but the causation and pathology of w are obscure if not unknown. He thinks that careful study of the disease and the condi under which it occurs, we can eliminate in food, occupation, stress, age, neoplasms, and here also extrinsic poisons, thus leaving intrinsic poi altered metabolisms, and parasites or their to

[1] Fagge and Pye-Smith: Text-book of the Principles and Practice of Medicine. Third edition, vol. i., p. 2. Churchill, London, 1891.

for consideration. By applying certain of Dr. MERCIER'S criteria, he comes to the conclusion that disseminated sclerosis is caused by a poison acting on certain special nerve tissues; but whether it is due to intrinsic poisons from perverted internal secretion or derived from the alimentary canal, or to some specific organism as yet undiscovered, he admits that it is not possible to determine at present; and he points out the important field of research here available and the similar problems awaiting solution in regard to other diseases, such as rheumatoid arthritis and spleno-medullary leukæmia.

There would seem to be little to criticise in Professor REYNOLDS'S ten groups of causes, though to utilise them for purposes of the classification of diseases is not quite so simple as might at first sight appear—and it is only fair to him to admit that he recognises this. Allowing for the fallacy of regarding conditions as actual causes, there is still the possibility of multiple causation to reckon with, and in this event a given disease might well come under two or more of the causative headings. Again, the vital reaction to different causes may be identical; for example, Professor REYNOLDS is prepared to admit that the effect of "cold" may be to induce a condition of nephritis analogous to that produced by micro-organisms or their toxins. A further difficulty may conceivably arise in connexion with poisons, since they may be extrinsic, intrinsic from metabolic defects, or they may arise from the activities of parasitic organisms, either animal or vegetable, either in the alimentary or respiratory tracts, on the surface of the body, or in the tissues themselves; the exact classification of diseases produced in these ways might be a matter of some difficulty with our present knowledge or lack of it. We need only instance the effects of intestinal stasis in illustration. The construction of most modern text-books of medicine is a striking illustration of the difficulties of classification of diseases. We could wish for some uniformity in this matter, both in text-books dealing with clinical or descriptive medicine and those devoted to prevention. Obviously the etiological classification is the ideal one, for a knowledge of causation is essential for prevention and highly desirable from the points of view of diagnosis and treatment; though it is well to recognise that an effective treatment can be discovered for a disease of unknown causation, and that the discovery of the cause does not necessarily at once lead to the evolution of a specific treatment. It is evident that even so simple a grouping of causes as that offered by Professor REYNOLDS would not be satisfactory for a text-book classification of diseases, and that the present compromise arrangement, which is partly etiological and partly topographical, though unscientific, is yet convenient, especially for purposes of reference. This, however, does not detract from the value of real classification and is no criticism of it, but only a confession of the gaps in our knowledge and of the need for accurate and combined research into causation upon the lines laid down in the Bradshaw lecture.

Medical Students and the Shortage of Medical Men.

AT the commencement of the war much difference of opinion was manifested as to the advisability of using medical students for combatant service, it being clearly seen that if this policy was pursued in any general way there would sooner or later be a shortage of practitioners in this country. It was not foreseen that the shortage would actually affect us during the war, for those who put the duration of the struggle as three years at the outside were regarded, especially by those who knew least, as unduly pessimistic. But it was widely pointed out that even a war of two years' duration, if it shut off all recruits from the medical profession, would have an evil outcome that was not receiving sufficient consideration. The medical profession is wanted with equal urgency for military and civilian purposes, and it is a profession whose briefest range of training must be taken at from five to six years. The policy of suspending all recruits to its ranks must therefore be dangerous, though it would, of course, be justified by the knowledge that the addition of our potential medical men as combatants to our army, when numerically so small, was a factor of greater importance. And this is how the matter came to be regarded by those in authority in the early days, and the view taken by Lord KITCHENER was backed by the spirit of the medical students themselves, who with unanimity declared their intention of joining the forces at the earliest opportunity. The question was one of policy, and one on which men of equal ability to judge differed strongly; and as a result a compromise scheme was employed whereby senior students, who were enrolled in the combatant ranks, were recalled by the War Office and directed to complete their curriculum with a view to qualification for the Royal Army Medical Corps, the junior students being subject to enlistment or encouraged to train as officers.

It would seem that this compromise was also based on the probability that the war would be over within two years. In that case the measure of its inconvenience to the country would be that when a shortage of qualified medical men occurred it could only be partly compensated for by the increase in the number of qualified medical women. But during 1915 and 1916, as during this year, it became clear that the shortage of practitioners due to a decreased number of qualified men registered, would have effect for a longer range of time than was estimated, and would be aggravated by a growing depletion among those who were qualified, whether carrying on medical work with the Navy and Army or at home. We have a total medical service of so many thousand men—the figure is not given because it varies enormously according as to what we include as effective—of whom at least half the effective on any basis of calculation are now in naval or military employ. Of the remainder a large proportion are not in military employ because of their age although their professional work is most valuable. In both these classes it is clear that the death-rate

will be comparatively high. We know that the number of medical men who have been killed or disabled in discharge of their duties with the Navy and Army forms an appreciable percentage of the great number employed, while it is obvious that at the other end of the scale, among the men of advanced age, the death-rate from natural causes must operate with force. We have therefore now a double wastage in a service which is absolutely necessary for the well-being of the nation as a whole, and for its fighting forces by sea and land—the two things are not separable, for the quota that is not fighting is working, against time and against fatigue, to support the combatant quota. But no recruits are coming in to this diminishing section of the national activity save a certain number of female practitioners. The drain will continue to be met, and only in few districts is there any sign yet of an inadequate medical service, judged by the standards of real safety; but it is a serious thought that this position may have to continue for some undefined period after the war.

Last week an unauthorised statement was published in a lay paper to the effect that within the next few days all the medical students who were serving in combatant positions in the Army would be demobilised and sent back to their medical schools. The information was not correct, if only because it has not yet been decided exactly what move in this direction will be taken by the authorities; but we are glad to learn that the matter is receiving official attention at the present moment. It is to our mind an enormously important question, and we are very glad to learn authoritatively that it is being treated as such. We are perfectly aware that man-power must always be of paramount urgency in every practical course undertaken by a War Minister or a War Council, while the sacrifice of life that has necessarily taken place among our young combatant officers puts a special value for military purposes on the very class of youth who had already embraced, or who had intended to embrace, the calling of medicine. Those wanted as young doctors are exactly those who are wanted as young officers. Seeing all this, we do not think that the policy of those in authority in 1915 was wrong for its time and in its circumstances, but none the less we are glad to learn that it may be revised now. We should like to hear that all medical students at present in the Army, who had begun study in the direction of medicine before the war broke out, have been permitted to return to their schools, but so sweeping a policy cannot be followed out. The figures produced to the Army Council do not, as yet at any rate, warrant this while other difficulties as to the status of students present themselves. Meantime students who had begun their curriculum prior to August 1st, 1914, and had at the time of enlistment completed two years of the course, may claim to be returned to their studies under the Army Council Instructions of 1917. They must proceed to get their qualifications with all possible expedition. That the conduct of medical schools is impaired by the war is, of course, obvious, but if the teaching staffs are thinned the supply of material is sadly abundant, and the schools should be more flexible in their conduct of education during the hour of stress. We do not want to meet the case of the shortage of medical practitioners by lowering the standards of practical efficiency for those who prepare to enter our portals, but by as much as the academic side of their training or examinations can be abbreviated, and the practical work of pathology attacked directly, by so much the quicker will the existing troubles be arrested.

Annotations.

"Ne quid nimis."

THE SCIENTIFIC BOYCOTT.

AT a meeting of the Société Internationale de Chirurgie, held in Paris on Nov. 3rd, and attended by delegates from Belgium, France, Great Britain, Serbia, and the United States, the following course of action was agreed upon:—

1. The Société Internationale de Chirurgie will be dissolved, as after the publication of the volume of Transactions of the meeting held in New York on April 14th, 1914.

2. If there should be any assets after the publication of this volume the money will be divided *pro rata* amongst the members, so that each member of the Germano-Austrian group shall receive his share, but the shares belonging to members of other nations will be retained and applied to some object of scientific repatriation in Belgium.

3. A new society will be formed after the war on a basis similar to that of the Société Internationale de Chirurgie to be called the Société Interalliée de Chirurgie.

This society will also be open to such surgeons of neutral countries as may be nominated for election by the general committee, and the purport of the dissolution of the old international gathering will be achieved by the exclusion of the Austro-Germanic adherents.

INFUNDIBULAR TUMOUR IN A CHILD CAUSING DIABETES INSIPIDUS AND TOLERANCE OF ALCOHOL.

THE following case is reported by Dr. L. Newmark, of San Francisco, in the *Archives of Internal Medicine* for April last:—

The patient was a child of 14, who developed unquenchable thirst about the age of 9. It was ascertained that the boy used to drink as much as two gallons of water during the night and that a bucket of a capacity of four gallons was placed in his bedroom as a urinal and was regularly found half filled in the morning. The father added that the urine looked like the water the child drank. Its specific gravity varied between 1002 and 1006; sugar and albumin were always absent. Gradually he began to crave stronger drink, and severe beatings at home did not deter him from various tricks to obtain wine. He would drink three or four glasses of beer in rapid succession or a similar quantity of wine. He took whisky also, it was discovered, but he was never drunk or affected by drink. After a bout, when four quarts and a pint of beer were consumed, he reported at school and performed his tasks well, as usual. He was also early addicted to cigarette-smoking. At the age of 14, when seen by Dr. Newmark, he was found to be a weazened but alert and agile little boy, who looked not more than 10 and had not grown, apparently, for some years. The discs were normal and no defect of the visual field could be detected. A month later, however, increasing headache was complained of, and on re-examination the discs were found to show early optic neuritis; anosmia was present on both sides; the polydipsia was extreme. X ray examination showed a normal sella turcica, while the visual fields remained normal. The child died a week later and at

the autopsy a tumour was found, springing from the side of the infundibulum and occupying anteriorly the space between the anterior commissure above and the optic tracts below. The chiasma was flattened over the basal aspect of the growth, which was mainly interpeduncular and had distended the third ventricle and separated the hemispheres at the base. Microscopically it appeared to be of epithelial origin. All that could be found of the pituitary body was the pars anterior and remnants of the pars intermedia, infiltrated in parts by the large cells of the tumour. The pineal body was very small and showed definite atrophic changes, with disappearance of cellular elements.

The association of diabetes insipidus with toleration of drugs has been noted from time to time, but the latter cannot be due merely to the activity of the urinary secretion, or, rather, this fails to explain the exaggerated insusceptibility in regard to alcohol and other substances. In the present case the brain was not affected by alcoholic draughts to which immaturity and the presence of a large vascular tumour might be supposed to render it peculiarly sensitive. On what this immunity depended is matter for investigation, but it appears clear that the tolerance of alcohol is independent of diuresis. As for the polyuria, there is still uncertainty as to its mechanism and even as to the organ involved. There is abundant evidence to connect polyuria in a general way with disease in the neighbourhood of the hypophysis, but beyond that lie the difficulties. Excessive function of the posterior lobe has been offered as an explanation, then diminished function, then "dysfunction"; others have left the pituitary altogether and brought forward experimental evidence incriminating the grey matter of the third ventricle, finding there a centre for the regulation of carbohydrate assimilation and the water content of the organism. Further, growths in the pineal body have been associated with diabetes insipidus. At present the medulla and the floor of the fourth ventricle figure much less frequently than they used to in the pathology of the condition.

THE CONJOINT BOARD OF SCIENTIFIC SOCIETIES.

In March last year, at the instance of the Royal Society, a conference was held with representatives of the leading scientific societies with the idea of establishing a Conjoint Board of Scientific Societies. The objects in view were that such a body should (1) promote the coöperation of those interested in pure or applied science; (2) should supply a means by which the scientific opinion of the country, on matters relating to science, industry, and education, would find effective expression; (3) should take such action as might be necessary to promote the application of science to our industries and to the service of the nation; and (4) should discuss scientific questions in which international coöperation seemed advisable. The scheme has since materialised: a conjoint board of scientific societies has been formed, and the personnel includes acknowledged leading authorities in every branch of scientific work. There has just been issued a report giving the aims, objects, and results of the first year's work (1916–17). Ten subcommittees were appointed and the majority have already presented final or interim reports. Amongst these are the International Catalogue subcommittee, the subcommittee on the Application of Science to Agriculture, the subcommittee on National Instruction in Technical Optics, the Watching subcommittee on Education, the subcommittee on the Prevention of Overlapping among Scientific Societies, the Metric System subcommittee, the Anthropological subcommittee, the Iron-ore subcommittee, the subcommittee on the Water-power of the British Empire, and the subcommittee on Timber for Aeroplane Construction. It will be seen that a very wide range of subjects is covered and the reports already furnished show where reforms are indicated and fresh organisations needed. The whole work is of supreme importance to the future welfare of the country and it is reassuring to find such a capable body of scientific experts giving their earnest attention to the problems presented.

STREPTOTHRIX INFECTION OF THE LUNG.

It has been noticed by several observers that the streptothrix is capable of producing in human beings pathological processes in the lungs, and this condition has been described under the name of pseudotuberculosis hominis streptothrica. A further contribution to the study of this interesting condition has lately been given by Professor Sanfelice, of the University of Modena,[1] who describes the case of a girl 14 years of age who presented all the symptoms of pulmonary tuberculosis, but in whom repeated examination of the sputum by every known method failed to detect the presence of Koch's bacillus. Subcutaneous inoculations with an emulsion of the expectoration were made in two guinea-pigs, and plate cultures in agar made of the same. One of the animals died after 14 days, and a small collection of pus at the site of inoculation developed colonies of streptothrix on agar plate cultures. The other animal died after 20 days with a small abscess at the site of inoculation, considerable enlargement of lymphatic glands, and small nodules in the liver, spleen, and lungs. Agar plates developed colonies of streptothrix, but in neither case were any acid-proof bacilli seen. Similar results were observed in plates developed directly from the sputum. The streptothrix isolated by Professor Sanfelice developed readily on the ordinary culture-media, both in the incubator at a temperature of 37° C. and at that of the surrounding air (15° C.). In plate cultures on agar the colonies did not attain a larger size than a pin's head, and were yellow in colour like those of *Staphylococcus cereoflavus*. Under the microscope they were composed of a thick network of fine filaments, which form at the periphery a bright ring visible to the naked eye. Plate cultures on gelatin had the same appearance, and there was no liquefaction of the gelatin. Broth cultures developed rapidly, not as a diffuse turbidity, but as minute granules which formed at the bottom without leaving any pellicle on the surface. Streak cultures on agar formed a soft yellow layer firmly adherent to the substratum, the surface of the layer being smooth and devoid of the wrinkles commonly met with in most streptothrices. Stab cultures in gelatin developed more freely on the surface than elsewhere, with the formation of numerous peripheral filaments, so that the culture assumed a star-like appearance. Unlike other streptothrices, development on potato was not exuberant, but after some days a thin yellow pellicle formed which was smooth and limited to the point of inoculation. Cultures developed for some days showed after staining numerous bacillary forms similar to *B. diphtheriæ* and a few long ramifying filaments. Emulsion of the plate cultures when inoculated into guinea-pigs produced typical lesions of pseudo-tuberculosis. From its morphological characters this streptothrix should, according

[1] Annali d' Igiene, Sept. 30th, 1917.

ofessor Sanfelice, be classified as belonging to group of micro-organisms which represent the of union between diphtheritic and pseudo heritic bacilli and the group of streptothrices cterised by long branching filaments, and develop on agar in compact layers with a led surface.

REGULATIONS IN REGARD TO OPIUM AND COCAINE.

Home Secretary has called the attention of ered chemists and other persons authorised the Defence of the Realm Regulations to n cocaine and opium to the fact that fresh tions have been made under the Defence of ealm Act as to the records which they are ed to keep. The new Regulations are as :—

lation 40B shall be amended as follows:—

r the substitution of the following new subsection for section (7):

(7) If any person—(*a*) prepares opium for smoking; (*b*) deals in or has in his possession any opium prepared for smoking; or (*c*) being the occupier of any mises permits those premises to be used for the pose of the preparation of opium for smoking or of sale or smoking of opium prepared for smoking; or is concerned in the management of any premises for any of such purposes as aforesaid; or (*d*) has in possession any pipes or other utensils for use in nexion with the smoking of opium or any utensils se in connexion with the preparation of opium for king; or (*f*) frequents any place used for the pose of opium smoking; he shall be guilty of a mary offence against these regulations."

the substitution of the following new subsection for section (8):—

(8) Every person who has dealings in cocaine or m (including sales to persons outside the United dom) shall comply with the following provisions: He shall enter or cause to be entered in a book kept the purpose such particulars with respect to all ings in cocaine or opium effected by him as the etary of State may prescribe; (*b*) he shall make the y with respect to any transaction on the day on h the transaction is effected; (*c*) where he carries usiness at more than one set of premises he shall a separate book in respect of every set of premises; e shall keep the book in some part of the premises hich it relates so that it shall at all reasonable times vailable for inspection by any person authorised in behalf by the Secretary of State, and shall allow person so authorised at all reasonable times to ct it; (*e*) he shall not cancel, obliterate, or alter ntry in the book or make therein any entry which true in any particular."

gulations close with the warning that if son fails to comply with any of the new ns he will be judged guilty of a summary

JPATION NEUROSIS OF THE LOWER LIMB.

the *Medical Journal of Australia* Dr. J. C. as reported the very rare condition of an on neurosis of the lower limb.

ient was a fettler, aged 54 years, who was quite about eight months before, when he noticed a tiffness in the left leg. This gradually increased revented him from doing his work properly, as rom walking. Although he felt perfectly well bed, and could do anything he liked with the leg g down, and when he arose and began to walk leg seemed all right, yet as he continued walking. ially if he tried to walk at all quickly, it failed ecame more and more flexed at the hip, and the the ankle, so that it could not be straightened was put forward to take his weight, but as rward to put his weight on it the foot came back he position of the right foot. Then he had to lean bent left leg and throw his right leg forward, and n that and swing the left forward again as far as ut as it was so bent and stiff he could not reach with it unless he bent his right knee and hip. iscomforts he felt were an aching in the left tendo Achillis and fatigue in the back. Unless he was very careful to watch this flexed left leg in walking he would be thrown, especially if he was carrying a heavy weight. For eight years he had been a fettler. His work was to clean iron-castings taken from the moulds, chip off projecting pieces of iron, and then polish them on an emery wheel. Some of these castings were 18 kilogrammes in weight and nearly a metre in width, and as the wheel was low he had to stoop down, flexing the hip and knee and foot, and carry the castings from just in front of him to a point considerably to his left, so as to grind the one-metre edge. This threw the whole weight on the bent left leg, while the right leg was in a position of abduction to the right and carried almost no weight. If he walked on the heels and kept the soles off the ground (which could only be done with the knees stiff) the leg was not thrown into spasm, and if he walked on the balls of the toes and kept the heels off the ground he did not get the stiff flexion. But directly he tried to walk in the ordinary way this came on. By fixing a back splint from the upper part of the thigh to the lower part of the leg, and so preventing flexion at the knee, walking was made somewhat easier and less uncertain, but the spasm was still present and resistance to flexion was fatiguing.

Occupation neuroses usually affect the upper limb. In addition to the well-known writers' cramp there is the cramp of pianists, violinists, flautists, milkers, seamstresses, tailors, cigar-rollers, telegraphists, diamond-cutters, and barbers. Dancers in ballets get a cramp of the calf, as do also treadle-workers, but the conditions are usually transient. No doubt the reason that the occupation neuroses affect the upper limb so much more frequently is that they are always concerned with skilled movements repeated at intervals, and such movements are obviously more commonly executed by the upper limb.

ARTIFICIAL SUNLIGHT.

WITHIN the last few years the therapeutic value in surgical tuberculosis of exposure to sunlight has become established, owing a good deal to the practice of Rollier of Leysin. Except in southern climates, however, or those of the high Alps, where the sun shines strongly throughout the year, winter causes an inconvenient interruption to the treatment, which generally needs to be of long duration. Accordingly attempts have been made to substitute for the sun's rays, when absent, an artificial light, employing until recently that furnished by the mercury-quartz vapour lamp. The results have, on the whole, been inferior to those obtained by natural heliotherapy, and in several communications lately the carbon arc light is mentioned as being preferable, it is conjectured as exerting greater penetrative power. Some workers at the Finsen Medicinal Light Institute, Copenhagen, have reported[1] on the subject. Reyn and Ernst summarise their experiences as follows: (1) The carbon arc light can satisfactorily replace the sun-bath; (2) light alone without other clinical means can cure surgical tuberculosis; (3) light baths are a valuable mode of treatment in lupus; (4) the carbon arc light is better for the purpose than the mercury-quartz, and should alone be used whenever possible. The varieties of surgical tubercle treated comprised lupus, favourable results being claimed in cases resistant to other measures alone, and tubercle of lymphatic glands, of bone and joint, of the peritoneum, and of soft tissues. The last-named lesions responded best. As a rule, ordinary surgical measures seemed to be combined with the light treatment, which was not directed only to the site of disease, but generally to the surface of the whole body. Other workers (Mol in Holland and Collin at a Danish sea bathing hospital) supplemented the carbon arc illumination

[1] Hospitalstidende, 1917, Nos. 19, 20.

with ordinary incandescent lights, claiming that the higher temperature obtained increased the skin reaction. As in natural heliotherapy, pigmentation is deemed a favourable sign. Seventy-five ampères are mentioned as a suitable strength of current. With the winter months upon us, and at a time, too, when tuberculosis of all kinds, unfortunately, is rife, it might be well for this form of treatment to be tried here more than is at present the case. Little more than a year ago, indeed, the number of therapeutic mercury-quartz lamps in this country could be counted on one's fingers.

THE PRELIMINARY EXAMINATION OF THE ENGLISH CONJOINT BOARD.

THE Royal Colleges of Physicians of London and Surgeons of England have revised the Regulations relating to the Preliminary Examination required for the Diplomas of the Colleges. Under the new conditions Latin is now an optional subject, and a larger range of optional subjects has been adopted. A candidate must pass in: (*a*) English; (*b*) Mathematics; (*c*) one of the following languages—Latin, French, Russian, German, Italian, or Spanish; (*d*) a second language selected from the foregoing list or one of the following subjects—Higher Mathematics, Experimental Mechanics, Chemistry, Physical Geography, Physics, Botany, Biology, Geology. The revised Regulations come into force at once.

THE WHITEHALL RECRUITING CASE.

AFTER a prolonged ordeal of preliminary inquiry and trial at the Old Bailey Dr. A. M. R. Sinclair, a medical practitioner, was recently acquitted of the serious charge of conspiring to defeat the provisions of the Medical Services Acts in connexion with the passing or rejecting of recruits for the Army. In summing up to the jury Mr. Justice Salter pointed out that Dr. Sinclair bore a high character and had a good practice, and that there was no motive to cause him to take part in any conspiracy. He had received none of the money supplied by the military authorities and none from the man Grantway, who was afterwards convicted. There was no evidence, his lordship said, that Dr. Sinclair had ever classified a recruit unfairly or even incorrectly. As Mr. Justice Salter, at the conclusion of the evidence for the prosecution, had directed the jury to acquit one of the other men charged, it may have been wondered by some why he did not take a similar course in the case of Dr. Sinclair. The legal reason for this was sound and the course worked to the advantage of Dr. Sinclair, as was no doubt intended. By allowing the case of Dr. Sinclair to go to the jury the opportunity was given to explain or contradict things given in evidence which might otherwise have left Dr. Sinclair under some suspicion. By accepting Dr. Sinclair's evidence in his own defence, as it is clear that his lordship did, a full establishment of innocence was secured. Dr. Sinclair not only denied the charge, but he defied the War Office to produce a single recruit wrongly classified by him, and declared his own independence in examining the men fairly, in spite of an apparently official suggestion that all should be passed and dealt with later by the army surgeons who might attend them. Dr. Sinclair is to be congratulated on complete exoneration from a degrading charge, and will have everyone's sympathy in a grave ordeal.

THE DIGESTIBILITY OF BREAD MADE FROM TWO PARTS OF WHEAT AND ONE PART OF OATS, BARLEY, MAIZE, OR RICE.

BY E. I. SPRIGGS, M.D., F.R.C.P.,
AND
A. B. WEIR, B.Sc.
(*From the Duff House Laboratories*).*

THE proposition that barley, oats, maize, and rice are good human foods really needs no scientific defence, for the history of mankind relates that nations have been fed upon each of these varieties of corn; also our modern knowledge of their composition and many experiments tell us that they can supply the place of wheat in a mixed diet.

The measures taken by the Government to make good the lack of wheat by the use of other kinds of corn have, nevertheless, called forth some complaints. The mass of our people did not realise before the war that the cereals given to animals are good human foods; and did not know that by eating oats, barley, or maize ourselves we can get from them several times the food value that is obtained by turning them into beef or pork. The enormous amount of food which can be thus made available is shown by the figures of Professor T. B. Wood,[1] who calculated that of nearly 17 million tons of various kinds of corn used in this country before the war only 5 millions went for human food. This is less than the average production of home-grown corn, which amounted to 6½ million tons.

In an article written for the Ministry of Food in the spring of this year[2] the use of a mixture of barley flour, oatmeal, rice flour, or maize flour with wheat flour for making bread at home was suggested by one of us, in the proportion of one part of the meal to two parts of wheat flour or war flour. This is a higher proportion than has hitherto been used by millers in diluting wheat flour. The experiments here described were made to determine the digestibility of this bread so prepared.

These observations have no direct bearing upon the relative advantages or disadvantages of grinding into flour a larger or smaller proportion of the wheat grain. A good deal of work has been done on that subject, and was summarised up to the year 1911 in the valuable report by Dr. J. M. Hamill[3] to the Local Government Board. His conclusion was that "so far as relates to available 'digestible' protein and energy ..... the differences in nutritive value between different grades of flour made from the same wheat are usually insignificant when compared with the differences in nutritive value of flours made from wheats differing widely from one another in composition."

The Diet.

In our experiments we intended to have used a Government regulation wheat flour milled to yield about 80 per cent. of flour, but we were unable to obtain a certified sample of this, and therefore used a pre-war white flour for the basis of our breads, to which the other cereals were added.

In many researches upon the assimilability of different foods the food concerned has been given in such large quantities as to form the greater part or the whole of the diet. This method is capable of great accuracy, but the results obtained do not always apply when the same food is eaten with a mixture of others. Our object was to find out what changes, if any, took place in the proportion of fats assimilated from an ordinary mixed diet when wheat was replaced by a moderate amount of other cereals. The use of a mixed diet brings in sources of error. We have, however, special facilities for giving the same food day by day, as the staff is accustomed to the preparation and accurate weighing in grammes of many different foods.

For the present purpose those foods were chosen which could be had in as constant a form as possible over a period of several weeks, and the subject of the experiment also

* A summary of the experiments here described in detail was contributed to the discussion on War Bread, held at the Medical Society of London on Monday, Oct. 8th. (See THE LANCET, Oct. 12th, 1918, p. 572.)

ined for himself beforehand what dishes he preferred and ould find least tedious when repeated over the same period. ach day's food was prepared under the personal supervision one person, who also made the bread. The quantities of ur used were weighed out in the presence of one of us.
The diet was as follows:—

Breakfast: 2 eggs; butter, 20 grammes; bacon, 40 g.; rmalade, 30 g.; cocoa, 250 c.c., from 14 g. of cocoa; milk, c.c.
unch: Fillet of beef, 112 g.; potato, 56 g.; cabbage, 56 g.; e pudding, 130 g.; tinned pears, 200 g.; butter, 10 g.; am, 20 g.; black coffee.
ea: Butter, 20 g.; jelly, 20 g.; milk, 100 c.c.; cocoa, c.c., from 14 g. of cocoa.
inner: Clear soup, 250 c.c.; haddock, 174 g.; butter, 20 g.; ese, 42 g.; coffee, 250 c.c.; milk, 100 c.c.

he eggs were chosen of the same size. The same cheese, malade, and jelly were used throughout. The ingredients he rice pudding were weighed every time. The soup was le in exactly the same way each day.
f these foods parts equal to those eaten were taken and, r mincing when necessary, the whole mixed and analysed. analysis gave:—

	Grammes.			Calculated calories.
	Protein.	Carbohydrate.	Fat.	
rmined	98	117	169	2461
mated from tables	112	106	153	2302

ie value of the diet as estimated from analyses of cooked s is placed beneath for comparison. With the above a loaf of bread, weighing about a pound, was eaten r. When the bread was added the diet gave just under calories per day, or about 65 calories per kilogramme for ubject. Of this total food value about 38 per cent. was e form of bread.
e bread was prepared as follows. The day before an riment began 26⅔ oz. of the white floor used was weighed nd mixed with 13½ oz. of the meal or flour to be tested, g 2½ lb. of the mixed flour. This was then made into l with yeast as described in Chapter IX. of "Food and to Save It,"[2] the dough being divided into three equal s. As each experiment lasted three days the whole of our weighed out was consumed.
e white flour used was a pre-war white Canadian spring ; the oatmeal was described as fine Scotch oatmeal; arley flour and the maize were supplied by Messrs. han, of Aberdeen, and are described as finest sifted r flour and finest sifted maize flour respectively.
e war flour tested for comparison was obtained through indness of Mr. Oscar Andrews, of Belfast. It is a re of 80 per cent. wheat flour, 10 per cent. maize flour, 0 per cent. barley flour; the wheat flour being 83 per of the wheat, the maize flour 80 per cent. of the maize, he barley flour 65 per cent. of the barley.
white and war bread resembled each other in taste, being crusty appetising loaves. The oatmeal and bread were also good, and the rice bread was very ndeed. The maize bread was heavy but had an ble taste, and the heaviness did not made it un- ble. It may be mentioned here that similar oatmeal has been eaten for some months by a number of under the observation of one of us.

Details of the Experiment.

he analyses were done by A. B. Weir. Each figure mean of at least two concordant results. The carbo- e was determined gravimetrically after hydrolysis with sulphuric acid in an autoclave at 115° C. for one hour. her analytical methods were as described in a former

ysis of the flours used gave the following figures:—

	Protain per cent.	Carbohydrate per cent.	Ether extract per cent.
ite flour ...	13·0	80·5	2·4
meal	12·5	74·1	7·3
ley flour ...	8·1	83·0	1·7
ize meal ...	8·7	82·5	4·2
e flour ...	7·9	84·7	0·5
r flour ...	10·9	81·7	2·1

these figures the amount and composition of the ken as bread in each mixture of two-thirds wheat d one-third oatmeal, barley flour, maize meal, or rice ily calculated. It was thought better to estimate d value of the total flour used than to analyse the hus escaping the difficulty of being sure of getting proportionate parts of crust and crumb. A little of the food value of the flour is lost by fermentation to alcohol, how much we do not know; but it is only a small quantity and should be approximately the same in each experiment. The amount of yeast used was constant.
The subject of the experiment was a healthy young man of 9 st. 10 lb. (61·7 kilogrammes). He was working for 7 to 8 hours a day, and took exercise out of doors about two hours a day, walking, bicycling, and fishing. He had no indigestion, the appetite was good, and the bowels were open naturally every day.
The fæces corresponding to each kind of bread were separated by charcoal, which was taken at 6.45 A.M., at the beginning and end of each three-day period. it passed through the body in from 24 to 48 hours, a normal time. The total urine was collected and the nitrogen determined in order to ensure that no great variations in nitrogenous equilibrium took place.
In determining how much of the food material is lost in the fæces certain assumptions are made which, though not strictly true, do not invalidate the results of experiments done under conditions as far as possible identical. First, it is assumed that the ether extract of both foods and fæces is fat. Secondly, the nitrogen of the food and fæces is represented as equivalent to a corresponding amount of average protein. Thirdly, the nitrogen in the fæces is regarded as unassimilated nitrogen from the food, whereas a good part of it is contained in material cast off from the lining of the intestine, which may, however, be supposed to be fairly constant in health from day to day.

Results.

The following table gives the results obtained from each three days' experiment, expressed as grammes per day:—

Totals per Day (in Grammes).

	Nitrogen.	Carbohydrate.	Fat.	Calories.
White bread—				
Food taken	23·5	420·6	178·1	3987
Fæces	2·1	1·5	10·8	164
Food assimilated...	21·4	419·1	167·3	3823
Oatmeal bread—				
Food taken	23·4	412·5	184·4	4011
Fæces	2·9	3·7	10·8	184
Food assimilated...	20·5	408·8	173·6	3827
Barley-meal bread—				
Food taken	20·9	423·7	177·3	3961
Fæces	3·8	2·9	9·4	196
Food assimilated...	17·1	420·8	167·9	3765
Maize bread—				
Food taken	21·0	423·1	180·4	3997
Fæces	2·8	5·7	8·6	178
Food assimilated...	18·2	417·4	171·8	3819
Rice bread—				
Food taken	22·4	425·9	175·8	3965
Fæces	2·3	2·7	7·7	142
Food assimilated...	20·1	423·2	168·1	3823
War bread—				
Food taken	22·2	424·2	177·0	3965
Fæces	2·5	4·4	7·7	154
Food assimilated...	19·7	419·8	169·3	3811

The results can be compared more easily when expressed as the percentage of the total food taken which was assimilated in each experiment.

Percentage Assimilated.

	Nitrogen.	Carbohydrate.	Fat.	Calories.
White bread	91·0	99·6	93·9	95·9
Oatmeal bread	87·6	99·1	94·1	95·6
Barley bread	81·5	99·4	94·4	95·0
Maize bread	86·7	98·6	95·2	95·5
Rice bread	89·7	99·4	95·6	96·3
War bread	88·8	99·0	95·6	96·1

These figures show certain differences in the percentage absorption of nitrogen (or protein), which varied from 81 per cent. in the case of barley bread to round about 90 per cent. in the cases of white bread, rice bread, and war bread. The variations in the absorption of carbohydrate and fat are smaller; but it is remarkable that they appear to neutralise the effects of the nitrogen variations, for when the proportions of the total food values assimilated in each experiment are compared, as shown in the last column of the above table, they are seen to be almost identical, the lowest being 95 per cent. and the highest 96·3 per cent.
The percentage of food absorbed therefore in these six experiments, each with a different kind of bread, was almost

the same. The variation from the mean was less than 1 per cent.

As regards the effect on the bowels, part of the charcoal taken at 6.45 A.M. appeared the next morning in each case, and the rest was passed out the morning after, except in the rice experiment, when the final charcoal took two days to appear. In the case of oatmeal bread, rice bread, and war bread, the part containing the first charcoal was rather less solid. During all the rest of the experiment the fæces were formed and moderately hard.

Conclusions.

1. If properly prepared and baked, palatable breads can be made from a mixture of one-third of oatmeal, barley flour, maize flour, or rice flour, and two-thirds of wheat flour.

2. Experiment showed that each of these breads, when taken with a mixed diet, was, for the time of the observation and for this subject, as nourishing as the bread made from white wheaten flour.

PARIS.

(FROM OUR OWN CORRESPONDENT.)

The Control of Typhoid Fever in the French Army.

RECENT statistics illustrate the progress made during the war in dealing with typhoid fever, and establish the excellent results obtained by the use of antityphoid vaccination. The figures for the first three months of the war, which are probably very incomplete, give 8191 cases with 3076 deaths—i.e., a mortality of 37 5 per cent.—the census of cases being certainly far short of the truth, taken as it was during a period of disorganisation. Later statistics doubtless give a truer idea of the facts. During the period Nov. 1st, 1914, to Oct. 31st, 1915, 87.618 cases with 8614 deaths were recorded; from Nov. 1st, 1915, to Oct. 31st, 1916, 17,656 cases with only 700 deaths. The frequency of typhoid was therefore five and a half times less during the second year of war than during the first, and the mortality more than twelve times less. These results are manifestly due to the general adoption of vaccination, which was not made compulsory in the army until March 28th, 1914, only some 125,000 men having been rendered immune by the fateful day of mobilisation, August 2nd. The first vaccine used immunised solely against Eberth's bacillus and it was not until later that vaccines were introduced against paratyphoid infection A and B, the significance of which was only slowly recognised. At the present moment the immunity due to vaccination is beginning to decline, and in view of the appearance of new cases among inoculated men the Service de Santé has recently decided to proceed to general revaccination. By the study of the statistics in periods of six months certain illuminating conclusions will be apparent. The first period, ending on April 30th, 1915, naturally shows the highest figures—viz., 58,014 cases with 7013 deaths, that is, a case-mortality of 15·3 per cent. From May 1st to Oct. 30th, 1915, vaccination having become more general and the provision of drinking water more abundant, the number of cases fell to 29 604 and of deaths to 1151, the case-mortality being thus 3·9 per cent. Compared with the first half-year, the frequency of typhoid has been reduced by more than one-half, while the mortality per 1000 men is seven times less. Vaccination against paratyphoid was then adopted and in the next following six months the frequency fell to 12,043 and the number of deaths to 302; from May 1st to Oct. 30th, 1916, the frequency was still further reduced, becoming almost negligible in May and June. Finally, from Nov. 1st, 1916, to Sept. 1st, 1917, the reduction continued; during these ten months there were only 2048 cases and 129 deaths. The number of vaccinations required to produce this result should be noted. The central laboratory of Professor Vincent at the Val-de-Grâce Military Hospital furnished 5.513,073 doses of vaccine. To gain an idea of the benefit resulting from this enormous labour it is calculated that if the frequency and mortality of typhoid had remained what they were at the end of 1914, the number of cases of typhoid fever would have exceeded a million, and the number of resulting deaths 145,000, leaving out of account the probable aggravation of the disease caused by long-continued fighting and by three hot summers. No less convincing is a comparison of the sanitary condition of the French Army before the war according to the latest official figures (1911): the cases of typhoid and paratyphoid occurring in the armies at the front are now seven times less numerous, and the deaths eight and a half times fewer than in time of peace.

Iodide of Starch as an Antiseptic.

M. Auguste Lumière, of Lyons, has recently made interesting experiments with a new antiseptic which is said to be as powerful and as harmless for purposes of irrigation as Dakin's fluid. Iodide of starch is prepared by mixing in a litre of boiling water 25 gm. of soluble starch and 50 c.c. of a 1 : 1000 solution of iodine in potassium iodide. This fluid, which contains in the litre 50 cgm. of iodine in a state of extreme division, is not irritating to the integuments, and has no effect on the linen or bedding. It is used in the same manner as Dakin's fluid, to which its antiseptic power is equal, while it is a much simpler preparation.

The Suppression of Iodism by Adrenalin.

Dr. Milian has succeeded in avoiding the unpleasant effects such as lacrymation, conjunctivitis, œdema of the lids, swelling of the face, and salivation, produced in many patients by the administration of potassium iodide. For this purpose he employs adrenalin, in a dose of 6 mgr. a day, in two doses. In several patients who showed complete iodide intolerance the symptoms disappeared in 24 hours and it was possible to continue treatment without provoking them afresh. He has used the same method to combat the reactions provoked by arsenobenzol.

CANADA.

(FROM OUR OWN CORRESPONDENT.)

Annual Meeting of Canadian Public Health Association.

The Prevalence of Venereal Diseases.—An outstanding discussion at the annual meeting of the Canadian Public Health Association, held in Ottawa on Sept. 27th and 28th, was opened by Captain Gordon Bates, C.A.M.C., Toronto, with a paper prepared in collaboration with Captain Morris McPhedran, C.A.M.C., and Captain Donald Fraser, C.A.M.C., upon the incidence of venereal disease. They contrasted the efficiency with which this menace is dealt with in the Army and the comparative indifference of civic authorities, pointing to the periodical inspection in the former, and the possibility of quarantine, a trustworthy weapon not to be obtained in civilian life. The paper outlined a recent investigation extending over four months, in which 417 cases were analysed, showing that 70 infected men were under 20 years of age, 144 between 20 and 25 years, some 260 being single men and 36 married. In 127 cases of infection there had been no payment of money to the woman, and only 44 women were classed as professional prostitutes. In the majority of the cases the women were working in poorly-paid occupations, such as domestics, sales-women, waitresses, and theatre ushers. In 256 cases the influence of alcohol was denied, and in 97 cases either the man or woman, or both, had indulged to excess. In 60 cases the infection took place in the girl's boarding-house, while in 119 cases infection took place out-of-doors. Emphasis was placed on the alarming prevalence of these diseases in almost every community in Canada; gonorrhœa was responsible for 10 per cent. of the blindness of the Dominion, many surgical operations were rendered necessary through it; many chronic diseases were caused by it. Syphilis was the cause of 35 per cent. of insanity in the country, while it was also one of the causes of mentally defective children. Diseases of the heart and blood-vessels were common sequelæ. Dr. Bates strongly urged that steps be taken immediately to facilitate early diagnosis and prompt treatment of all cases. Clinics, he said, should be established, not only in the large cities, but all over the country; treatment must not be prematurely discontinued; and early marriages, which often result in the innocent infection, must be safeguarded. Venereal diseases should be quarantined, and a law passed in Canada similar to that of Western Australia.

Immigration problems.—The first morning session of the eting was given over to a discussion on the various eases which the Army Medical Corps had to contend with all branches of Army life. The President of the Associa-n, Dr. J. D. Page, medical officer, Immigration Hospital, ebec City, dealt principally with the immigration oblems of Canada as compared with those of the United ates. He spoke of the more effective system in vogue in United States of holding responsible for the class of migrants brought to the country the steamship com-ies, whose proprietors were fined without discrimination. Canadian Government, he said, should recognise the essity of a Public Health Department, but they would y do so when public opinion proved strong enough to ig about the desired result, and the Canadian people l seemed to be very indifferent about public health ters, as was evidenced by the small audiences which nded any public health gathering. The present was the e to prepare for the immigration problems which would e themselves upon Canada stronger than ever after the e of the war.

Patent medicines and alcohol "medicines."—Dr. Charles . O. Hastings, medical officer of health of Toronto, said many "cures" on the market contained an excess of gs and alcohol, the latter particularly since prohibition gone into effect in most of the provinces of Canada. The umption and cancer "cures" which were being sold were ing the victims of the only chance they had of recovery. manufacturers of such concoctions were criminals of the t type. He advocated health insurance for Canada on plan adopted in England, and demanded that the adian Government should take immediate action.

Child Hygiene.—Dr. Alan Brown (Toronto), in charge of Child Hygiene Department of the Toronto Board of th, read a paper deploring the fact that Canadian ers did not do their duty in respect to maternal nursing. quoted statistics to prove that the women of the United s and many foreign women were 50 per cent. ahead of dian women in that respect. He considered that the had not yet shouldered its responsibility in this d. He pointed to the awakening of European countries the war and stated the British infant mortality had been reduced since 1915 by about 10 per cent. king of the beneficial effects of milk depôts and s, he pointed out that if such work was to be effective a national standpoint, a milk depôt should be estab-l for every 20,000 inhabitants.

The Need for Caution in Medical Journals.

ough the Assistant Director of Medical Services in ary District No. 2 (Toronto) the attention of those rned has been called to a breach of military etiquette has occurred. Heretofore, articles on medical and al topics connected with the war have been appearing ne of our medical journals. The medical officers who e authors of these papers have apparently been over-g the fact that, not only by the King's regulations and for the Army, but also by special orders issued by the Expeditionary Forces, of which the Canadian Expe-ary Force is a part, they are forbidden to communicate apers without securing in advance consent for publi-from the Director-General of Medical Services. In all articles on medical or surgical subjects connected he war must be submitted to that official.

Canadian Medical Officers for the War.

er the selective draft system of the Canadian Military e Act (1917) Canadian doctors of military age will be l into three classes according to their physical fitness: A, who would go overseas; Class B, who would be for duty probably in England or at one of the an camps; and Class C, who would serve on the of hospitals in Canada. Forty-eight years was the e age-limit for home service, and 45 years for service s. Physicians over age might be attached to an military hospitals as consultants. Recently the of Physicians and Surgeons of Ontario appointed a committee to take a census of the medical men in the e. This requires the names of all medical men, r of military age or not. The register of Ontario s the names of about 3100 physicians, and over 500 e are overseas or in service at home.

"Audi alteram partem."

THE DISTRIBUTION OF BLOOD IN TRAUMATIC SHOCK.

To the Editor of THE LANCET.

SIR,—At the present moment much attention is being paid to the study of traumatic shock. It has been commonly stated and apparently accepted by many that this condition is in some way connected with an accumulation of blood in the capacious splanchnic area. The acceptance of this conception has considerably affected the views of some workers on this question, and has probably influenced to some degree the attempts that have been made to elucidate the problem.

A statement of a considerable clinical experience may conceivably be of use at the present moment. We would, therefore, state that in the course of many hundreds of abdominal operations undertaken upon patients in all degrees of traumatic shock we have not found any primary splanchnic congestion to exist. When the abdominal contents have been exposed to an atmosphere for any prolonged period, or when inflammatory processes have been established, a secondary vascular dilatation exists, but we can see no ground for the assertion that a primary dilatation of blood-vessels in the splanchnic area occurs.

We are, Sir, yours faithfully,

CUTHBERT WALLACE,
JOHN FRASER,
Oct. 1st, 1917. HAMILTON DRUMMOND.

THE GERMICIDAL POWER OF FLAVINE.

To the Editor of THE LANCET.

SIR,—Commenting in your issue of Oct. 20th on my note on the germicidal potency of flavine, Dr. C. H. Browning mentions that comparisons with other antiseptics are not given. As a matter of fact, such comparisons were made in some instances, with the following results:—

Experiment 1 (Inhibitory power of flavine on development of *B. perfringens* group in milk).

Carbolic acid 1:666 = No growth.	Bacterol 1:1600 = No growth.
,, ,, 1:1000 = Growth.	,, 1:2000 = ,,
	,, 1:2660 = Growth.

Experiment 2 (Germicidal power of flavine on *Staphylococcus* in broth).

Carbolic acid 1:133 = No growth. (Not carried lower.)	Kerol 1:5000 = No growth.
	,, 1:10,000 = ,, (Not carried lower.)

Experiment 3 (Same as No. 2, substituting saline for broth).

Carbolic acid ... 1:133 = No growth.
,, ,, ... 1:200 = ,,
(Not carried lower.)

Experiment 6 (Pus).—Bacterol 1:200 = No growth (not carried lower).

Dr. Browning objects to the use of pus for disinfectant tests because: (1) it is inconstant in composition and the results obtained with it vary enormously, and (2) the surgeon does not treat infected wounds by mixing an antiseptic with the pus contained in them. Since my note was published I have tested another staphylococcic pus. Results:—

Flavine 1:500 = No growth.	Flavine 1:1000 = Growth.

My two experiments with pus indicate that flavine 1:1000 does not kill; Fleming states that the germicidal power of flavine on staphylococcic pus lies between 1:500 and 1:1000. Here, at any rate, are several fairly concordant experiments. With regard to Dr. Browning's second point, I might equally say that the surgeon does not use his antiseptic mixed with peptone water or serum—the media employed by Dr. Browning in his experiments. The fact is, of course, that any medium used is a compromise, and does not exactly reproduce the conditions obtaining in an infected wound. On the whole I should be inclined to place most reliance upon results obtained with pus, if possible taking a mean value for a number of tests.

I am, Sir, yours faithfully,

Chandos-street, Strand, Nov. 6th, 1917. R. TANNER HEWLETT.

NASO-PHARYNGEAL INFECTION AT THE ONSET OF CEREBRO-SPINAL FEVER.

To the Editor of THE LANCET.

SIR,—In an interesting communication to THE LANCET of Oct. 20th, in which they record the fact that of 26 men who subsequently developed cerebro-spinal fever all gave a negative naso-pharyngeal swab when examined from 2–65 days before the onset of the disease, Staff-Surgeon P. Fildes and Surgeon S. L. Baker express the opinion that this observation is not in harmony with a previous statement of mine upon this subject. This I venture to point out is a misunderstanding.

In summarising the observations which had been made by Captain M. W. Flack when acting as officer in charge of the London District Cerebro-spinal Laboratory, in the report to the Medical Research Committee to which they refer, I drew attention to the particularly careful investigation made by him of cases at the onset of the disease, and remarked that his detection of the meningococcus in the naso-pharynx of the patient at the onset of symptoms in practically all his cases—including instances where at this early stage of the attack the meningococcus was not to be obtained from the cerebro-spinal fluid—went to show that every case of cerebro-spinal fever was in reality an instance of a carrier developing the disease. By this I never meant it to be understood that the carrying of the meningococcus by the patient in his naso-pharynx had been of a *chronic* nature. Contrariwise, the evidence in Captain Flack's and Captain Tulloch's reports in the same volume, and the general experience, both before and since, in outbreaks among the military, is to the effect that it is comparatively rare for chronic carriers to develop the disease themselves.

The fact recorded by Staff-Surgeon Fildes and Surgeon Baker, so far from contravening the view I took, and take, of this matter, is what I have always suspected to be the case in, at any rate, a considerable proportion of those who contract the disease.—I am, Sir, yours faithfully,

Central C.S.F. Laboratory, Caxton-street, S.W., Oct. 20th, 1917. M. H. GORDON, Lieutenant-Colonel, R.A.M.C.

THE BIOLOGICAL ASPECTS OF WARFARE.

To the Editor of THE LANCET.

SIR,—Dr. Harry Campbell's articles on this subject in recent issues of THE LANCET are, as his articles are usually, in keeping with the best thought of our day, but he and others have considered too little the biological aspect of the present war. A valuable book by Dr. Chalmers Mitchell on Evolution and the War was published in 1915, and there was a short correspondence last autumn in the *Saturday Review* on Biological Necessity, as it presented itself to the German mind. But except for these I have seen little reference to the unscientific claim of German scientists that the war which the Germans forced upon the world was a matter of biological necessity, based upon the assumption that their particular empire must expand. This audacious claim of the professors is silent now, but it lies at the very root of the causes of the war. Now, either these State-paid men, learned more than wise, have badly learned their Darwinism, or they are more treacherous than their European colleagues were wont to think in pre-war times. I prefer to think that Prussian ignorance of the mind of the world around them has led to this claim, and that the crafty advisers of the Kaiser have availed themselves of the simplicity of tame professors. The plea of necessity is good enough for tyrants, but in the kingdom of nature there exists no necessity that one group of animals in their efforts to expand should trample down other groups. The struggle for food and mates is not between Carnivores and Ungulates, between Felidæ and Ursidæ, or Bovidæ and Equidæ, but between individuals of the same species, all the great groups living side by side in a state of armed neutrality. Pithecanthropus may be superseded by Eoanthropus, and Neanderthal man by modern man, during a whole geological period, and the Aztecs and Incas be overwhelmed in a few years by a handful of Spaniards; but such events afford not the slightest parallel to the biological necessity claimed by Germany. Though the Felidæ be at once the strongest, fiercest, and most cunning of the Carnivores they fo their existence depends on keeping to their habitat, a even in their own family circle the lions and leopards ha not crushed out the panthers and lynxes. But our Felide Europe set up some loud-voiced Treitschke, and on h authority declare to the world that now, and precisely 1914 of the Christian era, the time has come for them succeed where Charlemagne, Spain, and France failed; th Germanism shall now prevail—because it must! The answ of thirteen hundred millions of men to this claim of som hundred and fifty millions can surely be only that of Natur "not a word and a blow, but a blow alone." Indeed, t rest of the civilised world does not see the necessity that German Empire, as such, should exist at all.

I am, Sir, yours faithfully,

Nov. 4th, 1917. WALTER KIDD, M.D., F.R.S.E.

THE TREATMENT OF ENURESIS.

To the Editor of THE LANCET.

SIR,—Gradual dilatation of the bladder can usually effected in a much simpler manner than by using catheter. When the child wishes to micturate make it hold its water while sitting quietly in a chair. It may be at first only able to hold it for half a minute, but in two or three weeks the child can often do so for ten minutes. It means, of course, a great deal of trouble for the mother or nurse, but it saves all the objections to passing a catheter some what frequently, and will get the bladder accustomed to a full charge. I am, Sir, yours faithfully,

Ingatestone, Oct. 31st, 1917. SHEFFIELD NEAVE.

To the Editor of THE LANCET.

SIR,—The reference to a surgical method of treatment of enuresis tempts me to refer to a medical method which is not so well known, I think, as it might be. Dr. Edmund Cautley mentions that "mere change of surroundings, such as admission to a hospital ward, is sometimes sufficient to break the habit." The habit may also very frequently be broken by the administration of sulphonal. I give a dose of sulphonal, containing about 1 grain for each year of the child's life, every night for the first week, every other night for the second week, and every third night for the third week. In a considerable number of cases the child is permanently cured. There may be some return a few weeks or months later, when the treatment can be successfully repeated. In some cases in which administration of sulphonal is not successful, it has occurred to me that success might attend larger doses. Sulphonal, however, is a drug which one must use with caution. At one time I tried trional in its place, but the results were very disappointing.

I am, Sir, yours faithfully,

Norwich, Oct. 31st, 1917. THEODORE FISHER.

To the Editor of THE LANCET.

SIR,—The correspondence in your columns on the treatment of enuresis prompts me to point out that, so far as my personal experience is concerned, this condition, when not dependent on organic disease, is one of the most favourable for treatment by suggestion. As a rule hypnosis is not required and few treatments are necessary.

I am, Sir, yours faithfully,

Harley-street, W., Oct. 31st, 1917. E. L. ASH.

CARDIAC DIGITAL PERCUSSION.

To the Editor of THE LANCET.

SIR,—I have read with very great interest the articles in THE LANCET of Oct. 20th, by Dr. W. Gordon and Dr. C. E. W. Bell, on the above subject, and I entirely agree with them as to the striking changes produced in digital cardiac dullness by change of posture from erect to recumbent. There is no doubt that the importance of percussion in the correct diagnosis of various cardiac conditions is not fully appreciated. It is not possible, in my opinion, to make a correct diagnosis of the state of a heart without the use of careful cardiac percussion, and if this percussion is only done in the recumbent position, it is equally impossible to arrive at a correct diagnosis as to the presence and degree of cardiac enlargement, especially enlargement due to dilatation of the auricles. Personally I always rely upon the deep cardiac dullness, as what is termed the "apex

al cardiac dullness" is variable and difficult to map out rectly, and therefore, as the authors of the article mention, no practical use. What is known as the "normal" diac dullness varies in almost every individual according he shape of the chest and the condition of the lungs; sequently every patient with a normal heart has a normal liac dullness of his own, though that dullness is always hin certain limits. When a patient is in the recumbent tion the area of cardiac dullness is decidedly reduced, as pared to that of the erect position, especially toward the t side; and it is therefore impossible to diagnose slight cular dilatation if the patient is only percussed in the ie position. This I believe to be the reason it is often looked. There is also no doubt, as the authors of the er state, that many medical men use faulty methods ercussion, and I fear this condition of things will rather ease than decrease as students are often taught to rely rely upon the polygraph or electrocardiograph and the ioscope for diagnostic purposes.

n more than one occasion I have drawn attention to the that medical men who attempt to make a full and rate diagnosis of a cardiac case entirely upon evidence ined by the aid of the electrocardiograph or the poly- h and the stethoscope, will fail to do so. The doctor wishes to make as accurate a diagnosis as possible must the polygraph, the sphygmomanometer, and the stetho-e, and must also percuss the heart out carefully, both in rect and prone position; if he fails to use one or more hese aids to diagnosis he will probably fail in his nosis.

I am, Sir, yours faithfully,

ley-street, W., Oct. 20th, 1917. LESLIE THORNE THORNE.

CESS AND FAILURE IN THE TREATMENT OF TUBERCULOSIS.

To the Editor of THE LANCET.

,—You are wrong in including me amongst those who only realised that the anti-tuberculosis methods were quate since the publication of the figures for 1916. In aper, "The Prevention and Treatment of Pulmonary rculosis," published in the *British Medical Journal* 12, I quoted Karl Pearson's statistical conclusions, n showed the steady retardation in the fall of the culosis death-rate since 1895. Professor Pearson kindly ht his diagrams up to 1915 for my book, "Pulmonary rculosis," published early this year, which confirmed evious conclusions.

am sure the general mechanism of the Edinburgh ne is sound enough, but I can no more think that it can ccessful without an efficient method of treatment than think a steam-engine of any use without steam.

I am, Sir, yours faithfully,

lin, Oct. 30th, 1917. W. M. CROFTON.

Dr. Crofton's letter placed him among those who saw present increased incidence of tuberculosis evidence lure in our anti-tuberculosis methods, but we expressed inion as to how long he had held this view.—ED. L.

WAR DEAFNESSES.

To the Editor of THE LANCET.

—In the current number of the *Journal of Laryngology, logy, and Otology* there is an article by Dr. W. Sohier t, a well-known New York oto-laryngologist at present g with the French Army, on "The Prevalence of Ear es and Diseases in the French Army," which merits the s attention of the British Army medical authorities. lling to the writer's experience the total number of n the evacuation hospitals of the *zone des armées* com- no fewer than 16 per cent. of ear cases, a number to, or greater than, the figure for ophthalmic disease. lition to these numbers, which naturally only include men who report sick, there are, it is estimated, still ning at the front at any period an equal number of who bear the loss of their hearing without complaint, s such cases as are severely wounded in other regions, whom on this account the ear injury is overlooked. ould be noted that while war injuries of the labyrinth ficult of treatment and of cure, such injuries as simple e of the tympanic membrane are easily and success- reated when promptly taken in hand by an expert. On the other hand, neglect or delay in attending to this inherently trifling injury entails the onset of suppuration of the middle ear with all its evil consequences. The fact is, as Dr. Bryant notes, that modern war exercises its evil influence more on the hearing organ than on any other special sense, and for that reason, therefore, modern armies ought to be equipped with a sufficient body of specialists to cope with this unlooked-for development. Unfortunately, this does not seem yet to be the case, for, as he says, with the English-speaking allies, the organisation of the special service of oto-rhino-laryngology is still very weak, and thus many men must be lost both to the Army and to civil life who might otherwise be saved.—I am, Sir, yours faithfully,

Wimpole-street, W., Oct. 27th, 1917. DAN MCKENZIE.

A METHOD OF COLLECTING BLOOD SERUM.

To the Editor of THE LANCET.

SIR,—There is a simple and efficacious method of obtaining serum from blood which I have not seen referred to in the articles dealing with this matter in THE LANCET, and which in the absence of special apparatus can be easily carried out.

The blood is collected or run into a test-tube of ordinary size, 15 by 1·5 cm., to the amount of 2 or 3 c.c.; it is then allowed to clot in a sloping position. The sloped blood should extend as far along the side of the tube as possible so as to form a thin layer, and the tube should not be moved until the clot is firm, an hour or more, according to the temperature and other factors. The serum will sweat out in drops during the course of a few hours and run to the bottom of the tube, the clot finally drying down on the glass into a thin skin.

As a matter of laboratory routine where small amounts of blood are collected, as for the Wassermann reaction, and kept stored for a day or two before the test is carried out, this forms a most convenient method. It was shown me a year or two ago by Captain A. H. W. Caulfeild, C.A.M.C., and I have seldom known it fail to give a good supply of clear serum. My experience of blood sent by post in stout glass tubes, 12 × 1 cm., with rubber bungs, is that it arrives with a firm detached clot and an abundance of serum, which on standing a short time becomes perfectly clear. Presumably the shaking aids the detachment and shrinking of the clot in this case.—I am, Sir, yours faithfully,

T. H. C. BENIANS.

Prince of Wales's Hospital, Tottenham, N., Oct. 31st, 1917.

THE POSITION OF PRACTICE UNDER THE NATIONAL INSURANCE ACT.

To the Editor of THE LANCET.

SIR,—The leading article in THE LANCET of Oct. 27th with this title was interesting reading. Despite all the pros and cons. I do not think that the Act has been a blessing to a majority of medical men on the panel. The great mistake has been made of giving our prescriptions to pharmaceutical chemists to use wholesale for their own benefit in prescribing over the counter. Formerly a medical man would charge from 2*s.* 6*d.* to 5*s.* (and more) for a prescription; now one panel patient can have for 5*s.* 6*d.* a year half a dozen prescriptions. This is a state of things which those of our parents, who, being in medical practice, spent a lot of money at the London hospitals for our training in their profession, could never have dreamed of. Last winter I was called to see a lad with a severe cough and cold, and this lad's uncle informed me he got a cough mixture from the chemist. On seeing the mixture I found it to be the prescription I give to my panel patients. Cases where pharmaceutical chemists have prescribed for the public, and by so doing have caused the proper time for scientific interference to be fatally put off, are known to all of us.—I am, Sir, yours faithfully,

Cheltenham, Oct. 29th, 1917. ARTHUR E. PRICE.

THE governors of the West Ham Municipal Central Secondary School propose to call the institution "The Lister School," to perpetuate the association of Lister with the borough.

THE University of Leeds has received with great regret the resignation by Professor A. S. Leyton of the Chair of Pathology and Bacteriology in the University, and has recorded its high appreciation of the valuable services rendered by him during his tenure of the chair.

Obituary.

SIR DAVID CALDWELL McVAIL, M.B., F.F.P.S. GLASG., HON. F.R.C.P. IREL.,

CONSULTING PHYSICIAN TO GLASGOW ROYAL INFIRMARY; LATE CROWN MEMBER FOR SCOTLAND OF THE GENERAL MEDICAL COUNCIL.

WE learn with regret of the death at his house in St. James's-terrace, Glasgow, on Sunday last, of Sir David Caldwell McVail, his illness, acute pneumonia, only having extended over two days.

David Caldwell McVail was born in Kilmarnock 72 years ago and received his education at Kilmarnock Academy. Deciding to enter the medical profession, after a brief period of apprenticeship to a druggist, he proceeded to Anderson's College, Glasgow, and later became an undergraduate at the University. He obtained the Licentiateship of the Royal Faculty and also of the Royal College of Physicians, Edinburgh, in 1866, graduating later in medicine at Glasgow University. On qualification he went into practice for a time in the country, but shortly returned to Glasgow, and in 1887, having been admitted in the meantime a Fellow of the Royal Faculty, took up the post of lecturer on physiology in Anderson's College. From this time forward he became a leader in medical circles in Glasgow, chiefly because of his wide interest in the reform of medical education and later in general university reform, but it must be remembered that he was also a sound and learned clinician. He was a protagonist in the movement which resulted in the passing of the present Scotch Universities Act, and was personally responsible for many of the prominent features of a piece of legislation whose result has been the foundation of chairs and lectureships and the general raising of the standards of teaching and examination in Scotland. After resigning the lectureship of physiology in Anderson's College he assisted in the founding of the Western Medical School, Glasgow, and held there the lectureship in the practice of medicine. He was appointed dispensary physician to the Western Infirmary, and later he became professor of clinical medicine in St. Mungo's College, and finally physician to the Royal Infirmary, Glasgow.

As a matter of course McVail was regarded by the Royal Faculty of Physicians and Surgeons of Glasgow as a typical representative of their interests and of the cause of medical education generally on the General Medical Council, and from 1886, when the new Medical Act came into existence, to 1888 he represented the Faculty at the Council board; but in 1892 he was appointed to the Council as Crown Representative for Scotland, a position which he held for 20 years by successive reappointments until 1912. His interest in the work of the Council was unflagging. As a member of the Executive Committee, of the Committees on the Pharmacopœia, on Public Health, and on the National Insurance Act, and as chairman of the Examination Committee, he made his strong and keen personality a prominent feature in all the deliberations of that body.

In 1910, in due recognition of distinguished public work, McVail received the honour of knighthood. He had been a member of the Glasgow University Court at the time of his death for nearly a quarter of a century, and since the outbreak of war has been regularly engaged in professional work at two of the Glasgow hospitals. His life may therefore be said to have been passed in promoting the progress and scientific interests of his calling, and he died with harness on his back.

Sir David McVail married the daughter of a prominent Newcastle journalist and is survived by his wife, one daughter, and one son, who is a surgeon in the Colonial Service in Singapore. He was succeeded on the General Medical Council by his brother, Dr. J. C. McVail, vice-chairman of the National Insurance Commissioners in Scotland.

THE LATE DR. EDMUND F. T. PRICE.—Dr. E. F. T. Price, of Edinburgh, who died suddenly on Oct. 27th while drilling with the Volunteers at Corstorphine, was son of the late Dr. A. G. Price, civil surgeon in the Indian Medical Service, and was educated in India, taking his degree at Edinburgh University. He had done much X ray work for the Red Cross during the war. Dr. Price leaves a widow, a daughter, and three sons, two of whom are on active service with the Royal Army Medical Corps.

THOMAS TILLYER WHIPHAM, M.A., M.D. OXON., F.R.C.P. LOND.,

CONSULTING PHYSICIAN TO ST. GEORGE'S HOSPITAL.

WE regret to announce the death, at his residence Fishleigh House, Hatherleigh, Devon, of Thomas Tillyer Whipham, consulting physician to St. George's Hospital and for many years in consulting practice in Grosvenor-street, London.

Thomas Tillyer Whipham was born in 1839, the son of a barrister of Lincoln's Inn, and was educated at Rugby, Oriel College, Oxford, and St. George's Hospital. At St. George's Hospital he held in succession all the medical teaching posts in the school, and was elected assistant physician in 1872. In 1877 he became full physician after an unusually short time of waiting for promotion, and he was for a considerable period dean of the medical school. No member of a hospital staff could have more endeared himself to students. He was the best type of teacher, courteous, impressive, clear, simple, but well equipped to his task ends. For years his demonstrations in clinical medicine were a feature in the training of the students at his hospital. He had charge especially of the throat department, and the notes of his experience in that capacity, published in the St. George's Hospital Reports, are those of a most careful clinician. In Volume VIII. of the same Reports will be found some interesting records from his pen of the early use of salicin and salicylic acid, and he contributed a few papers on laryngological topics to THE LANCET; but he wrote very little, and was only an infrequent speaker at the medical societies. He examined in medicine at Oxford and also at the English Conjoint Board, and served as Senior Censor to the Royal College of Physicians of London. He was also physician to the Legal and General Life Assurance Society and a member of the Court of Assistants of the Goldsmiths' Company. He was elected consulting physician to the hospital which he had served so well in 1897, and later retired from practice and went to live in the country, having always been a devoted adherent to county sport.

He married Florence, daughter of Mr. Charles Tanqueray, by whom he had one son, Dr. T. R. C. Whipham, physician to the Evelina Hospital for Children.

WALTER FOWLER, M.A., M.B., B.C. CANTAB., F.R.C.S. ENG., L.S.A. LOND.

THE death is announced at Bendigo, Australia, on July 26th, of Dr. Walter Fowler, at the age of 59. He was the son of the late Dr. Robert Fowler, of Bishopsgate-street and Old Burlington-street, London, and commenced his medical career by winning in 1876 the Tancred studentship in medicine, held at Gonville and Caius College, Cambridge. After graduating at Cambridge in Arts he proceeded to Guy's Hospital, from which medical school he qualified in 1883, afterwards holding the appointment of house surgeon. In 1884 he took the Fellowship of the Royal College of Surgeons of England, and in the following year commenced practice in Birmingham, being appointed surgical patient surgeon at the Queen's Hospital. On the death of his father in 1886 he returned to London to carry on the general practice in the City, holding an appointment also at the Central London Throat and Nose Hospital, where he assisted the late Mr. Lennox Browne. A breakdown in health led him to migrate to Australia, and after nine years' private practice in Echuca, Victoria, he was appointed resident medical officer to the Bendigo Hospital. Here his large surgical experience resulted in his becoming one of the leading surgeons of Victoria, and when ill-health forced him to retire in 1912 from the hospital, he was much missed as a kindly and efficient administrator.

In 1887 he married Alice M. Wacher, of Herne, Kent, who, with a family of two sons and one daughter, remain to mourn their loss.

ROYAL INSTITUTION.—A general meeting of the members of the Royal Institution was held on Nov. 5th, Sir James Crichton-Browne, the treasurer, being in the chair, when the special thanks of the members were voted to a lady member for an anonymous gift of £500 and to Richard Pearce for a donation of £100 to the Fund for Promotion of Experimental Research at Low Temperatures.

THE SERVICES.

ROYAL NAVAL MEDICAL SERVICE.

To be temporary Surgeons: A. McCallum, N. A. H. Barlow, M. H. Tupe, B. S. Collings, J. W. McK. Nicholl.

ARMY MEDICAL SERVICE.

Col. M. J. Sexton, C.B., is retained on the Active List under the provisions of Arts. 120 and 522, Royal Warrant for Pay and Promotion, and to be supernumerary.

TERRITORIAL FORCE.

Capt. (temp. Major) C. M. Fegen to be Deputy Assistant Director of Medical Services.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Col. J. C. Connor, C.M.G., relinquishes the rank of temporary Colonel on re-posting.

The undermentioned relinquish the acting rank of Lieutenant-Colonel on re-posting: Major C. H. Straton, Capt. H. Gibson.

The undermentioned Majors retain the acting rank of Lieutenant-Colonel whilst in command of a Casualty Clearing Station: T. F. Ritchie, D.S.O., E. W. Siberry.

Capt. J. B. A. Wigmore to be acting Lieutenant-Colonel whilst in command of a Field Ambulance.

Temp. Major D. A. Whitton, Can. A.M.C., to be acting Lieutenant-Colonel while specially employed.

Temporary Lieutenants to be temporary Captains: H. Gooch, . Turner, J. L. Lawry, E. M. Fannin, A. L. Saunders, S. Potter, W. G. Johnson, S. P. Bedson, A. Chance, C. W. Macpherson, T. H. artin, M. J. Wilson, H. A. Whyte-Venables, M. R. V. Ford, C. J. R. offmeister, W. Rowat, A. W. Kendall, S. F. Fouracre, W. H. Duncan, J. B. Leney, S. F. Cheesman, M. J. Loftus, D. MacKinnon, W. J. homas, G. A. Crowe, G. C. Hartley, A. P. Piggot, C. Duncan, Clapperton, J. Goeghegan, C. T. M. Plowright, W. McAlpine, H. J. mson, M. H. Laslett, H. Goodale, J. R. Anderson, S. H. Ryan, R. W. irn, S. A. Owen, T. B. Sellors, F. J. Spilsbury, D. C. P. Taylor, J. N. Longridge, A. L. Saunders, H. C. Burbidge, E. V. Dunkley, Anderson.

M. Fisher, late temporary Captain, is granted the honorary rank Captain

Temp. Lieut. J. M. Ahern, late Surgeon Captain, Liverpool Regiment, to be temporary Captain.

. B. Lilly, late temporary Captain, is granted the honorary rank Captain.

Officers relinquishing their commissions: Temp. Capts. W. S. Allan, Lindsay, M. Polson, I. B. D'Oher, H. V. Drew, A. G. Bodman, J. I. inson, A. McC. Davidson, W. M. Will, J. B. Wood, J. F. McCracken, A.M.C., C. W. Anderson, Can.A.M.C. Temp. Lieuts. J. Anderson, R. J. Scarr, G. Sporiti, G. Elam, J. H. Stephens, W. Dunn, J. C. on, R. W. S. Walker, S. Hutchinson, F. Rogerson, C. Murphy, J. C. rray, W. J. Morrish, A. B. Ferguson, T. W. Walker, A. Spong, E. Macvie, G. M. B. Liddle, W. B. Harris, C. M. Keillor, T. G. ton, A. Falconer.

SPECIAL RESERVE OF OFFICERS.

Lieutenants to be Captains: G. K. E. Inman, J. K. R. Landells.

To be Lieutenants: Temp. Hon. Lieut. E. S. Phillips (from R.A.M.C.), D. Mackinnon (from Edinburgh University O.T.C.), E. J. Coombe, Gerry, R. F. C. H. Buchanan.

TERRITORIAL FORCE.

Capt. (temp. Major) C. M. Fegen to be seconded whilst holding an appointment as Deputy Assistant Director of Medical Services.

Capt. (temp. Major) C. M. Fegen to relinquish his temporary rank on relinquishment in posting, and to be restored to the establishment.

Capt. (temp. Major) G. A. Ewart relinquishes his temporary rank on relinquishment in posting, and is restored to the establishment.

Capt. A. C. O. Brown relinquishes his commission on account of ill-health.

Capt. G. L. L. Lawson to be temporary Major whilst in command of a Field Ambulance.

Capt. A. L. Flemming to be restored to the establishment.

Capt. H. H. Markham to be seconded for duty with a General Hospital.

Capt. L. A. Rowden, M.C., to be seconded for service with a General Hospital.

Capt. J. Pearson to be seconded for duty with a General Hospital.

Capt. W. I. Cumberlidge to be seconded for duty with a General Hospital.

Lieut. J. R. Clark to be Captain.

O. Scott, 11th Battalion, West Riding Volunteer Regiment, to be Honorary Lieutenant and Medical Officer.

TERRITORIAL FORCE RESERVE.

Capt. (temp. Major) W. Tyson, from R.A.M.C., to be Captain.

Capt. A. G. Williams, from R.A.M.C., to be Captain.

Colonel Sir William Boog Leishman, C.B., F.R.S., M.P., has been appointed a Knight of Grace, and Major Thomas Houston and Major Charles William Menelaus Wilkie Esquires of the Order of the Hospital of St. John of Jerusalem in England.

At the annual meeting of the Society of Members of the Royal College of Surgeons of England held on Thursday, 30th inst. note was taken of the rejection by the College Council of the proposal made by the society not to hold this year the usual annual general meeting of Fellows and Members, in view of the fact that many of them are absent on war service or busily engaged at home. It was unanimously decided to submit no resolution at the College meeting in November and to make no attempt to attend the meeting or to obtain a quorum there.

The War.

THE CASUALTY LIST.

THE following names of medical officers appear among the casualties announced since our last issue:—

Killed.

Capt. E. J. Kerr, Australian A.M.C.

Major G. R. C. Clarke, Australian A.M.C., qualified at Sydney in 1902, and was in practice at Wahroonga, New South Wales, prior to joining the Expeditionary Force.

Died of Wounds.

Capt. A. Z. Philips, R.A.M.C., qualified at Edinburgh in 1910, and held appointments at the Royal Southern Hospital and at the Children's Infirmary, Liverpool, at the Scarborough Hospital and Dispensary, at the Park Hospital for Children, Hither Green, Lewisham, and at the Florence Fiennes Hospital, Dunkirk.

Capt. D. J. S. Stephen, M.C., R.A.M.C., qualified at Aberdeen in 1910, and held appointments at the County Hospital and at The Lawn Asylum, Lincoln. He was in practice at Lincoln before joining the R.A.M.C. The award of the Military Cross was recorded in THE LANCET of July 31st, 1915, p. 257.

Capt. W. G. McConnell, R.A.M.C., qualified in Ireland in 1915, and joined up shortly afterwards.

Capt. W. Morrison, M.C., R.A.M.C., qualified at Edinburgh in 1909, and shortly afterwards joined the West African Medical Service. The award of the Military Cross was recorded in THE LANCET of Dec. 2nd, 1916, p. 958.

Wounded.

Capt. S. R. Gleed, R.A.M.C., attached Durham L.I.
Lieut. A. P. Draper, R.A.M.C., attached Lancashire Fusiliers.
Capt. R. D. Nasmyth, R.A.M.C.
Major W. R. Craig, Australian A.M.C.
Capt. P. S. Parkinson, Australian A.M.C.
Capt. J. Arthur, R.A.M.C.
Lieut. G. E. Lloyd, M.C., R.A.M.C.
Capt. W. J. Nisbet, R.A.M.C.
Capt. R. W. Ryan, R.A.M.C.
Surg. R. G. Morgan, R.N.
Surg. J. N. McB. Ross, M.C., R.N.
Capt. P. MacCullum, M.C., R.A.M.C.
Capt. W. Steadman, R.A.M.C.
Capt. H. C. Watson, R.A.M.C.
Lieut. L. N. Morris, R.A.M.C.
Major T. J. Frizell, Australian A.M.C.
Major T. M. Furber, Australian A.M.C.
Major H. Buck, M.C., Canadian A.M.C.
Surg. W. P. Starforth, R.N.
Lieut. E. H. Good, R.A.M.C.
Capt. W. R. Addis, R.A.M.C.
Lieut.-Col. H. Fulton, R.A.M.C.
Capt. K. A. MacCuish, Canadian, A.M.C.

CASUALTIES AMONG THE SONS OF MEDICAL MEN.

The following additional casualties among the sons of medical men are reported:—

Second Lieut. H. G. Turrell, Oxford and Bucks L.I., died of wounds, only son of Dr. W. J. Turrell, Oxford.

Lieut. F. K. Holton, Middlesex Regiment, killed in action, only son of Dr. F. W. P. Holton, Barking-road, London.

MENTIONED IN DESPATCHES.

In a despatch from Simla, dated July 23rd, 1917, dealing with military operations in the Indian Empire from March 10th, 1916, to March 31st, 1917, the names of the following medical officers are mentioned:—

Major C. E. W. S. Fawcett, R.A.M.C.; Lieut. B. S. Dhondy, I.M.S.; Capt. J. B. Hanafin, I.M.S.; Major D. Heron, I.M.S.; Capt. M. A. Rahman, I.M.S.

FOREIGN DECORATIONS.

Japanese.

Order of the Sacred Treasure, 1st Class.—Surg.-Gen. Sir A. W. May, K.C.B., K.H.P.

French.

Croix de Guerre.—Fleet-Surg. J. R. Muir, R.N.; Staff-Surg. W. T. Haydon, R.N.; Surg. H. E. R. Stephens, R.N.; Surg. R. G. Lyster, R.N.; Surg. H. P. Margetts, R.N.

OBITUARY OF THE WAR.

ROBERT HAIG SPITTAL, M.B., CH.B. ABERD.,

CAPTAIN, ROYAL ARMY MEDICAL CORPS.

Captain R. H. Spittal, who was killed in action on Oct. 4th, was born at Ellon, Aberdeenshire, where his father was schoolmaster. Educated at Gordon's College, Aberdeen, and at Aberdeen University, where he obtained distinction in anatomy, he graduated M.B., Ch.B. in 1905. After a period as demonstrator of anatomy and as house surgeon at the Sick Children's Hospital, he left Aberdeen and settled in general practice first at Whaley Bridge, near Stockport, and then at Denton, joining Dr. John Murray in partnership at South Bank, Yorkshire, in 1912. On the outbreak of war he volunteered for service in the Royal Army Medical Corps, and was sent to Serbia, where he received the Order of St. Sara, 5th Class. After seeing service in Egypt and Malta, he was attached to a regiment in France, and remained there until his death. His partner writes of Captain Spittal as a man with a reserved manner, which did not prevent his kind and sympathetic nature becoming known to a wide circle of friends. He was a keen golfer.

ROBERT STERLING, M.A., M.B. DURH.,

CLERK IN HOLY ORDERS;
CAPTAIN, ROYAL ARMY MEDICAL CORPS.

Captain R. Sterling, who recently died in a nursing home in London, was ordained in 1884 and took his medical degree three years later. After serving in two curacies he went to Gaza in 1892 to take charge of the hospital belonging to the Church Missionary Society. He was there when Turkey declared war in 1914, and after being kept as a hostage for a while was sent home from Jerusalem at the end of the year. On reaching England he obtained a commission in the R.A.M.C. and was sent to Egypt, where he remained until the early part of this year, when he was invalided home with an internal malady from the effects of which he died. Captain Sterling took a deep interest in the future of the Holy Land and would have warmly welcomed the fall of Gaza. At El Arish he opened and maintained a school and a dispensary for the benefit of the villagers. His popularity at Gaza resulted in the presentation of a cheque from the leading Moslems of the town as a token of their gratitude. Captain Sterling was honorary canon of St. George's, Jerusalem.

BENJAMIN ALLEN BULL, L.M.S.S.A.,

CAPTAIN, ROYAL ARMY MEDICAL CORPS.

Captain B. A. Bull, who was killed in action on Sept. 16th at the age of 30 years, was only surviving son of Professor Bull, of Manchester. He was educated at Rydal Mount, Colwyn Bay, and at Jesus College, Oxford, obtaining first-class honours in Mathematical Moderations and a first class in the Final Honour School of Physiology. When war broke out he was a student at St. Bartholomew's Hospital. Offering his services to the Navy he acted for four months as surgeon probationer on the *Lysander*, returning to take his medical qualification in 1915. He then obtained a commission in the R.A.M.C. attached to a Home Counties Field Ambulance, and early this year went out to France with a battalion of the London Regiment. He was killed by a shell which burst outside his aid-post as he was tending a wounded man. Letters from fellow officers allude to Captain Bull's cheery spirit and devotion to duty; he had a gift of humour which was caustic without wounding, combined with a keen enjoyment of life. At Oxford he took a special interest in the problems of diabetes and read widely on the subject, so that his professor anticipated distinction for him if he had lived to follow up this work.

FREDERICK CHARLES DAVIES, M.A., M.B. CAMB., M.R.C.P.,

CAPTAIN, ROYAL ARMY MEDICAL CORPS.

Captain F. C. Davies, who was killed in action in France on Oct. 17th at the age of 33 years, was youngest son of William Davies, J.P., first mayor of Battersea. Educated at St. Paul's School, London, and Downing College, Cambridge, he completed his medical course at Charing Cross Hospital, qualifying in 1908 and holding house appointments there and at the West Ham Isolation Fever Hospital. In 1912 he became medical registrar to Charing Cross Hospital and later county tuberculosis officer for Cambridgeshire. He went to France early in August, 1914, was invalided home with typhoid fever a year later, and was then appointed registrar to a base hospital. Latterly he was attached as medical officer to the Northumberland Fusiliers, with whom he met his death.

A medical friend writes of Captain Davies: "He endeared himself to his friends by his engaging manner and kindly disposition. He was an indefatigable worker on any subject he was interested in, and there is no doubt that had he lived he would have attained a high position in his profession."

MEDICAL RE-EXAMINATION OF MEN FOR THE ARMY.

The Local Government Board have issued circulars addressed to local tribunals (R. 154) and appeal tribunals (R. 155) to guide them in regard to the medical re-examination of men who find themselves aggrieved by their grading under the new scheme of the Ministry of National Service. A six-page pamphlet of rules (R. 156) accompanies the circulars. Briefly, the rules provide that any man may apply to the Appeal Tribunal, within the stipulated time, against his grading by the National Service Medical Board, or, if he has applied to the board for a re-examination and been refused, against that refusal. If the Appeal Tribunal are satisfied that he has made out a sufficient case they may authorise him to be re-examined by their medical assessors.

MINISTRY OF NATIONAL SERVICE: ADVISORY BOARD FOR SCOTLAND.

The Minister of National Service has appointed an Advisory Medical Board for Scotland to assist him on matters relating to the examination of men of military age by the new medical boards, and the Secretary for Scotland will refer to the same board questions submitted by the medical assessors appointed by him. The members of the board are as follows:—Sir Donald Macalister, Dr. R. C. Buist, Dr. J. R. Fraser, Dr. John Gordon, Professor Harvey Littlejohn, Professor T. K. Monro, and Dr. John Playfair.

THE AUXILIARY R.A.M.C. FUND.—The committee announce that the following amounts have been received for these funds during the quarter ending Sept. 30th.

Benevolent Officers' Branch, £249 7*s.* 3*d.*
Relief Branch, Wt. O., N.C.O.'s, and men, £1067 7*s.* 3*d.*

THE TREATMENT OF DISABLED SOLDIERS IN WALES.

Sir A. Griffith-Boscawen stated in Parliament last week that the 176 institutions, including military, auxiliary, and civil hospitals and convalescent homes, were in use in Wales and Monmouthshire, and open to the treatment of discharged disabled soldiers, and the Joint Disablement Committees set up by the Local War Pensions Committees and the Ministry have been invited to submit proposals for meeting any deficiencies in this respect. Schemes for establishing an after-care colony with training for tuberculosis and one at least one centre for orthopædic treatment are under consideration. With regard to training, schemes have been sanctioned for cinema operating at Cardiff, cabinet-making and toy-making at Trefnant, horticulture and market gardening at Wrexham Garden Village. Diamond-cutting and polishing will, it is hoped, shortly established at Wrexham, and it is proposed to start a number of courses in various subjects at Cardiff. The western principality does not seem to lag behind in its care for the sick and disabled soldier.

URBAN VITAL STATISTICS.

(Week ended Nov. 3rd, 1917.)

English and Welsh Towns.—In the 96 English and Welsh towns, with an aggregate civil population estimated at nearly 17,000,000 persons, the annual rate of mortality was 12·6, against 12·0 per 1000 in each of the two preceding weeks. In London, with a population exceeding 4,000,000 persons, the death-rate was 13·0, or 0·2 per 1000 above that recorded in the previous week; among the remaining towns the rates ranged from 4·5 in Eastbourne, 5·2 in Carlisle, and in Hornsey, to 19·9 in Middlesbrough, 20·9 in Stockton-on-Tees, and 21·7 in Brighton. The principal epidemic diseases caused 291 deaths, which corresponded to an annual rate of 0·9 per 1000, and included 90 from infantile diarrhœa, 60 from diphtheria, 56 from measles, 43 from whooping-cough, 14 from scarlet fever, and 4 from enteric fever. The deaths from diarrhœa, which had declined from 278 to 121 in the three preceding weeks, further fell to 114, and included 35 in London, 10 in Liverpool, 6 in Birmingham, and 5 each in Leicester and Manchester. The 1189 cases of scarlet fever and 1409 of diphtheria under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital were respectively 95 and 52 above the numbers remaining at the end of the previous week. Of the deaths from all causes in the towns 153 resulted from violence. The causes of 34 deaths were not certified, of which 7 were registered in Birmingham and 4 each in Portsmouth, Liverpool, and Rochdale.

Scotch Towns.—In the 16 largest Scotch towns, with an aggregate population estimated at nearly 2,500,000 persons, the annual rate of mortality was 12·3, against 12·1 and 11·4 per 1000 in the two preceding weeks. The 255 deaths in Glasgow corresponded to an annual rate of 11·9 per 1000, and included 9 from diphtheria, 5 from whooping-cough, 4 each from measles and infantile diarrhœa, and 1 from scarlet fever. The 97 deaths in Edinburgh were equal to a rate of 15·2 per 1000, and included 3 each from whooping-cough and diphtheria and 1 from diarrhœa.

Irish Towns.—The 118 deaths in Dublin corresponded to an annual rate of 15·4, or 4·4 per 1000 in excess of that recorded in the previous week, and included 6 from infantile diarrhœa, 3 from measles, and 1 from diphtheria. The 94 deaths in Belfast were equal to a rate of 17·1 per 1000, and included 6 from infantile diarrhœa and 1 each from enteric fever, scarlet fever, and whooping-cough.

THE DISAPPEARANCE OF GLANDERS.—

A report of Birmingham corporation states that although possibly there may be some increase of glanders after the war, nevertheless, under the present regulations and modern efficacy in diagnosis, the final extermination of this dangerous disease will not probably be long deferred.

Medical News.

EXAMINING BOARD IN ENGLAND BY THE ROYAL COLLEGES OF PHYSICIANS OF LONDON AND SURGEONS OF ENGLAND.—At the Final Examination, held from Oct. 9th to 24th, the following candidates were successful in the subjects indicated:—

Medicine.—C. W. W. Armstrong, Guy's; K. E. Attenborough, St. Mary's; R. W. C. Ball, Middlesex; E. R. Batho, St. Bartholomew's; P. F. Bishop, Cambridge and St. Thomas's; J. C. Blake, University College; R. B. Britton, Bristol; Ellinor Marjorie Burnett, Royal Free; G. T. Calthrop, Cambridge and London; W. B. Christopherson, St. Bartholomew's; C. B. Cohen, Cambridge and St. Thomas's; W. Collins, Sheffield; B. S. Cornell, Toronto; T. L. Crawhall, Cambridge and Durham; J. K. Datta, Calcutta; A. R. Doyle, Guy's; F. N. V. Dyer, Cambridge and St. Thomas's; S. D. A. El Daab, Cairo and St. Bartholomew's; A. A. H. El Zeneiny, London; J. T. T. Forbes, W. Gover, and W. H. Grace, Guy's; A. S. Green, University College; N. B. de M. Greenstreet, Cambridge and St. Thomas's; W. S. Gross, Cambridge and St. George's; C. W. Hayward, University College; C. B. Henry, Westminster; A. G. Hewer, Middlesex; H. A. Hill, Birmingham; R. Hilliard, London; C. P. Hines, St. George's; E. A. Holmes, King's College; J. Hope, Manchester; H. B. Jackson, Cambridge and St. Bartholomew's; M. Jackson, St. Bartholomew's; D. M. Jones, London; J. W. Jones, Middlesex; G. S. L. Kemp, Sheffield; D. M. Lala, King's College; F. W. M. Lamb, Birmingham; A. W. Lewis and G. E. MacAlevey, St. Mary's; J. T. C. McAuslin, Edinburgh; Malati Madgavkar, Birmingham; G. Meadows, Guy's; Daisy Kathleen Fairbairn Michael, Madras and Charing Cross; H. Morrison, Cambridge and St. Bartholomew's; G. E. Mullins, Birmingham; P. M. Neighbour, Cambridge and St. George's; J. Nel, Charing Cross; Freda Newman, Durham; E. Nissim, University College; E. J. Papenfus, St. Thomas's; W. H. Parr, London; A. L. S. Payne, Guy's; H. T. Prys-Jones, Cardiff and St. Mary's; D. C. Rennie, Birmingham; R. T. F. D. Roberts, Guy's; Gwendolen Mary Rolfe, Royal Free; P. Rustim, Bombay; A. R. Sami, St. Thomas's; G. A. S. Shacklock, Guy's; B. B. Sharp, St. Bartholomew's; G. H. Sims, St. Thomas's; P. W. Symons, Middlesex; G. B. Tarring, Oxford and Guy's; Edith Marjorie Thom, Cardiff and Royal Free; N. B. Thomas, St. Bartholomew's; W. S. Tunbridge, Oxford and St. Bartholomew's; W. R. Tutt, Toronto; M. D. Vint, Cambridge and London; P. H. Williams, St. George's; S. A. Withers, Guy's; and S. T. Wong, Guy's.

Surgery.—C. C. Beney, Cambridge and London; Ursula Poussett Blackwell, Royal Free; J. D'A. Champney, Bristol; W. Collins, Sheffield; B. S. Cornell, Toronto; C. G. S. Corner, Madras and University College; H. Corsi, Cambridge and St. Bartholomew's; T. L. Crawhall, Cambridge and Durham; F. B. Dutton, St. Thomas's; H. V. Edwards, Cambridge and St. George's; A. F. M. Fuoss and H. A. Hill, Birmingham; J. Hope, Manchester; R. M. Humphreys, Oxford and St. Thomas's; N. E. F. Kemm, Bristol; F. W. M. Lamb, Birmingham; G. B. Lowe, Cambridge and Birmingham; J. T. C. McAuslin, Edinburgh; E. J. Papenfus, St. Thomas's; A. V. Pegge, Cambridge and St. Bartholomew's; D. C. Rennie, Birmingham; W. M. Savery, Middlesex; C. K. Scales King's College; G. H. Sims, St. Thomas's; G. K. Stone, Oxford and St. Bartholomew's; E. B. Verney, Cambridge and St. Bartholomew's; and W. Worger, Bristol.

Midwifery.—Y. Abdel Messiah, Middlesex; J. F. Adams, Toronto; N. D. Ball, University College; L. S. Banes, St. Mary's; H. F. G. Berncastle, Guy's; H. Black, Toronto; M. C. Breese, Westminster; J. Brodetsky, London; W. E. Brown, Toronto; T. A. Butcher, University College; J. D. Byrd, Manchester and St. Bartholomew's; F. Cavers, University College; A. E. Clark-Kennedy, Cambridge and London; A. E. Collie, Cambridge and Middlesex; H. C. Cox, St. Bartholomew's; H. T. Cubbon, Cambridge and St. Thomas's; P. C. Datta, Edinburgh; I. Davies, Westminster; W. Davies, London; L. S. Debenham, Guy's; H. V. Edwards, Cambridge and St. George's; C. F. Eminson, Charing Cross; P. Feraci, Middlesex; G. H. FitzGerald, Guy's; H. P. Gabb, University College; C. Gill-Carey, Guy's; B. A. M. Gordon, London; Gwenvron Mary Griffiths, Royal Free; W. R. G. Harris, London; M. S. Hashish, St. Bartholomew's; W. E. Heath, Cambridge and St. Bartholomew's; C. L. Hewer, St. Bartholomew's; F. R. G. Hief and J. M. Higginton, Cambridge and St. Thomas's; C. P. Hines, St. George's; E. S. Jones, Birmingham; A. M. Kazim, University College; G. S. L. Kemp, Sheffield; E. F. Kerby, Guy's; A. O. Knight, Middlesex; H. J. Levieseur and A. K. D. Lewis, Guy's; G. S. Lewis, Bristol; S. S. Lindsay, St. Thomas's; N. H. Little, Toronto; J. J. M. MacDonnell St. Thomas's; J. A. Mackenzie, Manitoba; E. K. Maclellan, Dalhousie; Gladys Matthews, Royal Free; Daisy Kathleen Fairbairn Michael, Charing Cross; E. Miller, Cambridge and London; L. M. Moody, King's College; J. W. W. Newsome, Middlesex; Esther Novinsky, Royal Free; A. A. Osman, Guy's; Marguerite Henrietta Pam, St. Mary's; E. R. Peirce, Birmingham; J. Peter, Middlesex; L. D. Porteous, St. Bartholomew's; Mary Millicent Prior, St. Mary's; P. W. Putnam, Cambridge and London; P. G. Quinton and W. E. K. A. Quitmann, University College; Constance Amy Randall, Royal Free; R. H. Reece St. Bartholomew's; F. W. Reitz, Guy's; C. E. Rice, Cambridge and Birmingham; J. S. L. Roberts, University College; J. S. Rogers, King's College; C. C. Rowland and S. N. Sennett, London; A. G. Shurlock, Cambridge and St. Bartholomew's; W. H. Simmons, Guy's; G. J. Sophianopoulos, St. Bartholomew's; Frances Minnie Spickett, Royal Free; V. A. T. Spong, St. Bartholomew's; G. McK. Thomas, Guy's; G. E. Tilsley, Bristol; E. S. Toogood, Oxford and University College; W. R. Tutt, Toronto; J. E. de V. van der Merwe, Guy's; E. B. Verney, Cambridge and St. Bartholomew's; D. Wallice, Cambridge and London; J. P. Wells, Cambridge and St. Bartholomew's; A. T. Westlake, St. Bartholomew's; S. C. de S. Wijeyeratne, University College; H. E. Williams, London; H. P. Williams, Liverpool; J. M. Winnett, London; F. G. Wood, Cambridge and St. Thomas's; and V. D. Wyborn, Charing Cross.

ROYAL COLLEGE OF PHYSICIANS OF LONDON.—A Comitia was held on Oct. 25th, Sir Frederick Taylor, the President, being in the chair.—On the report of the Censors' Board the following candidates were admitted as Members: Dr. J. J. Conybeare, Dr. D. E. Fenwick, Dr. J. G. Greenfield, Dr. Helen M. M. Mackay, Dr. W. S. Sharpe, and Dr. J. C. Tull.—Eighty-nine candidates having conformed to the by-laws and regulations and passed the required examinations were granted licences to practise physic.—A report from the Committee of Management was adopted detailing a revision of the regulations relating to the Preliminary Examination in General Education.—Sir Dyce Duckworth was re-elected as the representative of the College upon the governing body of the University of Liverpool.—The Registrar proposed for the first time the following temporary by-law:—

That Dr. J. T. Calvert, who is resident in India, and Dr. Carey F. Coombs and Dr. Charles Singer, both of whom are detained abroad by military duties, be admitted to the Fellowship *in absentiâ*, any by-law to the contrary notwithstanding.

—A report from the Committee of Management, dated Oct. 2nd, was adopted as follows:—

1. That the following schools be added to the list of institutions recognised by the Board for instruction in chemistry and physics—namely, King Edward VII. Grammar School, Southampton; Lancing College.

3. The Committee recommend that the following school, which is already recognised for chemistry and physics, be also recognised for instruction in biology—namely, Bootham School, York.

—Dr. J. A. Ormerod was re-elected a member of the Committee of Management.—The President reported on the proceedings of the Committee of Reference during the past six months, and received the thanks of the College for his work on that committee.—The books and other publications presented to the College during the past quarter were submitted to the Comitia and thanks returned to the donors. After certain formal business the President dissolved the Comitia.

MATERNITY AND CHILD WELFARE.—In connexion with an exhibition on "Life-Saving in War-Time," held in the Belfast Municipal Library and Museum, the first of a series of lectures was delivered by Sir John Byers, on Oct. 23rd, the subject being "The Problem of Maternal and Child Welfare."

OPHTHALMIA NEONATORUM AND LOCAL AUTHORITIES.—In reply to a question in the House of Commons, Mr. Hayes Fisher, President of the Local Government Board, stated that it was the policy of the Board to press upon local authorities the great importance of arranging for hospital beds for infants suffering from ophthalmia neonatorum along with their mothers. Several of the larger local authorities had already made such arrangements. In the case of London the Metropolitan Asylums Board was prepared to provide two hospitals—one to serve the north of London and the other the south. Mr. Fisher added that 50 per cent. of approved expenditure under this head is repaid by the Board to local authorities out of the maternity and child-welfare grant, the grant being also available in aid of home nursing.

DONATIONS AND BEQUESTS.—The late Mr. George Gill, of Walsall, has left by will £1000 each to the Walsall and District Hospital and to the Walsall Victoria Nursing Institution.—By the will of Mr. Edward Sturdy, of Teddington, the testator has left £500 to the Royal Victoria Hospital, Bournemouth, and £200 each to the London Hospital and Queen Mary's Convalescent Hospital, Roehampton.—By the will of the late Mr. John Henry Welby the Charing Cross Hospital, the Royal Free Hospital, the London Hospital, and the Westminster Hospital will each receive £250.—The late Mr. Henry Woodward, of Shawclough, Rochdale, has left £500 each to Rochdale Infirmary and the Rochdale Memorial Home for Crippled Children.

A NATIONAL MEDICAL SERVICE FOR IRELAND.—At a recent meeting of the Irish Medical Committee a subcommittee to watch the interests of the Irish medical profession was appointed, and the secretaries and the chairman, Dr. R. J. Johnstone, were directed to communicate with the secretary of the Irish Convention to inform him of the attitude of their constituency regarding the establishment of a National Medical Service. In 1911 over 90 per cent. of the profession in Ireland declared in favour of the reform of Poor-law and other medical services in Ireland on the following lines: (1) A National Medical Service entered by examination, payment by the State of adequate salaries progressive according to service, and compulsory superannuation on retirement; (2) the establishment of a properly organised Public Health Service; (3) a system of hospitals accessible to all requiring treatment free from workhouse or pauper taint. The question of medical attendance on private patients in these hospitals should, it was pointed out, receive special consideration.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

National Health Insurance.

Sir E. CORNWALL has presented a Bill in the House of Commons "to amend the Acts relating to National Health Insurance." It has been read a first time.

Select Committee on Medical Examinations.

The Select Committee of the House of Commons, which was appointed to inquire into the subject of medical examinations and re examinations under the Military Service Acts, has resumed its sittings. At its meeting on Tuesday, Nov. 6th, at which Colonel GRETTON presided, Dr. JAMES GALLOWAY again gave evidence. He has been asked to undertake the duties of Chief Commissioner of Medical Service. He explained at length the new arrangements regarding the establishment of the ten recruiting areas, in each of which there was a Deputy Commissioner of Medical Service acting under the Chief Commissioner. The new medical boards that were being set up were composed of civilian medical practitioners, and in the great majority of cases the policy of the Ministry of National Service was to employ as part-time officers civilian practitioners actually at work in the area. Full facilities were to be placed at the disposal of men who desired to be re-examined. He expressed the view that the new system would simplify classification of recruits.

HOUSE OF COMMONS.

WEDNESDAY, OCT. 31ST.

Medical Examinations for the Army.

In reply to Mr. WATT, Mr. MACPHERSON (Under Secretary for War) said: The honourable Member is right in suggesting that some men with only one eye have been passed for the lower categories of combatant service in the Army, those known as B 1 and C 1, but none of these are now being passed for any category of combatant service. At the present time men who have lost the sight of one eye, if otherwise fit, are passed only for one or other of the auxiliary services of the Army.

Soldiers Suffering from Nerve-Strain.

Sir A. GRIFFITH-BOSCAWEN (Parliamentary Secretary to the Ministry of Pensions) informed Mr. KING that the policy was to retain in the Army all cases of soldiers suffering from nerve-strain who were likely to be categorised as fit for some form of military duty. Those likely not to be so fit were retained until they could be transferred to the Pensions Ministry. He was not aware of any proposal to recall for treatment under military control soldiers invalided through nerve-strain who had been already discharged from the Army.

Mr. KING asked whether instructions had been given to local committees to provide appropriate convalescent homes for ex-soldiers suffering from nerve-strain who had been discharged unrecovered to their homes.—Sir A. GRIFFITH-BOSCAWEN replied: Local War Pensions Committees are empowered to provide convalescent treatment for discharged disabled men whatever the nature of their disablement. The policy of providing special institutions for the class referred to, except in so far as they are suffering from neurasthenia in a severe form and are in need of special medical treatment, is, in the opinion of my advisers, open to serious question. The provision of convalescent homes generally is, however, stated to be inadequate in certain districts, and I am instituting inquiry into the matter with a view to remedying the deficiency where it exists.

Grants in Aid to Voluntary Hospitals.

Sir W. COLLINS asked the Financial Secretary to the War Office whether, in view of the increases in price of food, fuel, drugs, &c., since the amount of the grants-in-aid to voluntary hospitals in respect of the treatment of wounded soldiers was fixed, it was proposed to raise the scale of such grants to these institutions.—Mr. FORSTER wrote in reply: Yes, Sir, this point has been under consideration for some time, and an announcement will shortly be made.

THURSDAY, NOV. 1ST.

Treatment of Disabled Soldiers.

Mr. ANDERSON asked the Parliamentary Secretary to the Ministry of Pensions whether he was considering how to provide curative treatment on scientific lines for all sailors and soldiers suffering from rheumatism and tuberculosis; and whether he would consider the desirability of making grants so that, in addition to their pension, they might reside in health institutions under the care of specialists until every effort toward cure was made, seeing that this would, even in the monetary sense, be cheaper than to grant them pensions

hilst at the same time allowing them to lapse into chronic ıvalids.—Sir A. GRIFFITH-BOSCAWEN answered: Under ıe instructions of the Ministry, Local War Pensions Com- ittees have full powers to make arrangements with any isting institutions for the treatment of rheumatism, and ıose powers have been widely used. Should it be found that isting accommodation is insufficient, the Minister is ready give assistance towards meeting the need. Treatment for ıberculosis is provided by the National Health Insurance ommissioners in conjunction with the local health authori- es. In order that the disabled man may obtain the fullest lvantage of their arrangements grants have been made to ısist the funds of Insurance Committees and, in addition, ıe Minister has undertaken to provide the whole cost of eatment for advanced cases of this disease. Moreover, the inistry are at present considering the question of pro- ding after-care colonies where treatment and training may given in cases of this disease in its early stages. The ıourable Member may rest assured that every means ıssible will be adopted to bring about an effective cure herever cure is possible.

Ministry of National Service and Medical Examinations.

Sir H. GREENWOOD asked the Minister of National rvice what part of the Army Medical Services now ıder the War Office his department intended to take over. Sir A. GEDDES answered: The Ministry of National rvice has taken over from to-day that part of the functions the Army Medical Service which is concerned with the edical examination of the physical fitness of recruits and tential recruits. The responsibility of the Army Medical rvice for the performance of these functions passes com- etely to the Ministry of National Service. Civilian medical actitioners who have been employed on recruiting medical ards will, however, be eligible for re-employment under ıtional Service.

Civilian Medical Men and Army Work.

Mr. PERKINS asked the Under Secretary for War whether ery effort was made to utilise the services of those retired ilian medical men who would be willing to work as civil rgeons or to join the Royal Army Medical Corps provided at they could be employed at home in hospitals within ıch of their own homes but who for personal or domestic ısons could not break up their homes in order to serve in ıer localities.—Mr. MACPHERSON wrote in reply: The ıployment of civilian medical men willing to work as ilian medical practitioners in the neighbourhood of their mes is one for general officers commanding in chief of the rious commands. So far as the War Office is concerned ch offers are welcomed.

MONDAY, NOV. 5TH.

Criminal Law Amendment Bill.

Mr. RAMSAY MACDONALD asked the Home Secretary ether, in view of the state of public business and the likelihood of any progress being made with the Criminal w Amendment Bill this session, he would consider whether could use his powers under the Defence of the Realm Act otherwise to provide safeguards against the worst dangers which soldiers were beset and the grossest carelessness in nmunicating disease.—Sir G. CAVE replied: I regret the position to the Criminal Law Amendment Bill, the passage which would, in my opinion, reduce the evil referred to in question. It is for the Army Council to consider whether thing can be effected by a Regulation under the Defence the Realm Act.

The Course of Instruction in the Royal Army Medical Corps.

Replying to Major DAVID DAVIES, Mr. MACPHERSON wrote: dical men commissioned as officers in the Royal Army dical Corps undergo a short course of instruction in their itary duties, and much importance is attached to this ining, which is not confined to drill, but includes military itation, anti-gas protection, and the duties of a medical cer with troops in the field. It is not proposed to abolish special training, which is considered essential to the ciency of the officers concerned.

Hospitals for Venereal Disease.

Mr. ARNOLD WARD asked the Under Secretary for War ether military hospitals for venereal disease were being ated in or near urban districts in the Eastern Command; ether the local authorities had protested against this action; whether in such cases regard would be had to the wishes the local residents.—Mr. MACPHERSON wrote in reply: concentration of patients suffering from venereal eases in special hospitals under expert treatment ensures utmost advantage to health and the speedy return of men luty. The location of such hospitals in all commands a matter of difficulty. Feeling is strong against the use uildings for the purpose, and it has become necessary to ise hut-ments which are the property of the Government. very instance, not only in the Eastern Command, there been strong local opposition to the location of hospitals his nature. Every possible consideration has been given to representations, but there being no alternative, the hospitals have been located in hut-ments which could be spared, having regard to other military considerations.

TUESDAY, NOV. 6TH.

Medical Services in Mesopotamia.

Major DAVID DAVIES asked the Under Secretary for War whether Surgeon-General Sir William Babtie was appointed to his present position as Director of Medical Services at the War Office in recognition of the services he rendered in Mesopotamia; whether the causes of the breakdown of the medical services in Mesopotamia had been examined by any court-martial or court of inquiry; and whether the Army Council was satisfied as to what officer or officers must be held responsible for the breakdown of the medical services in Mesopotamia.—Mr. MACPHERSON replied: Surgeon-General Sir William Babtie was Director of Medical Services at the War Office before the report of the Mesopotamia Commission was issued. After the appearance of the report he was given leave pending its consideration. As I have already stated, Sir William Babtie submitted his explanation to the Army Council, who found it satisfactory, and he was recalled from leave to resume his official duties. I added that the Council still awaited the explanation of the other officers. From this it might be inferred, indeed it has been inferred, that these officers were called upon for their explanations at the same time as Sir William Babtie, and that they failed to submit them within a reasonable time. Such is not the case, and I regret very much that my reply should have given any ground for an inference both unwarrantable and unjust and prejudicial towards the distinguished officers concerned, who are, and have been, anxious to offer their explanations. Until all the explanations have been received I cannot answer the last part of my honourable friend's question.

Appointments.

Successful applicants for vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward to THE LANCET *Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week, such information for gratuitous publication.*

BARBOUR, D., M.B., Ch.B. Glasg., has been appointed Certifying Surgeon under the Factory and Workshop Acts for the Muirkirk District of the County of Ayr.

CHEYNE, Sir W. WATSON, K.C.M.G., C.B., F.R.S., Consulting Surgeon to King's College Hospital.

CUMMINS, W. E. A., M.D. R.U.I., one of the Medical Referees under the Workmen's Compensation Act, 1906, for the West Riding of the County of Cork (Macroom and Bandon Divisions) and for the portion of the East Riding of the County, including Cork City and Cork East Riding, except the towns of Passage Monkstown and Queenstown.

GOLDSMITH, B. K., M.B., Ch.B. Edin., D.P.H., Temporary Assistant Medical Officer of Health for Manchester.

GRANT, A. B., HIRCHMAN, N., and PONDER, E., Resident Surgeons to the Edinburgh Royal Infirmary.

KING, J. C., M.R.C.S., L.R.C.P. Lond., Certifying Surgeon under the Factory and Workshop Acts for the Barry District of the County of Glamorgan.

LEAKEY, C. M., L.M.S.S.A., Certifying Surgeon under the Factory and Workshop Acts for the Gunnislake District of the County of Cornwall.

TREADWELL, O. F. N., F.R.C.S. Eng., one of the Commissioners under the Prison Act, 1877.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index).

When the application of a Belgian medical man would be considered the advertisers are requested to communicate with the Editor.

BETHNAL GREEN BOARD OF GUARDIANS.—Temporary Medical Superintendent. Salary at rate of £550 per annum, with board, &c.

BIRKENHEAD AND WIRRAL CHILDREN'S HOSPITAL, Woodchurch-road.—House Surgeon.

BRISTOL ROYAL INFIRMARY.—House Physician and House Surgeon. Salary at rate of £120 per annum, with board, &c.

BURY INFIRMARY.—Junior House Surgeon. Salary £150 per annum, with board, &c.

EAST LONDON HOSPITAL FOR CHILDREN, Shadwell, E.—Resident Medical Officer. Salary £150 per annum, with board, &c.

GLAMORGAN COUNTY COUNCIL.—Temporary Female Medical Officer for medical inspection of children in public elementary schools. Salary at rate of £300 per annum.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton.—House Physician for six months. Salary 30 guineas.

LIVERPOOL COUNTY ASYLUM, Rainhill.—Temporary Assistant Medical Officer. Salary 7 guineas per week, with board, &c.

MAIDSTONE, WEST KENT GENERAL HOSPITAL.—Assistant House Surgeon. Salary £125 per annum, with board, &c.

MANCHESTER CHILDREN'S HOSPITAL, Pendlebury, near Manchester.—Female Resident Medical Officer, unmarried. Salary at rate of £200 per annum.

MANCHESTER ROYAL INFIRMARY.—Resident Surgical Officer, £225 per annum; Assistant Resident Surgical Officer; Accident Room House Surgeon; and Resident Medical Officer, Central Branch. £200 per annum each.

NETLEY, WELSH HOSPITAL.—Medical Officer. Salary at rate of £400 per annum, with board, &c.

NORTHAMPTONSHIRE SANATORIUM, Creaton, near Northampton.—Medical Superintendent. Salary £300 per annum, with board, &c.

NORTH-EASTERN HOSPITAL, St. Ann's-road, Tottenham, N.—Female Resident Temporary Assistant Medical Officers. Salary 7 guineas per week.

NOTTINGHAM GENERAL HOSPITAL.—Female Casualty House Surgeon for six months. Salary at rate of £250 per annum, with board, &c.

PADDINGTON GREEN CHILDREN'S HOSPITAL, London, W.—Female Resident Medical Officer. Salary at rate of £160 per annum, with board, &c.

PRESTON ROYAL INFIRMARY.—Resident Medical and Surgical Officer. Salary £120 per annum, with board, &c.

READING, ROYAL BERKSHIRE HOSPITAL.—House Surgeon for six months. Salary £275 per annum, with board, &c.

ROTHERHAM HOSPITAL.—Junior House Surgeon. Salary £150, with board, &c.

ROYAL EYE HOSPITAL, St. George's Circus, Southwark, S.E.—House Surgeon. Salary at rate of £150 per annum, with board, &c.

SURREY COUNTY COUNCIL.—Medical Officers for Mother and Infant Welfare and School Work. Salary £400 per annum.

SWANSEA UNION.—Resident Assistant Medical Officer to the Institution. Salary £300 per annum.

THE Home Secretary gives notice that he proposes to appoint a Medical Referee under the Workmen's Compensation Act, 1906, for County Court Circuit No. 9, and to be attached more particularly to the Stockport, Ashton-under-Lyne, and Stalybridge and Hyde County Courts. Applications should be addressed to the Private Secretary, Home Office, not later than Nov. 23rd, 1917.

THE Chief Inspector of Factories, Home Office, S.W., gives notice of a vacancy for a Certifying Surgeon under the Factory and Workshop Acts at Bangor, Carnarvon.

Births, Marriages, and Deaths.

BIRTHS.

CAMPBELL.—On Nov. 1st, at the Priory Nursing Home, Cambridge, the wife of Lieutenant-Colonel R. D. Campbell, D.S.O., A.A.M.C., of a son.

FURBER.—On Oct. 17th, at Spero, Salisbury, the wife of Major T. Maynard Furber, A.A.M.C., of a daughter.

GWYNNE HOWELL.—On Oct. 29th, at Llanelwedd Hall, Builth, Wells, the wife of Captain F. D. Gwynne Howell, D.S.O., M.C., R.A.M.C., of a son (stillborn).

LAMBKIN.—On Nov. 3rd, at Grove Lodge, Ingatestone, the wife of Temporary Lieutenant-Colonel E. C. Lambkin, R.A.M.C., of a daughter.

WATSON.—On Nov. 1st, at Earlham-road, Norwich, the wife of Dr. Henry Watson, of a son.

MARRIAGES.

ALDRIDGE—KNEVITT.—On Monday, Nov. 5th, 1917, at Emanuel Church, Plymouth, by the vicar, the Rev. Dr. Flynn, Charles Aldridge, M.D., of Belle Vue House, Plympton, S. Devon, to Edith Knevitt, of 4, Thom Park Terrace, Mannamead, Plymouth.

CROSBIE—GILLILAND.—On Oct. 30th, at St. Augustine's Church, Londonderry, Captain Douglas B. Crosbie, M.C., R.A.M.C., to Meg, only child of Mr. and Mrs. Robert K. Gilliland, Ardcaien, Londonderry.

SHIRES—ROBINSON.—On Oct. 31st, at All Saints Church, Bentley-road, Sefton Park, Liverpool, Captain Bertram Shires, R.A.M.C., to Vera, only daughter of the late Mr. and Mrs. Wellburn Grainger Robinson, Meadowfield, Whitby, Yorkshire.

DEATHS.

BRISTOW.—On Nov. 1st, at Amesbury-avenue, Streatham-hill, S.W., George Hamilton Bristow, M.D., F.R.C.S.I., aged 50.

ELLISON.—On Nov. 1st, at Eton, Lieutenant-Colonel William Augustine Ellison, M.V.O., M.D., Surgeon to His Majesty's Household at Windsor.

MARTIN.—On Nov. 5th, at The Gables, Crawley, Sussex, Timothy Henry Martin, J.P., M.R.C.S., L.S.A., aged 80.

MCVAIL.—At 3, St. James'-terrace, Glasgow, on Nov. 4th, Sir David Caldwell McVail, M.B., F.R.F.P.S.G.

O'KELLY.—On Oct. 30th, at the residence of her uncle, George Wilson, Esq., Slaney-road, Walsall, Sarah (Sallie), dearly beloved wife of Captain Fitzgerald O'Kelly, R.A.M.C., of Cross Lodge, Boldon, Newcastle-on-Tyne, age 33.

WHIPHAM.—On Nov. 3rd, at Fishleigh House, Hatherleigh, Devon, Thomas Tillyer Whipham, M.D. Oxon., F.R.C.P. Lond., Consulting Physician to St. George's Hospital, aged 78 years.

N.B.—A fee of 5s. is charged for the insertion of Notices of Births, Marriages, and Deaths.

Notes, Short Comments, and Answers to Correspondents.

A MEDICAL PRACTITIONER AND A CORONER.

To the Editor of THE LANCET.

SIR,—On Oct. 4th I was called to see an old patient whom I had previously attended for chronic valvular disease of the heart. She was in bed and complained of pain over the region of the stomach with sickness. I prescribed for her and saw her again the next day when she was considerably relieved, and asked me not to come too often. However, on the 8th I saw her again, when she showed signs of ascites with swelling of feet and legs. The bowels had been freely opened daily, the sickness had ceased, and she was better in every way. On the 11th I saw her again; there was an increase of fluid made out by palpation and percussion; the bowels had acted and she had not been sick. However, as she was more or less by herself all day, and did not wish me to call too often, I suggested that she should go to the infirmary, and gave her a note for the relieving officer, as I thought in the event of tapping being required she would be better looked after. I heard no more until the following Monday, the 15th, when the coroner's officer came to me and handed me a subpœna to attend an inquest on my patient the next day. He told me that she had been admitted to the infirmary and was placed on the table for operation and died under the anæsthetic. At a subsequent post-mortem it had been found that she had intestinal obstruction, peritonitis, abscess in the pelvis, and commencing cancer of lower bowel.

At the coroner's court the next day I gave evidence having been called by the coroner. I was submitted to a cross-examination as to my method of treatment and the drugs I had given, and was asked why I had not discovered all the things found after death by the pathologist, Dr. R. S. Trevor. I protested against this, for every medical man will know how easy it is to be wise after the event. Moreover, I was not present at the post-mortem, not having been notified that this was going to take place, and I could not accept the coroner's statement, which I could not verify. The patient had not shown any symptoms pointing either to intestinal obstruction, cancer, or abscess in the pelvis, and 36 hours had elapsed from the time of the examination. The coroner who had summoned me told me brusquely to "*Stand down*," because I disagreed with his view that I ought to have discovered things of which there were no symptoms during the life of the patient.

I received no fee for attendance, and on application to the coroner's officer next day I was told over the telephone by that officer that he had instructions from the coroner *not to pay me*. I then made a formal application to the coroner direct, and next morning the officer handed me the fee, remarking that he had made a mistake in giving me a subpœna, "*that the coroner merely wanted me to be there—in my own interests.*"—I am, Sir, yours faithfully,

JAMES SMYTH, M.D.

Wandsworth Common, S.W., Oct. 21st, 1917.

*** We have compared a long report of the inquest which appeared in the *South-Western Star* on Friday, Oct. 19th, with Dr. Smyth's letter, and his account of the proceedings is substantially supported thereby. The patient's cardiac condition accounted for her prominent symptoms, while no signs pointed especially to malignant stricture, nor did any of her complaints indicate the existence of such a condition. When it became obvious that she would have to go to an institution for operation Dr. Smyth rightly recommended this course to her. At the infirmary it was decided to operate for intestinal obstruction, and the patient died during the administration of the anæsthetic. At the post-mortem examination the disease of the heart and large blood-vessels, which had been recognised by Dr. Smyth, were found, and, in addition, malignant disease of the intestine. Mr. Oddie, the coroner whose duty it was to inquire into the cause of death of the patient, subpœnaed Dr. Smyth and inquired why he had not found, while the woman was alive, the malignant disease which, after death, was discovered. Dr. Smyth replied correctly in pointing out that he was not present at the post-mortem examination, so that he did not know from personal observation what conditions other than those which he had himself discovered were actually present. But at this point in his evidence, according to the report in the *South-Western Star*, "'Stand down,' said the coroner abruptly." Dr. Smyth seems to us to have done everything that he could in the interest of his patient while she was alive and to have given proper evidence at the inquest. Comment on the case in the *South-Western Star* commences with the following sentence: "It would be regrettable if there should be any renewal of the strained relations which at one time existed in this district between the

Comments, Notes, and Correspondence

coroner and members of the medical profession." We have no idea what the reference to "strained relations" means, but we recommend that when medical witnesses are subpœnaed by a coroner "in their own interests" they should have those interests watched over in court by their legal advisers.—ED. L.

MEDICAL MATTERS IN BERLIN.

THE Berlin correspondent of the Munich *Medical Journal* gives a graphic picture of medical matters in Berlin during the early October weeks. A public exhibition is being held in the Kaiserin Friedrich's House to keep up the interest in small-pox awakened by the epidemic of last spring. In this exhibition the work of Jenner is properly recognised. The question of fees is agitating the medical profession in Berlin. The public, on the one hand, inclines to think that the extra work laid on doctors brings with it a sufficiently increased income, while the doctors themselves point out that this does not balance the all-round additions to the cost of living. The difficulty of heating the consulting-room affects not only the medical man, but the patients who visit him. On cold wintry days it is hardly fair to ask a patient to disrobe to be examined, and to forgo this makes the consultation of doubtful value. The amenities of city practice are gone. It is becoming more and more difficult to get about. A taxi-cab is a rarity; travel by tram, omnibus, or underground railway wastes much time, the longer period occupied in the crowded journeys being almost unbearable. The insufficient, almost absent, street lighting in the later hours of the night makes a visit at this time an adventure. The doctor, called out of his nocturnal rest, frequently finds himself translated into rural conditions unfamiliar to him, and it is only with a lantern that he can safely go abroad. The correspondent concludes with these words: "Nevertheless, all these inconveniences we shall have to bear without complaint, for we know that they are unavoidable for the moment."

TREATMENT OF THE INVALIDED SAILOR OR SOLDIER.

To the Editor of THE LANCET.

SIR,—The statement in THE LANCET of Oct. 27th (p. 655) by the Gloucester Local Medical and Panel Committee that it is unfair for the above treatment to be given by non-panel men as well an panel men (and which seems to be endorsed by you) is so unjust that I venture to ask you to reconsider your opinion. In the first place, it is merely carrying out the promise of the author of the Bill of freedom of choice of doctor for the patient by contracting out if his doctor was not on the panel, and freedom for the doctor by attending on the pooling system if he did not wish to work under the Act. In the second place, taking this town as an example, more than one-third of the profession held, and still hold, to their word and the "scrap of paper" they signed some years ago. Owing to the action of the Local Insurance Committee, almost none of their patients were allowed to contract out, and so the panel men got several hundred patients of the non-panel men. This never troubled them, but if the panel men now object to these sailors and soldiers being allowed the choice of going to the non-panel men, then the injustice and absurdity of the complaint is so great as to be almost ludicrous.—I am, Sir, yours faithfully,

RAYMOND H. SHAW, M.S., M.B. Durh.

Great Yarmouth, Oct. 30th, 1917.

*** But we did not endorse the statement attributed to the Gloucestershire Local Medical and Panel Committee.—ED.L.

"CELESCO."

IN our issue of Sept. 1st we published an analytical notice of a preparation named "Teekoe," which was offered as an economic substitute for tea, coffee, and cocoa. We found that its basis was reduced cocoa shell, which yields notable amounts of theobromine, fat, and proteins when treated with boiling water, and, moreover, the "tea" so obtained is quite agreeable to the palate and not "stodgy." We now understand that this preparation is shortly to be put on the market under the name of "Celesco," and a recent sample submitted to us gave results on analysis identical with those given by "Teekoe." The newer preparation shows an improvement in regard to the uniformity of the flakes. It yields a mild, stimulating and nutritive infusion.

C. J.—There is already a station in the district where the deposit is collected, and the results appear in our monthly returns. The attention of the Advisory Committee on Atmospheric Pollution (47, Victoria-street, Westminster, London, S.W. 1) might be called to the matter.

The following journals, magazines, &c., have been received:—Annales de Medecine, Practitioner, American Journal of Surgery, Journal of the Missouri State Medical Association, British Journal of Ophthalmology, British Journal of Dermatology, American Journal of Medical Sciences, National Medical Journal, British Dental Journal, Annali di Medicina Navale e Coloniale, Bulletin of the Johns Hopkins Hospital, Pacific Medical Journal, Medico-Legal Journal.

Medical Diary for the ensuing Week.

SOCIETIES.

VENEREAL DISEASE TREATMENT.

LIQ. SANTAL FLAV. c. BUCHU ET CUBEBÂ (HEWLETT'S)

Originally introduced by us in 1877, and has become a standard remedy all over the world in the treatment of CHRONIC DISEASES of the URETHRA, &c.

THE LANCET wrote, December 8th, 1877:—

"A safe and valuable remedy. It mixes perfectly with water, and, as it can be taken with ease, it is sure, we think, to come into common use."

THE BRITISH MEDICAL JOURNAL wrote, December 15th, 1877:—

"Messrs. C. J. Hewlett & Son have forwarded to us a 'Liquor Santal Flav. cum Buchu et Cubebâ'; it is readily miscible with water, and when administered proves to contain all the medicinal virtues rightly attributed to these drugs."

DOSE: One to two drachms in water or milk.

Price, in England ... 11s. lb.

To ensure obtaining the Original Preparation, please write "LIQ. SANTAL FLAV. c. BUCHU et CUBEBÂ (HEWLETT'S)," or the title may be conveniently abbreviated to "Liquor Santal Co. (HEWLETT'S)."

IODERMIOL BOUGIES AND PESSARIES.

IODERMIOL is a bland emollient, non-irritating and non-staining preparation of Iodine, superior to the official tincture or ointment in strength. It is perfectly miscible with oils, and a 10% solution in Almond Oil has been successfully employed in injections.

IODERMIOL BOUGIES contain 25% Iodermiol, and are approximately equal in strength to the B.P. tincture of iodine, without the disadvantages of that preparation. They have been used with great success in various stages of the disease.

Price ... ... 2s. 6d. per dozen.

IODERMIOL PESSARIES also contain 25% Iodermiol and have been found useful in inflammatory conditions of the Uterine organs.

Price ... ... 3s. 6d. per dozen.

TABLETS POT. IODID. et HYDRARG. PERCHLOR.—These tablets have been made for several years and proved very successful. They contain 5 grains Potass. Iodid. and $\frac{1}{16}$ gr. Hydrarg. Perchlor.

In bottles of 100 ... ... 30s. per doz.

VITAMINES:

Their Nature and Properties.

UNTIL a few years ago it was considered by Physiologists that an ideal dietary consisted of 5 classes of Food Stuffs:

Proteids	**Salts**
Carbohydrates	**Water**
Fats	

and experiments to determine the value of various foods, and enquiries into animal metabolism were based upon this idea.

Recently, however, it has been conclusively proved that there is something else which must be taken in the food in order to allow animals to grow, and to maintain their bodies in a healthy condition. This new substance has been called by Funk —— **Vitamine.** Its exact nature and the method in which it acts have not so far been determined, but it probably is of the nature of one of the so-called "internal secretions," hormones, or enzymes, the immense importance of which in the living organism has long been known.

One of our leading Physiologists makes the strong statement that "an animal, or at any rate a young animal, cannot live on protein alone, even If mixed with appropriate mineral salts, and with a proper supply of fat and carbohydrate to supply the necessary energy; these other organic compounds of uncertain nature are **absolutely indispensable.**"

VITAMINE is essential for the proper growth of Animals.

Professor Hopkins has conducted a very interesting series of experiments on the importance of Vitamines.

It has been previously found by Osborne and Mendel that synthetic dietaries which were capable of maintaining the life of full grown rats were quite unable, no matter that the protein, to maintain the growth processes in young animals, while small additions of tissue extracts were sufficient to induce growth. They also proved that after a time the animals declined, and unless a change in diet was instituted they died.

Hopkins fed a number of rats on an artificial diet consisting of casein (Proteid), fat, starch, sugar. By estimating the total energy consumption of the food he found that the rats fed upon this synthetic diet ceased to grow at a time when their intake was more than sufficient quantitatively to maintain normal growth.

In conclusion, Hopkins states, "**Results and figures make it perfectly clear that some factor in diet other than its protein and energy content is indispensable for growth.**"

Another important point was brought out by Hopkins in these experiments, that "a given increment of weight was obtained with much greater economy when the portion of milk was added to the artificial dietary."

The Influence of Vitamine on "Deficiency Diseases."

The fact that Vitamine is necessary for the normal metabolic processes to be properly carried out in man is proved by a study of what have been called the "Deficiency Diseases," including Beri-Beri, Pellagra, Scurvy, and Rickets.

Beri-Beri.

Beri-Beri is a disease which was very prevalent in the Malay Peninsula and other Countries where rice is the staple article of diet. The rice grain consists of an inner part and an outer husk. In polished rice the outer husk is removed, and the natives, who lived chiefly on such rice, suffered from Beri-Beri. It was found that the additions of the husk, or the substitution of unpolished for polished rice, was sufficient to cure the disease. The symptoms of this disease are such as arise from peripheral neuritis, or atrophy of the peripheral nerves with subsequent degeneration of the muscles, including the heart muscle. A Government report for Siam shows the marvellous improvement in the death rate of prisoners from Beri-Beri following upon the substitution of unpolished for polished rice in the year 1909.

Deaths from Beri-Beri in 1906 ...	... 113
1907—1908 ...	... 104
1908—1909 ...	... 122
1909—1910 ...	... 3
1910—1911 ...	... 3
1911—1912 ...	... 0

The "something" contained in the rice husk which prevents or cures Beri-Beri has been shown by Funk to consist of Vitamine. He has succeeded in extracting it from the rice husk in a more or less pure state.

Vitamogen not only contains all the essentials of a complete food, but enables the body to utilize other food to better advantage owing to the action of **Vitamine** as a ferment.

MANUFACTURERS:

Vitamogen Ltd

24/26, HOLBORN. E.C. 1.

VITAMOGEN is not an expensive preparation —a 2/- tin contains approximately 4 ozs., and a 4/6 tin 12 ozs., so that it is within the reach of all classes.

Packed in 7 and 14 lb. tins for Hospital use, &c.

Samples are sent without charge to Medical Men.

Alcresta Tablets of Ipecac in Amebic Dysentery

and in Endamebic Pyorrhea

The oral administration of the ipecac alkaloids is proving more advantageous than the hypodermatic injection of emetine, especially in the treatment of endamebic carriers and in the prevention of relapses.

UNCOATED AND DISINTEGRATING—CAUSE NO NAUSEA

Each tablet contains the alkaloids (emetine and cephaeline) from ten grains of Ipecac, U. S. P., held in an adsorption compound with hydrated aluminum silicate. The tablets disintegrate but this adsorption compound passes through the acid contents of the stomach and releases the alkaloids only in the alkaline intestinal secretions—thus preventing gastric disturbances.

Ten or twenty tablets, representing one hundred or two hundred grains of ipecac, may be given in a day without vomiting or nausea.

Distributed through the Drug and Dental Trades in bottles containing 40 and 500 tablets. Further information on request.

LISTERINE

A trustworthy, unirritating solution composed of volatile and non-volatile antiseptics; extensively and satisfactorily employed in dilution up to 25% as a wet dressing for surgical and accidental wounds.

LISTERINE

Suitably diluted, applied by injection, douche or spray, often serves a useful purpose in catarrhs and conditions involving hyper-secretion from mucous surfaces. It is an efficient deodorizer.

LISTERINE

On account of its boric and benzoic acid constituents, forms a suitable lotion in dermatitis following vaccination. In various cutaneous disorders its use allays excessive itching or irritation, and promotes cleanliness while exercising its antiseptic effect.

Battley's Solution of Opium.

Liquor Opii Sedativus

(BATTLEY)

THE OLDEST and still THE BEST Hypnotic and Sedative.

Advantages:

¶ May be given with the greatest safety, being pure and free from harmful matter.

¶ No disagreeable after-effects follow its use.

¶ Never varies in strength.

The *Medical Annual* writes:

"**Battley's Solution of Opium** is a common word in the Practitioner's vocabulary. It has gained its reputation by its intrinsic value as a remedy which contains all that is sedative and anodyne in opium without its resinous constituents, which are, therapeutically speaking, impurities."

Strength—Twice that of Tinctura Opii B.P. Usual Dose—5 to 15 minims.

Issued in 2 oz., 4 oz., 8 oz. and 1 lb. bottles.

NOTE.—We do not guarantee our preparations unless in original bottles with the autograph of Richard Battley over each cork and on the label, without which none is genuine.

Sole Manufacturers:

BATTLEY & WATTS, 18 Wellclose Sq., London, E.

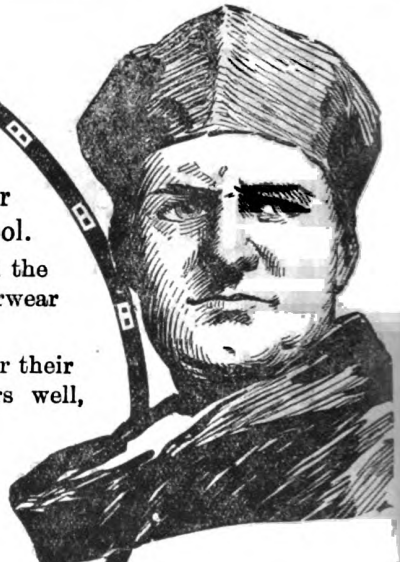
WOMEN WORKERS:

Their Health and Housing.

THE Government and other hostels and welfare clubs, which have been erected in many districts in the interests of women workers and of public health in this and the coming generation, usually ensure hygienic and economical comfort for their inhabitants by the use of gas apparatus throughout.

Gas cooking appliances, which eliminate the risk of waste in fuel or food; a gas fire in each sitting-room; and a slot-meter geyser in every bath-room mean that when the day's labour is over the workers can obtain a well-cooked meal, pleasing and healthful warmth—**radiant** heat, be it noted—and a hot bath at very moderate cost to themselves and the minimum of trouble to the staff.

Further information can be obtained on application to the Secretary, The British Commercial Gas Association, 47, Victoria Street, S.W 1., an advisory and research body representing the chief undertakings of the United Kingdom.



W. 79.

Wolsey the Dependable

IN spite of war difficulties and war restriction—Wolsey is wool—pure wool.

No matter what the cost of wool may be—and the cost is now considerably enhanced—Wolsey Underwear will always remain the same—pure wool.

Wolsey garments may always be recommended for their hygienic and dependable qualities. Wolsey wears well, washes well, and is guaranteed unshrinkable.

Wolsey

Pure Wool Underwear

For men, women, and children. See the Trade Mark on every garment.

The manufacturers of Wolsey will be glad to show any Doctor over their factories at any time they may be in Leicester. A post-card will ensure arrangements being made to receive him.

By Permission of the Publishers of Braun's Local Anaesthesia

The Theory of Local Anaesthesia.

IF the area marked "B" in the above diagram is flooded with a weak solution of Kerocain all the sensory nerve endings in that area will come under its action and an insensitive field for a minor operation will result, or a stronger solution of Kerocain injected into the centre of the area "A" would become gradually diffused throughout the area "B" (the anaesthetic action being at its maximum at the point of injection)

Again, the area "B" can be anaesthetised by injection into or near the nerve trunks at "C" and "D."

Kerocain

Kerfoot's Novocain

is chemically, physiologically, and therapeutically identical with German novocain. It possesses in full measure those properties of low toxicity, non-irritation, complete sterilisibility, rapid penetration and compatibility with adrenalin combined with immunity from habit-creation that have made novocain the most desirable of all local anaesthetics.

The above diagram and explanatory notes are extracted from our new 32 page illustrated booklet on "The Theory and Practice of Local Anaesthesia," a copy of which will be sent free to any Surgeon on request.

BLENOSAN
CAPSULES

As a routine
treatment for

GENITO-URINARY CONDITIONS.

BLENOSAN is a mixture of the finest East India Santal Oil with a specially prepared fluid extract of Kava-Kava. It is presented in the form of accurately-measured Capsules, and affords an ideal medicament for the treatment of all inflammatory conditions of the urethra.

BLENOSAN is an improvement upon the ordinary Santal, and the full proportion of the alpha resin of Kava-Kava ensures all the anæsthetic and diuretic properties of the root in a standardised and dependable form.

BLENOSAN CAPSULES consequently are indicated in all pathological conditions which affect the genito-urinary system, including acute Cystitis, Vaginitis, and Leucorrhœa, and where intense hyperæmia and swelling of the mucous membrane give rise to a diminution of the urinary canal.

BLENOSAN CAPSULES are well adapted for the continuous and systematic treatment of such cases, and are being used with excellent results by many of the most experienced and successful Physicians.

BLENOSAN CAPSULES can be prescribed for a course of treatment extending over two or three weeks.

3 Unique Synthetics of well-established value.

Formamint

A true chemical combination of Formic Aldehyde and milk-sugar.

Indicated in all forms of bacterial Sore Throat and inflammations of the oral cavity.

Also as a Prophylactic against Infectious Diseases, such as Measles, Diphtheria, Scarlet Fever, Mumps, Pyorrhœa Alveolaris, &c.

Yields a greater amount of germicidal materials than spray or douche, and affords prolonged and persistent disinfection of the mouth and throat without difficulty or pain.

Writing in *The Practitioner*, a physician says: "Having tried all the B.P. lozenges and the proprietary antiseptic lozenges, I have become reduced to one, and one only—namely, Formamint."

Cystopurin

A safe and effective Urinary Antiseptic, representing a distinct advance on other preparations of Hexamethylene-tetramine.

A surgeon writes in *The Lancet*: "Cystopurin can be employed freely, safely, and effectively in all affections of the urinary tract, whether of toxic or bacterial origin."

Albulactin

The Lancet says: "Albulactin represents the proteid which predominates in human milk. Its addition to diluted cow's milk is of great advantage in infant-feeding."

The above preparations are now the absolute property of an all-British Company, and are manufactured at Penzance and London by the original unique processes on which their efficacy depends.

"THE HOUSE FOR EVERYTHING ELECTRO-MEDICAL."

THE "GALVANOSET" No. 1.

The Latest Development in MEDICAL ELECTRICITY.

SEND FOR DESCRIPTIVE PAMPHLET.

For any Continuous Current supply of any voltage ... ... Price £8 8 0

Extra for Faradisation Attachment ... ... ,, £1 15 0

For TRUE GALVANISATION, TRUE FARADISATION, IONISATION, UNDULATING CURRENTS, ELECTROLYSIS, MUSCLE REACTION TESTING, ILLUMINATION OF SURGICAL LAMPS.

The "GALVANOSET" is a device for safely utilising the main supply of electricity for medical purposes.

The following advantages render the "GALVANOSET" superior to all other methods:—

Nothing to get out of order. Nothing to wear out. Any desired current.
No expense for upkeep. Costs less than one farthing per hour to run. Light and portable.
Always ready for use. Safe under all circumstances. Provides a true galvanic current.
Does not require re-charging. Finest range of adjustment. Weighs 7 lbs. only.

The Commandant of the Red Cross Auxiliary Hospital for Officers, 11, Chichester-terrace, Brighton, writes:—

"I shall be obliged if you will send me by return another Galvanoset. The two I have already are working excellently. You will remember that the current is 220 continuous."

Demonstrations Daily on Ionisation, Galvanisation, Faradisation, Electrolysis, &c., 3 to 6 p.m.

MATLOCK SANATORIUM

Situated on the edge of the mountain limestone area of Derbyshire, over 700 feet above sea-level. The buildings face south and command beautiful views, while on the north and east they are sheltered by lofty hills. The surrounding country is well known for its great beauty and interest. The climate is dry and bracing. The buildings are lighted by electricity and heated by radiators.

Treatment is carried out on modern lines, all special methods being available in suitable cases. A new X-ray apparatus has been installed, and there is a complete equipment for the carrying out of up-to date methods in all Tubercular and other Pulmonary cases.

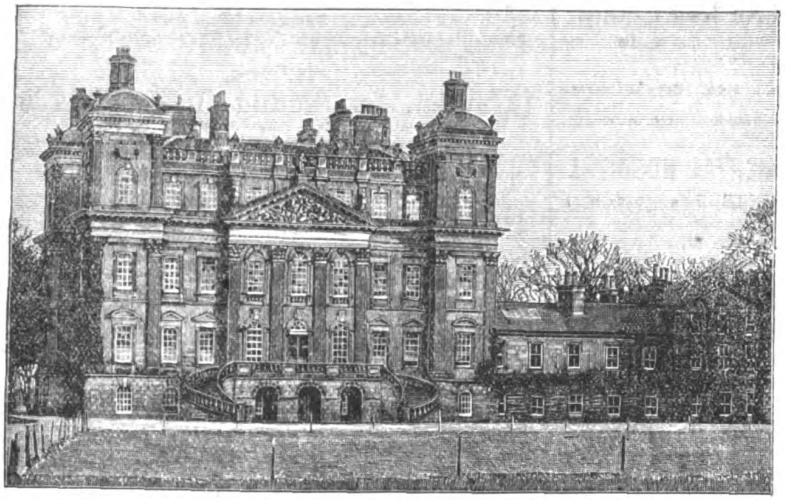
For particulars apply to FREDERICK KINCAID, M.R.C.S., L.R.C.P., Medical Superintendent, Matlock Sanatorium, Matlock, Derbyshire. Telephone and Telegraph: SANATORIUM, MATLOCK 22.

VALE OF CLWYD SANATORIUM

This Sanatorium (opened 1901) is established for the Treatment of Tuberculosis as carried out by Dr. OTTO WALTHER of Nordrach. It is situated in the midst of a large area of park-land, at a height of 450 feet above the sea-level, on the western slopes of mountains rising to over 1800 feet, which protect it from North and East winds and provide many miles of carefully graduated uphill walks—similar in character and extent to those at Nordrach.

Small rainfall. Porous subsoil. Large amount of sunshine. Electric Lighting and Hot Water Radiators in each room.
The physician himself was a patient at Nordrach.
For particulars, apply to GEORGE A. CRACE-CALVERT, M.B., &c., Llanbedr Hall, Ruthin, North Wales

PENDYFFRYN HALL SANATORIUM



(NORDRACH-IN-WALES.)

Physicians: Dr. G. M. DOBSON and Dr. GERATY.

FOR THE OPEN-AIR AND INOCULATION TREATMENT OF ALL FORMS OF TUBERCULOSIS.

One of the first Sanatoria opened in the United Kingdom to carry out the treatment as practised at Nordrach. Carefully graduated walks rise through pine, gorse, and heather to a height of over 1000 feet above sea level, commanding extensive views of both sea and mountains. Sheltered from E. and N.E. winds. Climate mild and bracing. Small rainfall. Large average of sunshine. There are over five miles of walks in the private grounds. Rooms heated by hot-water radiators and lit by electric light.

Telegrams: Pendyffryn; and Telephone: 20 Penmaenmawr. Apply, Secretary, Pendyffryn Hall, Penmaenmawr, North Wales.

J. & A. CHURCHILL

"There are some books which it is a real pleasure to review, and this falls into that category. ..... **A comprehensive account of the special diseases of women.** ..... **The illustrations** *generally* **are** *so* **excellent** *and* **many strikingly so.** ..... *A valuable addition to any gynæcological library.* ..... **One of the best** *books on the subject of recent years.* ..... **A notable work."**—EDIN. MED. JOUR.

With 513 Magnificent Illustrations and 20 Coloured Plates. 27s. net; postage 8d.

EDEN & LOCKYER'S GYNÆCOLOGY.

By **EDEN** and **LOCKYER**, Obstetric Physicians, Charing Cross Hospital.

"A book which is the best of its particular kind known to us—certainly in this country, and probably in the English language ..... a book which ought to spring at once into first place amongst British text-books of Gynæcology; a book which may be confidently recommended to both students and practitioners, and one that no Gynæcologist, in particular no teacher of the subject, can afford to neglect."—BRITISH MEDICAL JOURNAL.

FOURTH EDITION. 354 Illustrations. 18s. net; postage 7d.

EDEN'S MANUAL OF MIDWIFERY.

By **THOMAS WATTS EDEN**, M.D., F.R.C.S., F.R.C.P.

"We have nothing but praise for this book; a most excellent text-book."—THE LANCET.

VOLUME XXXVII. With 7 Plates and 32 Text-figures. 12s. 6d. net.

THE TRANSACTIONS OF THE OPHTHALMOLOGICAL SOCIETY OF THE UNITED KINGDOM.

SESSION 1917. With Lists of Officers, Members, &c

FIFTH EDITION. 12 Plates (11 in Colours), 612 Text-figures. 21s. net.

A MANUAL OF PATHOLOGY.

Including Bacteriology, the Technic of Post Mortems, and Methods of Pathologic Research.

By **W. M. LATE COPLIN**, M.D., Professor of Pathology, Jefferson Medical College, Philadelphia.

BOOKS ON DENTISTRY.

TOMES' DENTAL ANATOMY.

Edited by **MARETT-TIMS** and **HOPEWELL-SMITH.**
SEVENTH EDITION. 229 Illustrations. 15s. net.

TOMES' DENTAL SURGERY.

FIFTH EDITION. 318 Illustrations. 15s. net.

HOPEWELL-SMITH'S DENTAL ANATOMY.

With 6 Plates and 340 Text-figures. 18s. net.

HEWLETT'S SERUM AND VACCINE THERAPY.

BACTERIAL THERAPEUTICS AND PROPHYLAXIS, BACTERIAL DIAGNOSTIC AGENTS.

200 Authors, 5000 Pages, 1000 Illustrations. FOUR VOLUMES. Five Guineas net.

A SYSTEM OF TREATMENT.

Edited by **ARTHUR LATHAM**, M.D., F.R.C.P., Physician, St. George's Hospital; and **T. CRISP ENGLISH**, C.M.G., M.B., B.S., Surgeon, St. George's Hospital.

"Carefully written, concise, and yet practical. Details are given of any procedure recommended sufficient to enable the reader to apply it practically. Prescriptions are given in full instead of vague statements as to drugs recommended, and all of them have been submitted to a consulting druggist, who is responsible for their correctness from the pharmaceutical point of view. The editors have been catholic in their inclusion of subjects, and the 'System of Treatment' is in every sense comprehensive."—THE LANCET.

London: J. & A. CHURCHILL, 7, Great Marlborough Street, W. 1.

ELLIS'S DEMONSTRATIONS OF ANATOMY (TWELFTH EDITION.)

Revised and Edited by **CHRISTOPHER ADDISON**, M.D., B.S.Lond., F.R.C.S.,
Lecturer on Anatomy, Charing Cross Hospital Medical School; formerly Hunterian Professor, Royal College of Surgeons, England; Examiner in Anatomy, Royal College of Surgeons, England, &c.

Illustrated by 306 Engravings on Wood, 75 of which are in Colour.

Follows the ordinary course of dissection taken by students, beginning with the simpler anatomy of the upper and lower limbs and ending with the more complex parts of the head and neck and the organs contained therein. **12s. 6d.** net.

NEW AND THOROUGHLY REVISED EDITION (THE SIXTH).

AN INDEX OF SYMPTOMS WITH DIAGNOSTIC METHODS

By **RALPH WINNINGTON LEFTWICH**, M.D., late Assistant Physician to the East London Children's Hospital; Author of "Tabular Diagnosis," "A Pocket-Book of Treatment," "Syphonage in the Large Intestine," &c. Crown 8vo **10s. 6d.** net.

BRITISH MEDICAL JOURNAL.—"The new edition has been brought up to date generally, and has been amplified by the addition of two new sections that should render it more self-contained than it was. ..... The book is purely a book of reference, and it should be in the hands of all senior students of medicine and medical practitioners. It will be found a very present help in trouble in those cases—unfortunately so frequent—in which a diagnosis is not made for lack of no more than a little clear thinking."

NEW AND THOROUGHLY REVISED EDITION (THE THIRTEENTH).

A HANDBOOK OF PHYSIOLOGY.

By **W. D. HALLIBURTON**, M.D., F.R.S., Professor of Physiology, King's College, London. 13th Ed., being the 26th of "KIRKES'." With nearly 600 Illustrations, including Coloured Plates. **16s.** net.

BRITISH MEDICAL JOURNAL.—"The book is well recognised as a standard work on physiology for medical students and physiologists. ..... The medical student will find in it all he requires for the passage of his examinations in physiology, and we recommend the volume to him with all confidence."

SEVENTH EDITION, REVISED BY PROF. F. W. GAMBLE, D.Sc., F.R.S.

PRACTICAL ZOOLOGY: A JUNIOR COURSE.

By the late **Prof. A. MILNES MARSHALL**, M.D., D.Sc., F.R.S., and the late **C. HERBERT HURST**, Ph.D. Revised by **Prof. F. W. GAMBLE**, D.Sc., F.R.S. **10s. 6d.**

"Few text-books of Practical Zoology have met with such deserved success."—BRITISH MEDICO-CHIRURGICAL JOURNAL.

AN INDEX OF MEDICINE.

By **SEYMOUR TAYLOR**, M.D., M.R.C.P. A Manual for the use of Senior Students and Others. With Illustrations. **12s. 6d.** net.

JOHN MURRAY, Albemarle Street, LONDON, W.1.

SAUNDERS'

IMPORTANT BOOKS

Cullen's Diseases of the Umbilicus

SUPERB ILLUSTRATIONS

Dr. Cullen's new work contains chapters on embryology, anatomy, infections in the new-born, hæmorrhage, granulation tissue at the umbilicus, umbilical polypi, gastric mucosa at the umbilicus, Meckel's diverticulum, intestinal cysts, patent omphalomesenteric duct, prolapsus of the bowel, concretions, abscess, Paget's disease, diphtheria, syphilis, tuberculosis, atrophy, fæcal fistula, hypertrophy, angioma, lymphocele, connective-tissue growths, dermoids, sweat-glands, abdominal myomata, papilloma, adenomyoma, cancer, sarcoma, hernia, exstrophy of the bladder, urachus and its diseases, acquired urinary fistula, &c., &c.

The DUBLIN JOURNAL OF MEDICAL SCIENCE says: "*We know no monogram on the subject so full, so informative, so exhaustive, or so valuable.*"

Octavo of 775 pages, with 269 illustrations. By THOMAS S. CULLEN, M.B., Assistant Professor of Gynæcology, Johns Hopkins University. Cloth, 35s. net.

Moorhead's Traumatic Surgery

This work appeals to the surgeon, the practitioner, the mining, railroad, and industrial physician, those having to do with Compensation Law, accident insurance and claims, and legal medicine. But its greatest appeal is to the *general practitioner*, because practically the entire work is devoted to those conditions that form a part of every doctor's daily practice.

Octavo of 760 pages, with 520 line-drawings. By JOHN J. MOORHEAD, M.D., Associate Professor of Surgery, New York Post-Graduate Medical School and Hospital. Cloth, 28s. net.

Greene & Brooks' Genito-Urinary & Kidney

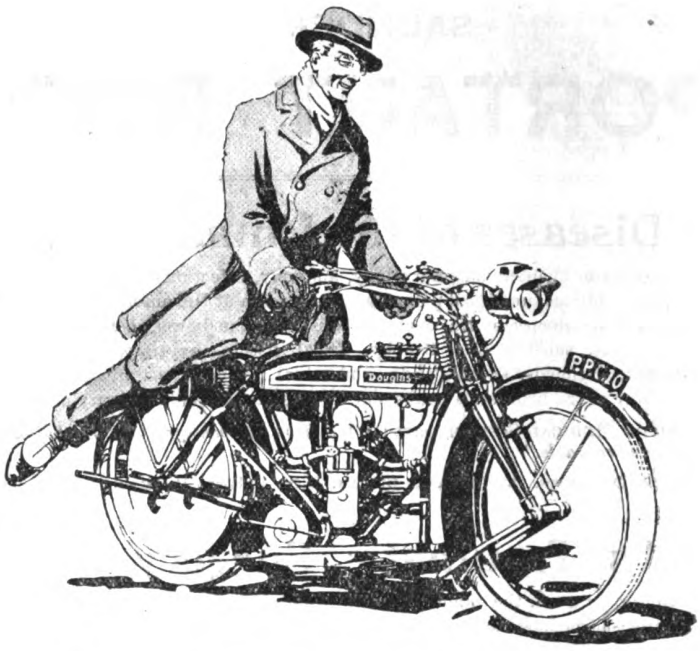
The joint work of an internist and a surgeon, you get both the *medical* and *surgical* sides. The *office treatment of gonorrhea*, including *vaccine treatment*, is so described that any practitioner can treat this condition in his own office. Many prescriptions are included.

Octavo of 666 pages, illustrated. By ROBERT H. GREENE, M.D., Professor of Genito-Urinary Surgery, Fordham University; and HARLOW BROOKS, M.D., Assistant Professor of Clinical Medicine, University and Bellevue Hospital Medical College. Cloth, 24s. net.

Surgical Clinics of Chicago

This bi-monthly gives you the instruction of 40 surgeons of Chicago, representing 15 leading hospitals of that city. Every important point in the history and its analysis, the deciding factors in the diagnosis, the details of treatment, the successive steps in the operative technic, the after-management, are strongly emphasized.

Issued serially, one octavo of 225 pages, illustrated, every other month (six volumes a year). Per Clinic Year (February to December). Sold by the Year only. Cloth, £3 net; Paper, £2 2s. net.



Crile's The Kinetic Drive

ITS PHENOMENA AND CONTROL.

In this book Dr. Crile analyses the mechanism by which the present-day industrial and commercial "speeding" is accomplished, and relates it to the speeding due to other stimuli, such as infections, auto-intoxication, physical injury, &c. The work is as interesting as it is timely. It makes extremely stimulating reading.

Octavo of 71 pages, illustrated. By GEORGE W. CRILE, M.D., Professor of Surgery, Western Reserve University, Cleveland. Cloth, 8s. 6d. net.

W. B. SAUNDERS COMPANY, 9, Henrietta Street, London, W.C. 2.

Use a Douglas Motorcycle

ALWAYS ready at a moment's notice, the speedy little DOUGLAS can be relied upon to take you to your destination without delay or breakdown and without covering you in oil and mud from head to foot.

Every gallon of petrol will take you four times as far as it would take a car, and the DOUGLAS is infinitely cheaper to run.

Hundreds of Doctors have proved the DOUGLAS to be an invaluable Wartime investment. Permits can easily be obtained, and we have a limited number of models available.

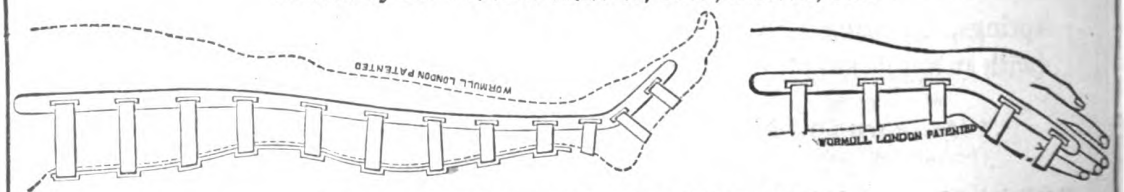
RELIABLE LIGATURES.

In ligature and suture material, there can be nothing better conceived for the sterile and aseptic preparation and conveyance of the same, than a hermetically sealed glass tube. Catgut or silk, as it is prepared in our laboratories must reach the surgeons' hands in absolutely sterile condition.

This is our positive guarantee.

BREAKABLE TUBES.



These Tubes possess advantages known to no other tubes. The perfection of Johnson & Johnson's Laboratory preparation of Ligature and suture material cannot be obtained elsewhere.

THE SYSTEM OF ALUMINIUM SPLINTING

Devised by Sir FREDK. TREVES, Bart., G.C.V.O., C.B.

CHEAP, ASEPTIC, LIGHT, AND EVERLASTING.

By this system of Splinting with length 10 ft. of Side Bar weighing 1 lb., and 10 ft. Strip weighing 5 ozs., a Splint for almost any part of the body can be made. A number of smaller splints may be produced with the same quantity of material.
This material can be sterilised and used over and over again without impairing its strength.

E. WORMULL, 51, Bargery Road, Catford, London, S.E.

THE BRITISH ORGANOTHERAPY CO., LTD.,

respectfully invites the attention of Practitioners to the following extensively prescribed and successful products.

LYMPH SERUM. A pluriglandular product for hypodermic injection, the base of which is Spermin. Employed with great success in combating nervous disorders and in arresting, by compensation, organic degeneration. It has proved especially useful in the treatment of Locomotor Ataxia, Disseminated Sclerosis, and other degenerative conditions of the Spinal Cord.

LYMPHOID COMPOUND. A pluriglandular preparation with Spermin as its base and put up in soluble gelatine capsules. Widely prescribed, with exceptionally gratifying results, in Nervous Instability, Neuroses, Psychoses, Shock, Insomnia, and in conditions resulting from glandular insufficiency, metabolic disorder, imperfect oxidation, impairment of nutrition, or fatigue and exhaustion, and in Impotentia.

OVAMAMMOID COMPOUND. A product of great service, the professional demand for which (as in the case of the other products) is extensive and constant. Put up in soluble gelatine capsules, and having for its base Ovarian Extract and Mammary Gland Extract of maximum activity, it compensates for Ovarian Insufficiency and all conditions resulting therefrom, secures normal functioning in Amenorrhœa and Dysmenorrhœa, and controls the disturbances of the menopause.

HÆMATOTHYROIDINE. A trustworthy product employed successfully in the treatment of Exophthalmic Goitre. It is scientifically prepared from materials derived from the Serum (together with all the active principles extracted from the blood) of thyroidectomised horses.

EUKINASE. A scientifically prepared product containing the entire condensed duodenal juice in a dried state and in an active and unalterable form. It contains in a maximum degree of activity the digestive ferment Enterokinase and Secretin. This product is employed with gratifying results in the treatment of Duodenal Insufficiency and conditions arising therefrom. Constipation, Intestinal Indigestion, Pancreatic Insufficiency, Gastro-Intestinal Insufficiency, Infantile Diarrhœa and Fermentation, Diarrhœa of Adults, Steatorrhœa, Coprostasis, Dyspepsia, Flatulence, Nausea, Anorexia, Emaciation, and Glycosuria are other conditions which have responded well to this product.

DESCRIPTIVE LITERATURE POST FREE TO PRACTITIONERS ON APPLICATION.

First Class Award for Liquors and Liquid Extracts and Pharmaceutical Preparations International Medical Exhibition, London, '81.

Battley's Liquors

First Class Award at World's Industrial Exposition, New Orleans, 1885, Bronze Medal, St. Louis, 1904.

The following preparations have for many years been used and prescribed by medical men; they are therefore thoroughly recommended both on account of their high therapeutical properties and their great purity as galenical preparations.

Liquor Opii Sedativus (Battley)
Dose: 5 to 15 minims.
The Oldest and still the Best Hypnotic and Sedative.
Twice the strength of Tinctura Opii B.P.
Safe in use. No disagreeable after effects.
Composition always reliable.

Liquor Cinchonæ Cord. (Battley)
Dose: 2 to 15 minims.
The most reliable preparation of Cinchona Bark.
Contains all the active principles of Yellow Bark.
Will remain unaltered for a great length of time, being free from starch, etc.

Liquor Cinch. Pallidæ (Battley)
Dose: 2 to 15 minims.
A well-known and useful preparation in Malarial Diseases and in Convalescence after Illness.
Does not disturb the stomach.

Liquor Secalis Cornuti (Battley)
Dose: 20 to 60 minims.
Pre-eminent among Ergotic Preparations for Purity and Strength, and has proved to be unrivalled in the following therapeutical actions:—As an Emmenagogue and Ecbolic, in Post Partum Hæmorrhage, as a Hæmostatic, etc.

Battley's Liquors are issued in 2 oz., 4 oz., 8 oz. and 1 lb. bottles.
They are prepared according to the original process of the late Richard Battley.

BATTLEY & WATTS, 18 Wellclose Square, LONDON, E.

Eases the Cough, Facilitates Expectoration, Soothes the Irritable Stomach, Promotes Nutrition.

That in a nutshell is why Angier's Emulsion is so widely and systematically used in treating pulmonary tuberculosis.

Angier's Emulsion tends to conserve and reinforce natural resources. It antagonizes the characteristic wasting of phthisis by soothing the sensitive, irritable stomach, and facilitating the digestion and assimilation of nourishing food.

ANGIER'S EMULSION

PETROLEUM WITH HYPOPHOSPHITES

Angier's Emulsion has a specific palliative influence upon the symptoms of phthisis—fever, night sweats, cough, expectoration and exhaustion are ameliorated by its use.

Angier's is pleasant to take, will not become distasteful, and in most cases of phthisis its use will obviate the necessity of administering depressing or narcotizing cough sedatives.

A SUGGESTION.

Send us a Post-card for Samples of LACTOPEPTINE to prescribe in a case of Flatulent Dyspepsia or Infantile Diarrhœa.

1. No one has successfully imitated the digestive value of Lactopeptine.
2. Lactopeptine is an ideal digestive remedy which commends itself to every Medical Practitioner on account of its uniformity of action, published formula, and extreme palatableness. :: :: :: ::
3. Lactopeptine is one of the certainties of Medicine, and in this respect ranks with quinine. :: :: :: :: :: ::
4. INDICATIONS: Dyspepsia, Infantile Diarrhœa, Acute Indigestion, Morning Sickness, Impaired Nutrition, Flatulent Dyspepsia. :: ::

When prescribing, specify in all cases Lactopeptine (Richards).
Supplied in ½ oz., 1 oz., 4 oz., and 8 oz. bottles.
John Morgan Richards & Sons, Ltd., 46 Holborn Viaduct, London, E.C.

LACTOPEPTINE

POWDER TABLETS ELIXIR

Prescribed by the Medical Profession for 35 years.
The LANCET (London, Eng.) describes it as—"Mr. Benger's admirable preparation."

BENGER'S FOOD.
"Cause and Effect" explained.

BENGER'S FOOD is a cereal flour free from indigestible and irritant particles and scientifically combined with natural digestive principles, which cause it to become, after preparation, one of the most easily assimilated and highly nutritive foods extant, and one which leaves very little insoluble or irritant residue.

The digestive process is easily and simply regulated by allowing the food to stand, after the mixing with warm milk, for 5 to 45 minutes.

The effect is that the casein in the milk, which otherwise would form tough indigestible casein curd in the stomach, can only separate into minute flocculae; in addition both the protein and carbohydrate material in the food itself are partially converted, so as to be easily assimilated by weakened digestive systems.

This explains why Benger's is frequently retained when all other foods are rejected—why it can be taken by the most delicate infant, and by persons prostrate with illness.

Benger's Food

for INFANTS, INVALIDS AND THE AGED,
is sold throughout the World by Chemists, &c., in sealed tins.

A sample, with full particulars, will be sent post free to Members of the Medical Profession on application to Sole Manufacturers:

BENGER'S FOOD, Ltd., Otter Works, MANCHESTER, Eng.

Branch Offices:—NEW YORK (U.S.A.), 90, Beekman Street. SYDNEY (N.S.W.), 117, Pitt Street.
And Depôts throughout CANADA.

N.B.—BENGER'S FOOD is the direct outcome of the pioneer work on digestive ferments, by the late Sir William Roberts, M.D., F.R.S. and the late Mr. F. Baden Benger F.I.C., F.C.S. in 1880, since when it has been the premier dietetic preparation of its kind in the British Empire.

OVALTINE

TONIC FOOD BEVERAGE

IN THE SICK ROOM.

The ease of preparation of "Ovaltine" is an obvious advantage. The granules on being dropped into hot milk dissolve in a few seconds. Troublesome and tedious cooking processes are thus avoided.

A cup of "Ovaltine" contains as much nourishment as three eggs, and is digested and absorbed with the minimum of strain to the digestive functions. Its flavour is always acceptable even to the most fastidious and during prolonged courses. "Ovaltine" is distinguished from ordinary invalid foods in being unusually rich in organic phosphorus compounds. This combined with its high nourishing value has a remarkable effect in hastening the recuperation of convalescents, and in building up emaciated patients.

HORMONE THERAPY

THE undermentioned preparations of the glands of internal secretion are offered with full assurance as to their identity and quality. While the therapeutic indications for some of them are well established, the sphere of others is not yet clearly defined, and these are supplied without recommendation being implied. Reference is suggested to articles which appeared in THE PRACTITIONER, November, 1917 (p. 474), also January, February, and August, 1915; THE MEDICAL PRESS, August 16, 1916, November 29, 1916, November 7, 1917; ENDOCRINOLOGY, January, 1917, &c.

ANTERIOR LOBE PITUITARY GLAND TABLETS (P., D. & Co.)

Tablets representing 2½ grains of the desiccated substance are supplied in bottles of 25 and 100; 5 grains, in bottles of 50 and 100.

POSTERIOR LOBE PITUITARY GLAND TABLETS (P., D. & Co.)

Tablets representing 3 grains of fresh substance are supplied in bottles of 25.

PITUITRIN (P., D. & Co.)

This physiologically standardised extract of the posterior lobe of the pituitary body is supplied in ampoules of 0·5 and 1 c.c., also in vials of 10 c.c.

SUPRARENAL GLAND, DESICCATED (P., D. & Co.)

In bottles of 1 ounce.

SUPRARENAL GLAND CAPSULES (P., D. & Co.)

and

SUPRARENAL GLAND TABLETS (P., D. & Co.)

Each capsule or tablet represents 2 grains of the desiccated gland. In bottles of 100.

ADRENALIN CHLORIDE SOLUTION, 1 in 1000 (P., D., & Co.)

This first-introduced solution of the active principle of the suprarenal gland is supplied in ampoules of 0·5 c.c., also in vials of 10 c.c. and 1 fluid ounce. Particulars of other Adrenalin preparations will be forwarded on request.

CORPORA LUTEA, DESICCATED (P., D. & Co.)

The prepared yellow granular material from the ovaries of animals. In bottles of 1 ounce.

CORPORA LUTEA CAPSULES (P., D. & Co.)

Each capsule contains 5 grains of the desiccated substance. In bottles of 25 and 100.

CORPORA LUTEA SOLUBLE EXTRACT (P., D. & Co.)

For hypodermic administration. In ampoules of 1 c.c.

THYROID GLAND, DESICCATED (P., D. & Co.)

Prepared from selected healthy glands. Free from ptomaines. Assayed and guaranteed to contain not less than 0·2 per cent. of iodine. Supplied in bottles of 1 ounce.

THYROID TABLETS (P., D. & Co.)

Prepared from the foregoing assayed product. Supplied in bottles of 100, 500, or 1000 tablets of the following strengths:—¼, ½, 1, 1½, 2, 2½, 3, 5, or 10 grains of *fresh gland* (corresponding to 1/10, 1/5, 1/3, 2/5, 1/2, 3/5, 1, or 2 grains of *desiccated gland*, respectively).

THYROPROTEIN TABLETS (P., D. & Co.)

Tablets containing 1/50, 1/25, or 1/10 grain of thyroprotein (the pure proteid of thyroid gland separated from the inert substance) are supplied in bottles of 50 tablets.

THYROPROTEIN SOLUTION (P., D. & Co.)

For hypodermic administration of the active principles of the thyroid gland. In ampoules of 1 c.c.

PARATHYROID GLAND TABLETS (P., D. & Co.)

Tablets containing 1/10 grain of the desiccated substance, carefully separated from extraneous material, are supplied in bottles of 100.

TETRAGLANDULAR TABLETS (P., D. & Co.)

Each tablet contains 3/4 grain Desiccated Suprarenal Gland, 1/3 grain Desiccated Pituitary Gland, 1/3 grain Desiccated Thyroid Gland, and 1/40 grain Desiccated Parathyroid Gland. In bottles of 25 and 50.

PINEAL GLAND TABLETS (P., D. & Co.)

Each tablet represents 1/2 grain of fresh pineal gland substance from young cattle. In bottles of 25 and 100.

THYMUS GLAND, DESICCATED (P., D. & Co.)

In bottles of 1 ounce.

THYMUS GLAND CAPSULES (P., D. & Co.)

Each capsule contains 2 grains of the desiccated substance. In bottles of 100.

Further particulars of the above-mentioned will be sent on request.

WINTER MILK FOR BABIES

LORD RHONDDA'S BIG CONTRACT.

A supplementary supply of milk for infants has been arranged by the Ministry of Food, who have contracted for what is considered to be an adequate quantity of dried milk which can be supplied to medical officers of health and to institutions needing it during the winter.

The total amount of full cream dried milk which may be available approximates 2,200 tons, representing nearly 4,000,000 gallons of whole milk when reconstituted. The Ministry state that this milk will be suitable for infant feeding.

The Ministry of Food has purchased 2,100 tons

of

Glaxo

FULL CREAM DRIED MILK

No greater tribute has ever been paid to a Baby Food than the placing of this enormous order by the Ministry of Food—the Official Board appointed by Parliament for controlling the food supplies of the country.

Could any stronger proof be offered of the suitability of GLAXO Full Cream Dried Milk for infant feeding?

Samples, Analysis, & Bacteriological Report Post Free on Application to

ROYAL VINOLIA TALCUM POWDER.

FOR TOILET, NURSERY, AND MASSAGE.

THIS absorbent, antiseptic powder can be recommended with every confidence for use in the Nursery or Sick Room. It soothes and refreshes by keeping the skin cool and comfortable. It prevents chafing and does not clog the pores.

Royal Vinolia Talcum Powder is of special benefit during massage treatment when excess perspiration manifests itself, as, unlike many other preparations used in these conditions, it has no irritating effect on the skin.

Royal Vinolia Talcum Powder contains no irritating perfume. Its delicate odour is pleasant without being obtrusive. The special method of packing makes it the most convenient and economical form for use in private practice or hospitals.

In Drums with Sieve Tops 1/-

Vinolia Baby Soap, *a guaranteed neutral and pure vegetable soap. Specially recommended for the tender skins of infants.* 4½d. *per tablet.*

TRADE MARK A.D.1715.

Advances in Treatment

CONSTIPATION

"Byno Chrismol"

(TRADE MARKS)

marks a new departure in the treatment of Chronic Constipation, etc. It presents 50 per cent. by volume of "Chrismol," a specially selected and purified Russian mineral oil in intimate combination with the "Allenburys" Malt Extract.

"Byno Chrismol" possesses the following advantages:

It is prepared with mineral oil of the proper viscosity and chemical constitution to ensure efficient lubrication with a complete absence of bye-effects.

The intimate combination of the mineral oil and "Allenburys" Malt Extract without an emulsifying agent, ensures the maximum activity of the oil as a lubricating agent, and removes the inconvenience that sometimes follows insufficient admixture of the lubricant with the intestinal contents.

It possesses no oily taste. The "Allenburys" Malt Extract present assists digestion and assimilation.

"Byno Chrismol" is specially indicated in Chronic Constipation with symptoms of auto-intoxication, Intestinal Stasis, Mucous Colitis and in the convalescent stage of Typhoid Fever; also after Child-birth, during the nursing period and whenever a simple laxative is required by child or adult.

DOSE: A dessert-spoonful, or more, two or three times a day.

In bottles at 2/6 and 4/6 each. **Sample free on request.**

In Convalescence After Acute Disease.

'Byno' Hypophosphites

TRADE MARK

"One of the most popular tonics of the day."
British Medical Journal.

"Byno" Hypophosphites combines the nutritive and digestive principles of the finest Malt Extract with Hypophosphites, a powerful tonic nerve food. It is much superior to the official syrup, and in many years' clinical experience has given most gratifying results. "Byno" Hypophosphites may be taken when ordinary tonics cannot be tolerated.

As a General Tonic

"Byno" Hypophosphites is unrivalled; it contains a variety of principles which each have their particular therapeutic value.

Tuberculosis

In the wasting of Tubercular Cachexia it tends to reduce the temperature, improve the appetite, increase the weight, and rehabilitate the nervous system.

Typhoid Fever

In the slow convalescence from Typhoid Fever it is an easily absorbed and highly nutritious tonic food. "Byno" Hypophosphites helps the enfeebled digestion, decreases the anæmia, and improves the general tone of the nervous system. Owing to the presence of 'Bynin,' it is not constipating in its action.

FORMULA:

Calcium Hypophosphite	2 gr.
Potassium ,,	2 ,,
Sodium ,,	2 ,,
Iron ,,	¼ ,,
Manganese ,,	¼ ,,
Cinchona Alkaloids	1½ ,,
Nux Vomica ,, *Equal to Strychnine*	⅛₀ ,,
Bynin" Liquid Malt	1 oz.

Influenza and Malaria

For those debilitated by Influenza, Malarial and Tropical Diseases, it has proved itself an invaluable restorative and reconstructive.

In Old Age

For the Aged and Infirm there is no preparation so acceptable and so readily assimilated. It stimulates a flagging heart and is not only a tonic but a food.

Brain-Fag

It is surprisingly successful in cases of cerebral exhaustion with digestive disturbance, and constitutes a mild, yet efficient invigorator in general brain-fag. "Byno" Hypophosphites restores tone to the heart muscle and arteries, and is a blood-producing agent as well as a concentrated nutrient.

'Byno" Hypophosphites is one of the best tonics ever put forward for combating the after-effects of severe illness or as a general invigorator when the system is enfeebled. It may be prescribed with confidence to enrich the blood, strengthen the gastro-intestinal functions, give tone to the nerves, and nourish and vivify the whole organism.'

Prices: In bottles 3/- & 5/6 each. Sample sent free on request.

ALLEN & HANBURYS LTD., Lombard St., LONDON.

Clinical Experience

is the ultimate test by which the value of any article, medicinal or dietetic must be determined.

During the past fifteen years the practising physician has had ample experience of the usefulness of Sanatogen in nervous disorders, disturbances of metabolism and organic diseases, gout, uric acid diathesis, nephritis, cardiac disease, anæmia, and most varieties of malnutrition.

He knows that Sanatogen is the only therapeutic food **proved** to furnish the body cells with phosphorus and nitrogen in true synthesis, and therefore truly assimilable. And he knows that the clinical evidence for Sanatogen is fully corroborated by laboratory and physiological tests.

SANATOGEN

is now the absolute property of an all-British company, and is manufactured at Penzance by the original unique processes on which its efficacy depends.

Though the cost of manufacture has greatly increased, **the retail prices are unchanged**; and it is worth noting that these work out at only about sixpence per day for the usual dosage. We mention this because many physicians regard Sanatogen as an expensive product, though in reality it is cheaper in use than many less valuable preparations which are not so regarded.

For Samples and Literature apply to—

GENATOSAN, LTD. (British Purchasers of the Sanatogen Co.),
Chairman: Lady Mackworth,
12, CHENIES STREET, LONDON, W.C. 1.

(Sanatogen will later on be re-named "Genatosan" to distinguish it from so-called substitutes.)

COMBATS SERIES, 172—SIAMESE

For Treatment of Gonorrhœa

TRADE **'SOLOID'** MARK

BRAND

TRADE **'NIZIN'** MARK

'Nizin' is a Zinc Salt of Sulphanilic Acid

Stimulating antiseptic for injections. Non-irritating and non-toxic in the strengths recommended. Solutions of gr. 2 to gr. 6 to the ounce highly successful. Gr. 1 to the ounce gives good results in eye affections.

'Soloid' 'NIZIN,' gr. 2 and 0·15 gm. are supplied in bottles of 100 at 1/0; gr. 20 and 1 gm. in bottles of 25 at 2/0 and 1/8 per bottle, respectively. 'NIZIN' is supplied in bottles of 1 oz. at 1/0, 4 oz. at 3/6, and 16 oz. at 12/0 per bottle.

TRADE MARK **'SOLOID'** BRAND

Silver Proteinate

Silver Proteinate contains 8·3 % of silver

Replaces German Protargol. Of value in gonorrhœa, ophthalmia, etc. The 'Soloid' product is freely soluble, and solutions of strengths ordinarily used are non-irritating. Four grains to the ounce forms approximately a 1 % solution (½ % to 2 % usually employed, 10 % or stronger also used).

'Soloid' Silver Proteinate, gr. 1, is supplied in bottles of 100 at 1/6; gr. 4 in bottles of 25 at 1/4 and 100 at 4/0 per bottle.

A Powerful Antiseptic for Infected Wounds, etc.

TRADE **'SOLOID'** MARK

BRAND

TRADE **'TOLAMINE'** MARK

Sodio-p-Toluenesulphonchloroamide, referred to as Chloramine-T in the B.M.J., Jan. 29, 1916, *page* 160

Its germicidal action, molecule for molecule, is stated to be about four times that of sodium hypochlorite. Non-corrosive, non-coagulant and practically non-toxic.

Supplied as follow:
gr. 8·75, bottles of 100, 4/0 per bottle
gr. 87·5, tubes of 10, 3/6 per tube

"MALTINE"

"Maltine" presents the proteids, carbohydrates, and organic phosphates of malt in an agreeable, convenient, and readily assimilable form. It is standardised in diastase, concentrated, and semi-liquid, and perfectly soluble.

Special Indication:—

In Infant Feeding, to humanise cow's milk and prevent constipation.

Full particulars, together with complete Feeding Tables, giving the proportions of milk and water for different ages and periods of feeding, as also samples of "MALTINE," may be obtained free of charge by Medical Men on application to the Company.

"MALTINE" WITH IRON.

Each Fluid Ounce contains— IRON PYROPHOSPHATE ... ... 8 grains.

This is a particularly bland and assimilable preparation of Iron, in which the astringency of the ferruginous salt is counteracted by the slightly laxative action of the "MALTINE" base.

The word "MALTINE" is our Trade Mark.

In prescribing please specify "MALTINE COMPANY."

THE MALTINE MANUFACTURING COMPANY, Limited,
183, ACTON VALE, LONDON, W. 3,
Will be pleased to send Samples Free of Charge to Medical Men.

CARNRICK'S "LIQUID PEPTONOIDS."

Beef, Milk, and Wheat (Pre-digested).

"LIQUID PEPTONOIDS" is a sustaining, reconstructive, mildly stimulating fluid nutrient, ready for immediate absorption and assimilation. It is aseptic, eminently palatable, free from extractive material, completely pre-digested, and sufficiently concentrated to nourish a patient for a considerable time during critical stages of severe illness when other forms of food are refused.

THE LANCET writes:—"A very valuable food .... a very powerful and agreeable tonic and stimulant."

SAMPLES FREE TO MEDICAL MEN.

CARNRICK & CO., Limited, 183, Acton Vale, London, W. 3.

An Introduction

TO A DEBATE ON

THE VALUE AND LIMITATIONS OF SANATORIUM TREATMENT.

Delivered before the Medical Society of London on Nov. 12th, 1917,

BY T. D. LISTER, M.D. LOND., F.R.C.S. ENG.,
PHYSICIAN TO THE MOUNT VERNON HOSPITAL FOR CONSUMPTION.

GENTLEMEN,—When I was asked by your President to make some remarks introductory to a discussion on the value and limitations of sanatorium treatment, I was struck by two things. The first was the opportuneness of such a discussion by this old, independent and responsible society. It was surely a keen sense of the present need of reconsideration of this matter that led your President to select it. The second was the opportunity afforded to me of airing and no doubt clarifying some of my own rather heterodox views in a pleasant atmosphere.

THE PRESENT POSITION.

No longer, unfortunately, can we speak of the losses by tuberculosis as being greater than the ravages of war. War has crippled our resources for dealing with social problems, of which tuberculosis is perhaps, if not certainly, the greatest, at any rate the index disease. War has done more, because it has led by its disturbance of pre-existing social conditions to an increased incidence of the disease. We are therefore wise to take stock of our present methods and endeavour to form a judgment as to their value, and limitations.

From the annual report for 1916–17 of the medical officer of the Local Government Board we gather that the deaths from pulmonary tuberculosis, as compared with 1913, have increased by 1582 in 1914, 4621 in 1915, and 4490 in 1916 Representing the experience in 1913 by the relative figure 100 the deaths have increased by no less than 12 per cent. Many explanations are suggested in the report. This increase has been associated with an excessive mortality from influenza, as was seen also in the years 1890-91-92 and in 1899–1900. The report emphasises the fact that both men and women in industrial employment have been exposed to conditions leading to the spread of tuberculosis and to the calling into activity of latent disease; also that the record would almost certainly have been worse but for the organised effort to improve housing conditions in areas with populations swollen by war work; also that there have been overwork and exposure to irritating dust, and, owing to migration, overcrowding under conditions unfavourable to health; also that high wages have led many to refuse sanatorium or other systematic treatment and to the employment of large numbers of semi-invalids.

For the moment my only comment is to point out how these remarks emphasise the dependence of tuberculosis mortality on environment rather than on infection.

Since 1911 the number of beds available for the treatment of tuberculosis, supposed to be in the main sanatorium beds proper, has doubled, and is now 11.893, as against 5500. A high proportion of the patients in these beds have been of what is known as the hospital type, which are defined as cases of advanced disease or of chronic consumption often requiring prolonged treatment, especially at the request of the medical officers of the institution. Not infrequently the same bed is occupied by a single patient for six or nine months who should have been replaced by earlier cases. Tuberculosis dispensaries have increased over twelve-fold in the same period, from 25 to 30 in 1911 to 371 in 1917.

THE LANCET on Oct. 20th called attention to certain criticisms suggested by the collation of this greatly increased activity in measures supposed to be directed towards the administrative control of tuberculosis with the increased mortality experienced.

ADMINISTRATIVE METHODS.

Those interested in departmental explanations and deductions should study the report carefully. A large part is devoted to meeting such criticism as was inevitable. I think the key to what seems to me to be a confusion of ideas in the report is to be found in what I regard as one of the most dangerous doctrines in modern public health administration—namely, the statement made therein that measures for the treatment and prevention of tuberculosis are to a large extent identical. This doctrine, if by treatment is meant therapy, is capable of indefinite extension in this and many other diseases. If adopted generally it could only have the effect of placing our great liberal profession of medicine entirely and permanently under red tape rule. It grieved me to hear Sir William Osler support it in regard to syphilis when he delivered the Lettsomian lecture in this room. If treatment does not mean therapy, the allocution is to my mind mere phrase-mongering.

I cannot conceive that treatment and prevention should be regarded as identical. The former is our daily ambulance work, dealing with the units of mankind, and therefore possessing and demanding the greatest human interest. The latter is a matter of strategy and large ideas, ignoring the units and demanding the cold forces of bureaucracy. Many recent developments in the control of clinical work by various departments, arising out of ill-considered agitations, are, in my opinion, leading or likely to lead to a lack of progress in medicine, by creating stultifying cul-de-sac medical occupations, the accumulation of enormous masses of almost useless reports, and a smug complacency in their publication.

Treatment may some day be coördinated with public health work, factory and school work, under a Ministry of Health. At present we see a series of different authorities trying to strengthen their hold on the practice of medicine. Some will, no doubt, in time produce the inevitable statistics of the number of cases treated. Such statistics may unwisely be regarded as partly justifying a claim for expansion into a ministry, endowed with powers over other pre-existing authorities. I hope the coming Ministry of Health will be a bigger and greater thing that the result of inter-departmental rivalry with the winner on top.

No better test subject of administrative methods could have been selected for discussion than the part played by the sanatorium in the control of tuberculosis. It involves a study of its value and limitations both on the clinical or therapeutic side, in relation to the individual patient, and on the preventive or administrative side in relation to the community. It is upon the Fellows of this society and upon those who will collaborate with them to-night and at the subsequent meeting that the onus must fall of making the discussion valuable. I look to those who will follow and correct me to bring forward a diversity of opinions worthy to place before the Medical Society of London and its distinguished President. On no possible subject would it be easier to raise wide issues. Whenever resistance to the temptation to digress becomes impossible, the remedy lies in the hands of the President himself. I have no doubt his kindly warning will suffice to bring us to our proper bearings.

Having thus divested myself of all responsibility as to the value and limitation of the discussion, I will endeavour to put before you some of the questions that seem to call for expressions of opinion. My shortcomings are acknowledged in advance, and I hope that any point overlooked, which comes within the scope of our subject, will be brought forward by those having greater knowledge.

When I asked myself what I thought of the value and limitations of sanatorium treatment I hesitated and was lost in subsidiary questions. These concerned the position of the sanatorium in its therapeutic uses on the one hand, and its national value on the other.

THE VALUE OF THE SANATORIUM IN THERAPY.

1. Selection of cases.

The careful prognostic selection of cases for sanatorium treatment suggested an attractive chain of reflections until I remembered that experts accustomed to handle every group would be here to place before you actual experiences. From them we shall learn how best to advise patients of any clinical and social class who may be in doubt as to entering a sanatorium.

I may be permitted to maks one comment. Though the reaction of the human organism to pulmonary tuberculosis is the chief guide in estimating the possible results of sending patients into institutions, we must take into account their

existing environment. Other things being equal, benefit will accrue from sanatorium treatment in proportion as this supplies a better environment. It is impossible to overestimate the importance of the physician in charge of a sanatorium as part of that environment. I think we shall benefit any suitable case by so much as we are able to improve management and hygiene. I seem to have seen better results from sanatorium treatment in certain bad cases, classified according to the academical rules, when they have come from the industrial group, than in certain good cases coming from what one scarcely dares to call nowadays a higher social class. The industrial patient sometimes gets a better chance because he gets a bigger change.

Whether this belief is justified or not we shall learn during the discussion. We shall be glad to hear all who will speak to us with authority as to the effect of selection of cases on the value and limitation of sanatorium treatment.

SANATORIUM THERAPY AND TREATMENT AT HOME.

The relative value of treatment at a sanatorium as compared with treatment at home arises as a natural sequence of the consideration of selection. About a year ago I asked a senior lecturer on medicine at a great London school what he taught students on this point. He replied that he met inquiries with the somewhat humorous dictum that a sanatorium is a very suitable place for consumptive paupers or fools. There is a germ of truth in the first half of his selection. Not seldom have I met with a private medical attendant who has warned patients against going into a "hotbed of the disease." Occasionally I have allowed my opinion to be biassed by a patient or a doctor in whom I have had confidence, so that I approved of treatment at home. Usually, after taking precautions to secure adequate home treatment I have had reason for regret. Perhaps the precautions were not adequate. Possibly some of these cases, even if sent away, would have ended as sanatorium failures. All the details which make up the routine of the health re-education of the consumptive must attain to a higher power in the sanatorium. Compared to home treatment, there is as much difference as between a thorough school education and a few interrupted private lessons.

But I think too much is sometimes claimed as the result of the institutional training of patients. The patient nearly always thinks in terms of treatment and cure. The lessons learnt are more often than not, like those learnt at school, largely forgotten after the leaving examination. The short educational treatment in sanatoria of the industrial class of patient is even a greater failure. Few medical officers are able to impress upon dull minds any reasonable view of the nature and needs of this disease in four or even 12 weeks. This is not to be wondered at, seeing that a medical qualification and years of general clinical work only too often fail to do so among ourselves. The skilful private health-tutor is a rare bird. The born leader and teacher is not found even in every sanatorium.

The time devoted to sanatorium treatment should be much longer than it usually is for every class of patient. It need not necessarily be in the same institution throughout the whole period to secure the best results. To follow up sanatorium treatment at home successfully requires the highest self-discipline, a quality not more conspicuous among consumptives than among others. Hence I do not attach much value to the "rabbit hutch in the back garden" type of home treatment.

Home treatment demands self-training and self-discipline even more of our own profession than of the patient. To emphasise the value of open air is a good thing, but it is only a small part of sanatorium therapy. Continual scientific guidance by a trained medical man is an essential concomitant before much is to be achieved clinically. Home treatment and after-treatment suffer from the lack of thorough teaching of common diseases. An adequate knowledge of these should be an essential requisite in qualifying examinations. The General Medical Council could do more by amended regulations than all the private and public machinery set up hitherto for the treatment of tuberculosis.

Home treatment before and after sanatorium treatment has a powerful effect on results. It is possible to argue that sanatorium treatment can be carried out at home. But those capable of carrying out sanatorium treatment efficiently are even rarer in domestic practice at present than in institutions. Hence arise the frequently expressed aspersions on the general practitioner and the setting up of an ever-increasing series of costly contrivances, such as tuberculosis officers, dispensaries, care committees, and after-care colonies. The original value that might have been ascribed to the tuberculosis dispensary seems to me to have become obscured by its clinical expansions. I will refer again later to these, but here I will only say that sanatorium treatment cannot, as a rule, be carried on at home because neither the home nor the treatment available is likely to lead to success. This is, of course, only a broad statement referring to the mass of disease and the majority of homes where it occurs. I do not ignore certain excellent experiments.

Statistical Data.

The value of sanatorium treatment in comparison with home treatment might, perhaps, be estimated by results. These results may deal with the conditions at the end of treatment or with the after-history.

Of the results at the end of treatment I do not know of comparable statistics. Sanatorium statistics should be studied with philosophic doubt. I trust that when we hear the figures relating to immediate and remote results from those speakers who will produce them we shall not let this doubt diminish the importance of the lessons to be drawn from them. The doubt in my mind at the moment arises from a lack of knowledge of successful results when cases are not treated in sanatoria. We cannot ignore pathological evidence. Healed lesions without a history are commonly found. "Everyone has his tubercle." Some seem to have had a good deal and yet recovered to die of something else.

I would like to know, first, the recovery rate of untreated cases classified according to the academic rules. Are there not many cases that would get well anywhere, even, if it exists, in a badly managed sanatorium? I would like to know what margin of sanatorium successes really exists over and above the unknown recovery rate of each group. As I cannot know I may be permitted to doubt. I will allow a large margin. Secondly, we want careful practitioners, not addicted to the "hotbed of disease" prejudice, to tell us how many cases get well when treated at home. Is there no James Mackenzie of Tuberculosis? If there be many such cases one appreciates and sympathises with the desire of sanatorium doctors to get their patients in the earliest possible stage. Early cases must furnish the best recovery rate, whether untreated or treated at home or at the sanatorium. Improved statistics increase the moral force of the object-lesson afforded by the sanatorium, and are therefore desirable. Thirdly, I would like to ask whether financial considerations do not sometimes prevent patients from receiving full benefit from sanatorium treatment? As to comparative cost of home and sanatorium treatment there is much to be said by those speakers who handle various groups of patients. I should say that efficient home treatment was more expensive than at the sanatorium. The high comparative cost of sanatorium treatment is, I think, largely apparent and not real if anything like the same advantages are to be furnished at home. There is one difficulty which applies to all members of the community dependent for a living on their own efforts, and that is the prolonged absence from home required by adequate treatment in a sanatorium. This can only be overcome, or rather palliated, by doing one's best for as long as the patient can remain and trying to secure sympathy and understanding from the patient of what one is doing and teaching. For cases that are improving sanatorium treatment is more often cut short against the wishes of the doctor in charge than not. This desire of the sanatorium doctor to get the best results for his patients is used as an argument in the Local Government report for the earlier discharge of cases to enable them to be replaced by more responsive patients. This seems to lead us back to the difficulties arising from public and professional ignorance. The early case is difficult to get hold of.

Of the results of the after-history of sanatorium cases we hope to hear figures during the discussion. It seems to me that the justification of the sanatorium by the after-history of the patients is an eminently important thing to establish. Personally I have been rather depressed by the after-history of sanatorium patients, even when discharged from institutions as "arrested." The same deductions ought to be made from the list of successes as were suggested for the immediate results. In my experience after-history largely depends on opportunity. Where patients must go back to the same

houses, habits, and haunts wherein they previously lost their resistance they will lose it again. Very few patients can or will change their environment and occupation afterwards. If the occupation were conducted in such a manner and the general environment were such that the resistance regained were not lost the after-history would be better. It seems clear, therefore, that it would not have been lost had these conditions existed before the patient lost his resistance to the disease. Other considerations, of course, arise, but I think most sanatorium doctors would agree that some of their best efforts are ruined when the patients leave. We shall be glad to hear their views.

SPECIAL TREATMENTS AS AIDS TO SANATORIUM THERAPY.

We may ask ourselves whether the value of sanatorium treatment can be increased by the various special "treatments" that have been introduced. More remotely we might suggest that some of these methods may properly be used to replace the sanatorium altogether. Not yet.

A number of special treatments have been introduced from time to time. There are certain points of unanimity in the desires of those advocating special methods. They like to secure very early cases, and they urge the necessity of hygienic methods being employed as accessories. There seems to be a considerable amount of uniformity in the successes obtained in corresponding classes of cases, provided the hygienic or sanatorium method is not omitted. I will not say this is a suspicious circumstance, but I return to my confession of ignorance as to the recovery rate of corresponding groups of cases however treated or untreated. I fear that the public clamour for "cures" may sometimes lead to biassed views among those of us who use special methods.

The late Sir James Goodhart said once that when we come in contact with those who advocate "treatments" we are liable to find ourselves in queer company. This opinion was shared, but differently expressed, by Sir Samuel Wilks. We may perhaps regard the hygienic method of raising resistance as a mere accessory. But I think most of us would say that we have sometimes seen it as the principal factor in the achievement of the results ascribed to special methods, and that these "treatments" are doubtful aids.

I think we should all like to know where we stand in regard to the use of tuberculin. Is the value of the sanatorium method increased by using any of the derivatives of the tubercle bacillus? If so, what are its uses in the many cases of mixed infection, and the relatively few cases where a pure infection can be reasonably inferred?

The association of vaccines for mixed infection, with tuberculin, is a difficult, costly, and complicated business. The very few "successful" lung cases I have seen treated thus are all dead of their disease. Possibly others have had a more fortunate experience. If this is so then these things should be used more largely than they are at present in sanatoria. Personally, I consider that such methods are only adapted for a very small proportion of the total mass that come before us in institutions, that they are better carried out there under full control than in the consulting room or home, except under rare conditions, and that therefore the value of sanatorium treatment can be little affected by them.

Arising out of the use of tuberculin is the question of the precise value of that part of sanatorium treatment which is called auto-inoculation. Is this theory firmly based? What is the actual process, compared to the use of any of the known varieties of derivatives of the tubercle bacillus?

SANATORIUM THERAPY AND DIET.

Closely connected with the increase of resistance that one sees as the result of sanatorium therapy, whether accompanied by the use of vaccine, tuberculin, or auto-inoculation, is the nutrition of the body. May not the carefully planned food scale of the sanatorium, with general attention to digestion, rest and exercise adjusted to meal-times, account for many of these alleged successes? I will not enter into the question of the attention given to nitrogenous food. We know very little about the hæmatology and metabolism of these patients. Did we know more we ought perhaps to re-classify our cases in the light of such knowledge before we can ascertain the real value of sanatorium treatment. There must be some proportion of patients in whom an improved dietary properly regulated is sufficient to turn the scale in the right direction. There must be some in whom improved nutrition, and, if we like to say so, consequent formation of immunising bodies is impossible because of an original fault in their bio-chemistry. If this is so, deductions must be made from the successes on the one hand and from the failures on the other before we can have a real knowledge of the value of the sanatorium.

A more practical question is occasional difficulty arising from the food in a sanatorium being badly cooked, badly served, and, from ignorance of, or lack of sympathy for, human weaknesses, from an unnecessary monotony in the daily menu. For the convenience of the staff and store room there is a melancholy recurrence of the same food after the same intervals in some sanatoria. Loss of interest and loss of appetite result. Patients, staff, and doctors often become institutionalised. There is always a risk of deterioration in official clinicians.

As much as in any other detail the personality and knowledge of the medical officer is all-important in matters of diet. But apart from extreme methods such as zomotherapy, now practically out of date along with over-feeding and excessive milk drinking, diet is part of the general hygienic method.

SANATORIUM THERAPY AND FAMILY HISTORY.

The value of sanatorium treatment as affected by family history may conveniently be considered after these questions of nutrition. In the sanatorium inherited habits of unbalanced feeding can be adjusted in the same way as other errors. Diet is often a matter of family tradition. Further, we know that a type of bio-chemistry is as readily inherited as a blue eye or a pug nose. The manner in which a family resists or succumbs to tuberculosis is of great importance in prognosis. There are patients in whom recovery seems to be hopeless when the disease is once developed because of the strain from which they were bred. Is not this question of importance in making deductions from the figures of failures when we attempt to make a valuation of sanatorium treatment? Vice-versa, is not a history of family recovery of equal importance? The adjustment of sanatorium statistics as compared with other modes of treatment seems to me to demand many difficult and complicated inquiries.

SANATORIUM THERAPY AND PHARMACY.

Another matter in which the value of sanatorium treatment is difficult to assess is the importance to be ascribed to the use of drugs. So far I do not see much difference in the results attained by those who give much or little medicine, whether by the mouth or in other ways. I do not mean the use of medicine for intercurrent conditions but only such as are claimed to have a special effect on tuberculosis. He would be a bigot who, because a patient was in a sanatorium, would deny him such help as could be afforded by pharmacy for ailments properly so treated elsewhere. I need not discuss the many drugs that have been used. The legion of derivatives from creosote have almost succumbed to the absence of the German sample post. Creosote itself is still variously used. The so-called nascent iodine treatment seems to be not all that was hoped. I am told by those seeing it in use alongside control cases that there are no reliable contrasts. The presence of latent syphilis should be excluded before ascribing any improvement under this method to its effect on tubercle.

The true position is that drugs are accessories to the hygienic method and not the converse. The advocated remedies seem to have their entrances and their exits. Unless I am misguided, the hygienic method remains of the same value, whatever that may be, with or without them. It will be useful to learn from those taking part in the discussion how much importance they assign to pharmacy in achieving their results.

CONCLUSIONS AS TO THE VALUE AND LIMITATIONS OF SANATORIUM TREATMENT.

There are no doubt many questions which I have omitted in trying to point out the difficulty of assessing sanatorium treatment. I trust these will be recognised.

Meanwhile I will say that the value of the institutions clinically lies: (1) In the persons of their medical officers who can devote a relatively greater degree of special skill in management to their patients than they can usually get at home; (2) in their surrounding and equipment which offer a relative degree of greater hygienic protection; and (3) in their facilities for affording a better health education.

Their limitations arise from (1) certain deficiencies in medical education; (2) what may be called the lack of a

health conscience among the people; and (3) economical consideration.

THE SANATORIUM AND PREVENTION.

Coming to the position of the sanatorium in the preventive campaign I fear I shall be guilty of even more sweeping generalisations as a basis for discussion than those I have made in appealing for enlightenment as to its clinical value. By prevention I shall imply the diminution of the national loss due to tuberculosis,

It is a very large question. It raises the issue of whether we are on the right lines in dealing with this disease by the continual multiplication of institutions for treatment. At the outset I would like to refer again to the report of the Local Government Board.

The report contrasts the acute infectious diseases with tuberculosis, but I think insufficiently. In regard to fever isolation hospitals it says:—

"Although these institutions may not have completely fulfilled expectations in the amount of reduction of infection secured, they have done great work in this direction and have made themselves indispensable under modern social and industrial conditions. In the acute infective diseases the onset of secondary cases occurs after a few days' incubation; in pulmonary tuberculosis there may be a latent period stretching over years, and cause and effect may be difficult or impossible to connect. ..... The bearing of these facts on the institutional treatment of consumption is obvious. ..... They cannot be institutionally treated continuously, even if they were willing, and there is no need for residential institutional treatment during the large part of their sick life, assuming that they follow out the simple instructions in which they have been previously educated, preferably in a residential institution. ..... The short term of stay in a sanatoria or hospital for tuberculosis is stated to render home supervision more efficient. ..... A large proportion of the infective lifetime of every consumptive and the whole of the lifetime of some consumptives will necessarily be spent at home, if possible with skilled supervision and domiciliary treatment. An essential part in the prevention of the spread of tuberculosis consists in housing patients under conditions in which they will not spread infection. Measures for securing that the consumptive shall not be a source of massive infection must be reconciled with this economic consideration."

Certain comments seem to follow on these sentences gathered from a report which I confess I have found difficult to follow in its deductions. For acute fevers I think we are prepared to agree that institutions *have* made themselves indispensable under *modern social and industrial conditions.* Are they indispensable in a disease with a latent period stretching over years? How is skilled supervision and domiciliary treatment to be secured under present circumstances and the prevailing conditions? From the very nature of things the tuberculosis officer and nurse can only deal with a fringe of the cases. The private medical attendant is largely untaught by those responsible for his professional equipment, and yet must deal with the great mass of domiciliary cases. There are certain reforms indicated here which if carried out would diminish the need for these costly institutions, admittedly inadequate to secure segregation, full treatment, and arrest of this chronic disease. I quoted earlier the statement in the report that treatment and prevention are largely identical. But the report itself states that "difficulties arise when the tuberculosis officer concerns himself with treatment while giving little attention to hygienic circumstances." I have said elsewhere that the tuberculosis officer would often be better employed in visiting, helping, and encouraging the medical practitioners in his district, than in visiting patients, examining contacts, and giving doles of medicine and what not at the dispensary. I am glad that a belated acknowledgment, so far as it goes, of the essential difference between treatment and prevention was thus recognised in the report. The tuberculosis dispensary sometimes reproduces the old chest hospital out-patient room too closely, the condemnation of which was one of the reasons for its multiplication. Sir Robert Philip in a recent letter to THE LANCET (Oct. 27th) once more called attention to the original purposes of the tuberculosis dispensary. I think he had reason.

In addition to the references already quoted from the report in regard to modern social and industrial conditions it is claimed that during the last 20 years—

"There has been increasing treatment and segregation of patients in Poor-law infirmaries and other institutions, who would otherwise have been under unsatisfactory domiciliary conditions, and that this segregation is largely responsible for the decline in the death-rate during the same period, notwithstanding increasing urbanisation and its associated relatively high mortality from tuberculosis."

Later, attention is drawn to the housing conditions of the people as revealed at the last Census of England and Wales, when 12·3 per cent. of the population lived in three-roomed dwellings.

Infection and Environment.

I suppose the implication is that institutional treatment, with all its drawbacks and with its increasing control of clinical work under Local Government Board conditions, is easier to develop than improvement in social and industrial conditions. One may be grateful for the facts without accepting the inferences in the report.

Surely pathology and morbid anatomy have proved to the satisfaction of students of tuberculosis that the bacillus is a comparatively harmless pest to the great majority of us. Urbanisation has been shown to be associated with an increased relative mortality, and therefore inferentially increased morbidity, but it has also been shown to be associated with the fall of the death-rate in urbanised countries. Mankind is reacting to the dissemination of tubercle. Dr. Mott once said that civilisation is syphilisation. It is certain that urbanisation is tuberculisation. The gradual fall of the total death-rate is, I think, due to the creation of a race resistant to tuberculosis by the ruthless methods of Nature. Perhaps these methods have involved prophylactic infection.

If you were to assist Nature there is, perhaps, more to be said for prophylactic inoculation than for increased institutionalism in this disease. Tuberculosis is not only a latent condition in individuals, but a latent disease in communities. Morbidity and mortality have surely been proved to be independent of the mere fact of the occurrence of tubercle infection. A great mass of the loss from the disease as shown by morbidity and mortality has as surely been proved *ad nauseam* to be due to social factors.

In the majority of cases sanatorium treatment suffers in the public estimation because the resistance which may have been regained is more or less rapidly lost on a return to the old surroundings. We may plead for better domiciliary treatment and for a larger number of skilled supervisors, but our hands are tied by the lack of local and central concentration on environment in the fullest sense of the word.

Private practitioners tell you that their hands are also tied, and sanatorium medical officers are always regretting the difficulties of many of their patients on leaving the institution. The general practitioner knows what all students of the morbidity and mortality of tuberculosis also know. The Local Government Board has supplied us with invaluable material. We have only to study the many district maps that have been made of the incidence of mortality, or to analyse the occupational figures supplied in the decennial reports of the Registrar-General, to be convinced of these facts. Clinical experience affords a few exceptions to the general rule. These may be due to various causes in individual instances. But I have no doubt that if the truth were known they could, so far as infection is concerned, be traced to the constant supply that comes from herded but motile consumptives.

How can treatment at any number of institutions prevent national loss from a disease the occurrence of which, *as a disease*, is due in the main to factors other than infection. I have the gravest doubts of the value of trying to control a leak by swabs, or of winning a campaign by any system of hospitals and ambulances.

Dependence of Tuberculosis Problem on Social Factors.

The value and limitations of the sanatorium in regard to prevention lie in a much bigger consideration than the multiplication of their number on a false analogy with the acute infections, however qualified.

The real value of the sanatorium lies in the fact that it has demonstrated how resistance is regained. Inferentially it demonstrates, therefore, how it was previously lost. There has been a lack of recognition of its real significance. It presents the contrast to all those conditions which bring about loss of resistance. The sanatorium furnished its object-lesson long before the tuberculosis dispensary was originated. The lesson was not grasped. The tuberculosis dispensary should have been created and developed in every

district as an efficient bureau of information: it has become too much of a clinical centre. It is a peculiarity of vicious circles that they necessarily tend to enlarge. There seems to be no end to the vicious circle that has been grafted on to the tuberculosis dispensary. It has become the centre of a whole series of ever-extending clinical efforts. As Sir Robert Philip truly says, these, the sanatorium, the hospital, the tuberculosis school, the farm colony, the care committee, &c., are well known. There are not nearly enough of them yet if we are to continue to be obsessed with the need of fighting infection and to forget the relative harmlessness of this acid-fast bacillus in comparison with the other factors in the disease, against which this clinical work is not only a merely palliative measure but a very powerful demonstration.

The present increase in the mortality of tuberculosis I believe to be temporary and to afford no evidence in particular of the value or worthlessness of the present administrative measures, including increased sanatorium beds and manifold dispensaries. But it emphasises the dependence of the tuberculosis problem on social factors. It is these that require investigation and appropriate measures. No amount of institutions will affect them. I think the present increase in mortality will be followed eventually by a more rapid fall in the death-rate. I do not think this improvement will be apparent at once, nor do I think that it will be long delayed. I am sure it will be ascribed in reports to whatever administrative measures are undertaken. If it occurred after a campaign, however begun so long as it was consistent, against the conditions which we know definitely to be associated with high local or occupational death-rates, I should myself claim the improvement to be due to the object-lesson afforded by the sanatorium.

There is a long way to go yet, but the sanatorium will have achieved its full value, and that will be unlimited, when everyone lives and works under sanatorium conditions and every practitioner of medicine is a sanatorium doctor.

TARTAR EMETIC IN TREATMENT OF MALARIA.

BY A. W. FALCONER, M.D. ABERD., M.R.C.P. LOND.,
MAJOR, R.A.M.C., T.F.;
AND
A. G. ANDERSON, M.D. ABERD., M.R.C.P. LOND.,
CAPTAIN, R.A.M.C., T.F.

IN view of a paper by Sir Leonard Rogers[1] the following eight cases were treated intravenously with tartar emetic. They were treated during February, 1917, and include infections both with benign and malignant tertian parasites. All had a previous history of attacks of malaria. During this period, though relapsing malaria was frequent, it was clinically of a mild type and responded well to treatment with quinine by mouth. The cases chosen for treatment with tartar emetic were selected in so far that only those showing a fair number of parasites were taken. In all some 12 cases were selected for treatment, and the results of eight of these are published in detail.

The tartar emetic was used in 2 per cent. solution, with which ½ per cent. carbolic acid was added to preserve its sterility.

CASE 1.—Private G., aged 21, 15 months' service in Salonica. Reported sick 17/2/17, complaining of pains in left side, shivering attacks, and dizziness. There was a history of a previous attack of malaria in July, 1916, and several minor attacks since. On admission his general condition was fair, his temperature normal, his pulse 60, and his spleen was not palpable. A blood film showed subtertian crescents. Treatment by tartar emetic was started on the day following his admission.

After the second febrile attack the patient was placed on treatment with quinine by mouth.

Day.	Blood examination.	Treatment.	Condition.
11	Seven crescents seen.	2 c.c. 2% T. emetic.	—
12	One crescent seen.	—	No pyrexia.
13	,,	2 c.c. 2% T. emetic.	,,

25	—	—	,,
26	Numerous B.T. parasites seen.	—	T. 102·4° F.
27	B.F. negative.	—	No pyrexia.
28	Very numerous B.T. parasites seen.	—	T. 99·8° F.

CASE 2.—Corporal S., aged 32, admitted to hospital on Feb. 15th, 1917. Reported sick on 3/2/17, complaining of attacks of shivering, vomiting, and pains all over. There was a history of a previous attack in July, 1916, and 10 or more slight attacks since that date, the attacks recently becoming more frequent. On admission his general condition was good, his temperature normal, pulse 90, spleen hard, tender, and palpable, one finger's breadth below the costal margin. His blood showed subtertian crescents and small ring forms.

In spite of the disappearance of the parasite from the peripheral blood stream, yet there were moderately sharp relapses, after which quinine treatment was started.

35	,,	—	,,

CASE 3.—Lance-Corporal B., aged 21, 14 months in Salonica. Admitted on 18/2/17, having reported sick a week previously, complaining of shivering, headache, and temperature rising to 103° F. There was a history of a previous attack of malaria in June, 1916. On admission his general condition was fair, tongue clean, temperature normal, pulse 80, and spleen not palpable. His temperature remained normal for a week after admission and then rose to 104°. A heavy infection with B.T. parasites was present in blood.

In spite of tartar emetic the parasites persisted in the circulation, and a week after the last injection of 8 centigrammes of tartar emetic the patient had a typical attack of malaria with temperature rising to 104·6° F. He was placed on sulphate of quinine 20 grs. three times a day by the mouth with progressive improvement.

CASE 4.—Corporal C., aged 41, 15 months in Salonica area. The case was admitted to hospital on 17/2/17 for observation on recommendation of medical board. There was a history of a previous attack of malaria

[1] Brit. Med. Jour., Jan. 6th, 1916.

in August, 1916, which had caused him to be invalided to Malta. He returned from Malta in October to this command, and in January, 1917, was again admitted to hospital. He did a week's duty and was admitted again to hospital. On admission his general condition was poor, he was anæmic and cachectic looking, the temperature was normal, the spleen not enlarged. The day following his admission he had a typical attack of malaria, with temperature rising to 103° F., and benign tertian parasites present in the blood.

Day.	Blood examination.	Treatment.	Condition.

Five days after the last injection of 4 c.c. of tartar emetic his temperature again rose to 103° F., and benign tertian parasites reappeared in the blood stream. He was placed on 20 grs. of quinine sulphate three times a day by mouth. The temperature remained normal, the parasites disappeared, and on the 14/3/17 he was discharged to hospital ship.

CASE 5.—Driver W., aged 21. Twelve months' service in Salonica area. He reported sick on 11/2/17, complaining of shivering attacks and pains all over. There was history of previous attacks of malaria since May, 1916. On admission he looked anæmic and ill, temperature normal, pulse 104, and spleen palpable one finger's breadth below the costal margin, but not tender. He complained of pain in the toes when the feet were warm. On the dorsal surface of all the toes on both feet were small irregular areas dark in colour, and all partially anæsthetic. Similar changes in the feet had been observed previously in three cases suffering from severe malaria, and have already been reported elsewhere.

Day.	Blood examination.	Treatment.	Condition.

39	B.T. + (scanty).	—	,,

In this case the tartar emetic had no effect in causing the disappearance of the parasite or in preventing clinical relapses. The condition of the feet gradually cleared up. He was placed on quinine sulphate by mouth, and ultimately was discharged to hospital ship.

CASE 6.—Sapper B., aged 26, 15 months' service in Salonica area. Reported sick on 10/2/17, complaining of shivering attacks and headaches. Admitted to base hospital on 15/2/17. There was a history of one previous attack of malaria in August, 1916. On admission his general condition was fair, temperature normal, pulse 76, spleen not palpable. On the day after his admission he had a typical attack of malaria, with temperature of 101·4° F., and blood film showed a heavy infection with benign tertian parasites.

For some days after the last injection of 4 c.c. tartar emetic the blood film became negative, but again became positive after three sharp rises of temperature. In spite of the tartar emetic this case showed a mild degree of almost continuous pyrexia interrupted by sudden elevations of temperature, which did not yield until quinine was administered. The spleen also, which was not palpable on admission, became definitely tender and palpable during the period when tartar emetic was being administered. He was ultimately put on quinine by mouth and discharged to hospital ship.

33	B.F. negative.	—	,,

CASE 7.—Private H., aged 24, 15 months' service in the Salonica area. Reported sick on 11/2/17, complaining of attacks of shivering, sweating, headache, cough, and fever. He was admitted to base hospital on 18/2/17. In July, 1916, patient had his first attack, and was sent to Malta for three weeks. On admission to hospital his general condition was fair, but he looked anæmic, pulse 80, temperature 99° F., and spleen definitely enlarged, hard and tender. Benign tertian parasites were found in the blood films. In spite of five injections of tartar emetic, 28 centigrammes in all, the parasite persisted in the film, and the patient had repeated bouts of fever. Ultimately he was placed on 20 grs. of quinine sulphate three times a day by mouth, with the result that the temperature became normal, his blood film negative, and remained so during the rest of his stay in hospital.

Day.	Blood examination.	Treatment.	Condition.

28	,,	—	,,
30	,,	—	,,
31	,,	—	,,

CASE 8.—Private R., aged 21, reported sick on 15/2/17, complaining of weakness and attacks of shivering. Admitted to base hospital on 17/2/17. The primary attack of malaria had occurred in October, 1916, and from that time the patient had had attacks almost every week. On admission his general condition was poor, anæmic, temperature 105·6° F., pulse 114, his spleen hard and extending three fingers' breadth below the costal margin. His blood showed subtertian crescents and rings.

Day.	Blood examination.	Treatment.	Condition.
1	Subtertian crescents and rings.	—	T. 105° F.
2	—	Quin., 20 grs. t.d.s.	T. 99·4° F.
4	—	1 c.c. 2% T. emetic.	T. 98° F.
5	Benign tertians only.	—	No pyrexia.
6	—	2 c.c. 2% T. emetic.	,,
7	Blood negative.	—	,,

From the time of the last injection of tartar emetic the blood film remained negative till the patient's discharge from hospital. He had, however, two attacks of pyrexia, the temperature on each occasion rising to 101° F. The spleen did not diminish in size and he was ultimately discharged to hospital ship.

Of these eight cases there were two mixed infections (Nos. 1 and 8), one subtertian malaria (No. 2), and five benign tertian malaria (Nos. 3, 4, 5, 6, 7), three of which showed gametocytes.

Of the two mixed infections, the crescents disappeared in both cases, the benign tertian parasites persisting in one and disappearing in the other.

In the subtertian crescent infections the crescents disappeared after three injections of tartar emetic. In spite of the disappearance of the crescents the patient had three typical clinical attacks of malaria, though the parasites could not be demonstrated again in the peripheral blood stream.

Of the five benign tertian infections, in none did the parasites disappear from the blood stream till large doses of quinine had been administered.

In the three cases where gametocytes were seen, in two the gametocytes were not found subsequent to the tartar emetic treatment, in the other case the gametocytes persisted.

Neither in the subtertian cases, nor in the benign tertian cases, was any marked clinical improvement noted, and certainly in the benign tertian cases the tartar emetic did not appear to exert any effect whatever on the parasites.

The results coincide with those of Low and Newham reported in the *British Medical Journal* of March 3rd, 1917, and the results of cases treated in other hospitals, and were so disappointing that we did not feel justified in continuing the observation.

THE MORTALITY FROM POST-CHOLERAIC URÆMIA:

A 70 PER CENT. REDUCTION THROUGH INTRAVENOUS INJECTIONS OF SODIUM BICARBONATE.

BY SIR LEONARD ROGERS, KT., C.I.E., M.D. LOND., F.R.C.P. LOND., F.R.C.S. ENG., F.R.S.,
PROFESSOR OF PATHOLOGY, CALCUTTA.

I HAVE already recorded a great reduction in the mortality due to post-choleraic uræmia during 1915 through the routine intravenous injections of bicarbonate of soda in all severe cases of cholera,[1] based on the proof by Captain A. J. Shorten, I.M.S., and myself,[2] that an acidosis is an essential feature of severe cholera. As these favourable results have now been confirmed by a much larger series of cases during the last three cholera seasons in Calcutta, which can be compared with the data of three years before the use of the alkaline solutions in the same wards, it appears to be advisable to place them on record.

Statistical Evidence.

As early as 1893 Wall, in his book on cholera,[3] used a very small quantity of sodium bicarbonate (0·2 per cent.) in his weak saline solution (0·4 per cent. of sodium chloride) intravenously, and in 1910 Sellards[4] recorded having found that large quantities of alkalies might be given by the mouth in cholera patients without rendering the urine alkaline and suspected an acidosis. In 1914 he recorded[5] having obtained a great reduction in the deaths from post-choleraic uræmia by the addition of sodium bicarbonate to the saline solution used for intravenous injections. In 1915 Captain Shorten and I[2] recorded actual estimations of the alkalinity of the blood in 20 cholera patients, and showed that in fatal cases of post-choleraic uræmia it is usually reduced to the extremely low figure of N/100 or even less, when it is too late, as a rule, to save the patients even by alkaline transfusions. Later in 1915[6] I recorded alkalinity estimations in 62 cases, and early in 1916[1] gave the data of 104 cases treated during the previous year, which showed a reduction of the alkalinity to from N/45 to N/60 in no less than 76·9 per cent. of cholera cases, and to the extreme and dangerous degree of N/80 to N/100, or even less, in as many as 30·7 per cent. During 1915 the death-rate from post-choleraic uræmia was reduced to 2·7 per cent. from an average of 11·1 per cent. during the previous three years without alkalies—a remarkable improvement.

The following table gives the figures for the three years 1912–14 without alkalies, and for 1915–16 and the first half of 1917, which includes the cholera season in Calcutta, during which 70 per cent. of the yearly cholera cases occur:—

Total Cholera Mortality and the Deaths from Uræmia Before and After the Use of Alkalies.

Years.	Total cases.	Deaths.	Per cent.	Uræmia deaths.	Per cent.
Without Alkalies.					
1912	170	54	31·76	24	14·11
1913	200	49	24·5	17	8·5
1914	222	49	22·01	25	11·2
1912-14	592	152	25·6	66	11·1
With Alkalies.					
1915	226	39	17·22	6	2·64
1916	204	52	25·5	8	3·92
1917	154	24	15·6	5	3·2
1915-17	584	115	19·7	19	3·25

Reduction in the mortality from uræmia by alkalies 70·7 per cent.

The extensive data in the table so amply confirm my former results in a smaller series that they require very little comment. The reduction of the uræmia death-rate during the last two and a half years by 70 per cent. affords the most striking testimony to the importance of the proof that this serious complication of cholera is essentially an acidosis, which can moreover be largely prevented by the routine use of alkalies intravenously and by the rectum. It is worthy of note that more than half the few remaining cases of fatal uræmia in the last two and a half years occurred in patients admitted with suppression of urine of from one to three days' duration, too late to benefit fully by the alkaline treatment.

Method of Treatment and its Effects.

It may be well to state again my present routine regarding saline injections in cholera.

Two solutions are now used. The first is the hypertonic saline, which I have given with much success in well over one thousand cases during the last ten years. It consists of 120 grains of sodium chloride with 4 grains of calcium chloride to a pint of sterile water. For several years now I have omitted the potassium chloride of Ringer's fluid, as some physiologists regard this as an unnecessary and possibly depressant addition, and the increasingly favourable results obtained in recent years show that it is certainly not required. The second, or alkaline solution, contains 60 grains of sodium chloride and 160 grains (2 per cent.) of sodium bicarbonate, and is thus also a hypertonic fluid. To avoid decomposition of the bicarbonate on boiling, the chloride solution is sterilised before the bicarbonate is added, and the latter sterilised in packets in an autoclave and subsequently added.

In patients admitted early without prolonged suppression of urine the hypertonic sodium chloride solution only is used at the first transfusion, the quantity being regulated by the specific gravity of the blood as described in my book on cholera. If the case is sufficiently severe to require further intravenous injections, at each subsequent transfusion one pint of the alkaline solution is first given and followed by the hypertonic chloride solution in the quantity indicated by the specific gravity of the blood. In cases admitted late with suppression of urine for 12 hours or more the alkaline solution is given at the first injection as well. Moreover, it is used in all cholera cases with deficient urinary secretion without much concentration of the blood as shown by the specific gravity, in which the normal saline was formerly advised by me. As long as the specific gravity of the blood is not much below the normal, such as not less than 1050, a pint of the alkaline solution can always be safely given intravenously for deficient secretion of urine. In addition, this solution is now used in the place of normal saline by the bowel when formerly advised.

In a former paper[1] I gave details of several cases in which from 800 to 1120 grains of sodium bicarbonate had been injected intravenously in threatening uræmia in cholera, with recovery. The following remarkable case is also worthy of record.

Post-choleraic suppression of urine for six days, with re-establishment of the secretion after 1600 grains of sodium bicarbonate had been injected intravenously.—A man, aged 53, admitted for cholera of 29½ hours' duration, with suppression of urine

for 24 hours. Sp. gr. of blood 1055, blood pressure 50 mm. He was given 1 pint of the alkaline solution and 3½ pints of hypertonic chloride solution on admission, and in the course of six days received a total of 14¼ pints, of which 10 pints were the alkaline solution, containing in all 1600 grains of sodium bicarbonate, in eight intravenous injections. During one day before admission and five complete days in hospital he passed no urine, but on the sixth day in hospital 9 ounces were measured, followed by 20 ounces the next day, and then freely for three more days, during which the uræmic symptoms entirely disappeared. Unfortunately, he developed a septic arm after a hypodermic injection of pituitrin, the temperature rose to 102° F., and he succumbed to fever and exhaustion five days after the urinary flow had been re-established, his age being much against him.

I have been through my tabulated records of nearly 600 cases treated without alkalies from 1912–14, and find that no case of recovery occurred in which the urine had been completely suppressed for more than two days, while very few even of the fatal cases survived more than three days without passing urine. On the other hand, during the last two and a half years, under the alkaline treatment, it has been by no means rare for patients to be saved after complete suppression of urine for three days and over, but the above case of free secretion of urine after six days' complete absence is a record in my long experience of post-choleraic uræmia, which I have previously pointed out,[1] runs a much more rapid course than surgical forms of anuria without acidosis. It is of interest to note that shortly before the urine reappeared the alkalinity was found to have been raised to the high point of N/28 5.

Lastly, I may point out that the considerable further reduction in the mortality of cholera in my wards during the last two and a half years is mainly due to the decrease of deaths from uræmia as a result of the alkaline treatment as shown in the table. In 1916 an exceptionally large number of deaths occurred from collapse (namely, 19 per cent. against an average for the last 5½ years of 11 per cent.). This was mainly due to an unusually large number of admissions in a moribund state, the patients dying before transfusion could be completed, and of very old and feeble subjects. Nevertheless, the mortality during the last two and a half years among 584 cases has fallen to 19·7 per cent., or one-third of the rate in the same hospital before I commenced the hypertonic saline treatment, while during the first six months of the present year (in which the mortality is almost invariably higher than in the second half) the death-rate among 154 cases has been only 15·6 per cent., or one-fourth of the old mortality, a highly gratifying reduction of about 75 per cent. in the death-rate of this terrible disease.

Calcutta.

EPITHELIOMATOUS NEOPLASMS OF THE DORSAL ASPECT OF THE HAND.

BY CHARLES GREENE CUMSTON, B.S., M.D.,

PRIVAT-DOCENT AT THE UNIVERSITY OF GENEVA; HONORARY MEMBER OF THE SURGICAL SOCIETY OF BELGIUM.

THE origin of epitheliomata, like that of all malignant growths, is obscure, but these neoplasms, developing on the dorsal aspect of the hand, are usually preceded or accompanied by some local irritative process. These processes are trauma, the various dermatoses, osseous fistulæ, angiomata, papillomata, and cicatrices.

The Part Played by Local Irritative Processes.

Traumatism *per se* appears to favour epithelial neoformation, and in the case of the hand contused wounds are, in the patient's history and opinion, the origin of the lesion. The origin of the so-called professional epitheliomata, so common on the dorsal aspect of the hand, may be explained in this way, since burns of an accidental nature or from acids and caustics employed in certain professional occupations are frequent.

The dermatoses are often the starting point of epithelial lesions, particularly chronic eczema, psoriasis, and, above all, lupus. Ulcers have been recorded as the causative factor of these growths, and I believe that this is particularly true in the case of cutaneous cancroids.

Diseases of the bones of the hand may give rise to epithelioma of the skin on account of the continued irritation to which they give rise, but fistula developing in a bone is particularly prone ultimately to set up an epitheliomatous process, and a fair number of instances are known of pavement-cell epithelioma occurring in fistulous tracts of long standing.

Angiomata are well known for their tendency to cancerous change, although this is denied by some. Perhaps papillomata are the most constant process in the etiology of epitheliomatous growths on the dorsal aspect of the hand. At the start these epithelial productions are generally benign, but from repeated trauma or ill-advised treatment with caustics and the like, they assume malignant characters. All of these processes, no matter what may be their origin, may undergo such malignant transformation, and as they are frequently seated on the dorsal aspect of the hand their etiological importance is clear.

There are, however, epitheliomata whose origin is quite different which develop in tissues apparently healthy. Unquestionably all the causes that have been mentioned play a part in the origin of the malignant process, but this part is secondary only, and in all probability they merely awaken or accelerate the activity of certain pathologic productions which likewise develop from some inflammatory influence that is as yet an unknown quantity. These local causes in the development of epithelioma are neither absolute nor necessary, since this malignant growth can and does develop without them.

Nature and Development of the Neoplasm.

Epithelioma of the dorsal aspect of the hand appears to be a lesion of advanced years, the greater number of patients being from 60 to 70 years of age; but when the malignant tumour arises in a nævus this occurs more frequently between the ages of 30 and 40 years. This malignant process is said to be more common in the male, and undoubtedly this is true for the lips, cheeks, &c., but both cases to be here reported occurred in women. It has also been shown by Heurteaux that of all the cutaneous epitheliomata of the upper limb the dorsal aspect of the hand is the seat of the process in somewhat over 50 per cent. of the cases.

Epithelioma of the back of the hand commences usually by hypertrophy of a papilla, a tumefaction of the derma, or may be seated in a sudoriparous gland, and, according to the type, there will result a papillary or glandular dermic form, but it seems more than probable that the former is more frequent in the anatomical region considered in this paper.

The growth commences by a small verrucous production of hard consistency, its base being composed of a cluster of hypertrophied cutaneous papillæ. Then the verruca increases in size and at the same time becomes more vascular. It is apt to give rise to intense pruritus and excoriates and cracks. These crevices, by multiplication, at length result in an ulcerous process, giving rise to a serous secretion in which epithelial cells and pus cells are found. The epithelium next pushes its way between the papillæ and involves the dermis, which becomes the seat of a very marked cell proliferation. In the deeper structures the connective tissue becomes mixed with the epithelial cells and represents the area of invasion and of infiltration of the neighbouring structures.

As soon as the healthy tissue becomes involved and the epithelial productions penetrate the surrounding structures an inflammatory process of the integuments will be observed. The zone of invasion alone separates the neoplastic production from the healthy tissues, and from this time on the epithelial ulceration progresses in depth and extent.

In other cases the neoplasia forms masses which mingle with the connective tissue which it invades; its growth is dependent upon the surrounding structures; the muscles are invaded, their fasciculi being separated by epithelial growth. A number of epidermic globes are also present.

A process such as this is that of a neoplasm which is dry and whitish in hue and gives no juice when it is scraped; in other words, it is the lobulated pavement-cell epithelioma. Finally, the growth may be composed of long tubuli, resulting from the development in the gland tubules. This type is less common, and represents the tubulated pavement-cell epithelioma. The third and last type of the process

ıcountered on the back of the hand is the pearly pavement-
ıll epithelioma. It is the most uncommon of them, and
presents those growths which clinically remain stationary
r a considerable lapse of time. Horny, concentric cells
e only found, their power of invasion is slight, and if no
ritative process comes in play they remain quiescent.

Microscopical examination of the raised edge of one of
ese growths shows a tissue having the general appearance
a gland—that is to say, an irregular divisi n into large
bes, these divided in turn into lobules. The skin sur-
ınding the tumour shows no morbid change in the dermis
horny layer of the epidermis. The Malpighian bodies
er a marked extension, while the interpapillary depres-
ns are strongly evident. They dip down into the papil-
y tissue of the dermis, some of them becoming bifurcate
d club-shaped, in every way similar to glandular culs-de-
undergoing development.

From examination of numerous sections it would seem
ıt neither the sebaceous nor sudoriparous glands nor the
r follicles are the starting point of these epithelial forma-
ns, so that it seems clear that they are derived solely
m the prolongations of the Malpighian layer which exist
mally between the papillary projections of the dermis.
ar the growth, some of these prolongations are enlarged
their deep extremity which only reaches the middle
tion of the dermis, while others dip down into the midst
the dermis, reaching its connective tissue by extending
ond the papillary layer. They are also club-shaped and
composed of a pedicle attaching them to the Malpighian
y and by a deep-seated intradermic portion which is
kedly spherical at its extremity.

ıs to the tumour itself it offers the following structure.
lobules of the neoformed tissue are arranged in clusters
in chaplets, while in the centre of the large lobules
lermic lobules are seen formed in concentric layers,
the structure of an onion. Between these lobules the
nective tissue forms a network in the form of ramifica-
s, rich in vascular supply that accompanies the young
elements.

herefore, it may be logically assumed that anatomically
origin of the epithelial growth is entirely limited to the
rpapillary portions of the Malpighian body. The hair
cles and the sebaceous and sudoriparous glands take no
in the structure of the growth, and when they do exist in
preparation they are simply somewhat deformed from
sure of the growth. The retrogression of the neoplastic
ıents is due to an inflammatory process in the dermis
ı which the development of connective tissue results, and
connective tissue strangles the lobules of the tumour,
bringing about resorption.

Illustrative Cases.

SE 1.—Female, Irish nationality, 72 years of age and by occupa-
a charwoman. Widow for 15 years, two living children in good
h. She herself has always been well and robust. Examination of
ıcic and abdominal viscera negative.

out six years ago patient first noticed a small lump the size of a
ituated about the centre of the dorsal surface of the left hand.
s was some pruritus (probably due to an eczematous condition of
ikin) which caused her to scratch the part frequently. After a
the small lump took on the aspect of a wart which bled very
but was not painful, and this continued to develop slowly until
ondition to be described was reached.

e lesion on the back of the hand was almost exactly the size of a
ollar piece. It was almost perfectly circular. The edges were
and everted and raised to the extent of about 1·5 cm. The central
ated surface was covered with a dark-red granulation tissue
ı bled readily. There was a rather profuse, stinking, sanious
arge. The epitrochlear lymph node was very much enlarged and
Now lymphatics could be felt in the axilla, which could easily
t, because the patient was very thin. There was no evidence of
achexia, but pain was so intense that it kept the patient from
ng.

ular amputation at the lower third of the arm was done, the
ıt making a rapid and uneventful recovery. Her niece informed
riter that the patient lived comfortably for about four years and
from some pulmonary affection. I assume, however, from the
ıld by the niece, that death was presumably due to pulmonary or
ıl metastases.[1]

E 2.—Female, 64 years of age, a Belgian housewife, seen in con-
ion with Dr. Lenoir. Hereditary and personal antecedents *nil*.
and lungs normal excepting a slight chronic bronchitis and
sema of the apices. Abdominal viscera negative.

al condition.—An exuberant growth on the dorsal aspect of the
hand seated in almost the centre. This process began by a small
e of dark-red colour about seven months before I saw the patient.
reason apparently the tumour slowly increased in size until it
reached the dimensions of a 50-cent piece. The central portion, which covered the indurated base of the ulcer, had a fungous look, reddish-yellow in colour, and bled easily. At first sight the ulcer might almost be suspected of being tuberculous in nature. The contours of the base were almost perfectly circular, the edges were somewhat raised and red and surrounded by a dark violet ring. There was no difficulty in the movements of the fingers, and only a little sharp pain from time to time in the ulcer.

The axillary and epitrochlear lymph nodes were enlarged and hard and rolled under the finger. That in the epitrochlear region was the size of an almond. No evidence of cachexia.

Circular amputation of the arm at lower third, cleaning out of axilla as in operation for cancer of the breast. Recovery uneventful. At the time of writing, May 12th, 1917, the patient is still in excellent health 17 months after the operation. Histological examination showed that the growth was a tubular pavement-cell epithelioma. The lymph nodes of the axilla and epitrochlear region offered the same type of morbid change.

Clinical Phases: The Pre-ulcerative Stage.

For practical purposes epitheliomata of the dorsal aspect of the hand can be considered in two clinical phases—namely, the pre-ulcerative stage and the stage of ulceration, although it must be understood that this division is schematical. Some of these growths remain as simple sub-epithelial tumours for years, while others, on the contrary, develop very rapidly. The two cases reported serve as excellent types of the two extremes.

The physical signs of the pre-ulcerative stage are those of a small tumour seated on the dorsal aspect of the hand, frequently over the metacarpal joints or in the ungual fold. The growth is more like an induration of the integuments than a tumour in the true sense of the word, the limits being difficult to define at the commencement of the morbid process. The induration may be flat or offer a projecting surface, and presents the important characteristic that it is intimately incorporated in the skin. If an endeavour is made to mobilise the integuments covering it, it at once becomes evident that the process is united with the deep layers of the epidermis.

Delbet maintains that one of the physical signs is the impossibility to outline distinctly the limits of the growth, the examiner being unable to detect where it commences or ends.

During the pre-ulcerative stage the skin is not perfectly normal, and has a dried, parchment, or orange-skin look, the indication of adhesion of the Malpighian elements.

The neoplasm often begins by a kind of cluster of hypertrophied papillæ resting on a common base and contained in an epidermic sheath. The process is composed by big granulations the size of a millet-seed; in colour it is greyish or rosy, and in its neighbourhood lines of a bright tint are seen, caused by dilated capillaries. At other times the process commences in the form of a rosy or greyish tubercle of very small dimensions projecting above the surrounding cutaneous surface, sessile, with an uneven, lobulated surface.

Less frequently, when the growth starts in a sudoriparous gland, the lesion presents from the start a surface limited by an undulated, sinuous, greyish-coloured rim of tissue.

The functional symptoms of the pre-ulcerative stage are not of much account. There is some pruritus if an old cicatrix or a wart is present, and scratching will hasten the development of ulceration. Pain is absent and functional disturbances likewise, unless the growth is seated over one of the finger-joints, but by far the most important of the signs is the involvement of the lymphatic system. It is a mistaken idea to suppose that this does not take place until after ulceration has occurred, because in the rapidly developing types of this morbid process the enlargement of the lymph nodes occurs early, and is for this reason an important element in the diagnosis.

The Ulcerative Stage.

The ulcerative stage must fatally arrive, and is merely a question of time. It occurs earlier in some growths than in others, particularly in the fissured and cauliflower types. The former type is common, and offers itself in the form of a crevice with clean-cut edges, without any tendency towards cicatrisation. Spreading of the borders is quite limited, but induration is marked. The edges often puff up, their external aspect becomes shiny, and the skin covering them becomes thin.

The edges shade off into the surrounding structures, while the induration cannot be limited by palpation. Small neoplastic nodules, disseminated over the edges, may be seen in the form of little grain-like bodies. The secretion usually small in amount, being a blood-stained, cloudy flui

[1] *Note.*—A very excellent water-colour taken before operation of this ism is in the possession of the Boston Medical Library, Boston, among a small collection of drawings presented to it by the some years ago.

This fissure type of the process is slow in evolution, but may be quite painful.

Quite different is the so-called cauliflower type of the process. The bottom of the ulcer is irregular, tomentous, and covered with indurated granulations which bleed upon the slightest provocation. In the sulci separating the granulations a magma becomes deposited, composed of coagulated blood, purulent serosity, and dirt. The magma is brownish in colour, contrasting with the red tint of the granulation.

When the ulcer has attained this stage it may at a given time present a tendency to excavate, the elements composing the bottom being progressively eliminated. The edges remain raised, forming a funnel-shaped process, surrounding a crater whose surface is not smooth.

The edges of this cauliflower type require a special description. They are thick, indurated like the remainder of the tumour surface. Their surface need not of necessity be ulcerated; the limits of the epidermis are irregular and at some spots the ulcer sends off a rather long expansion towards the periphery.

The borders may be sharp-cut on their outer aspect and are abruptly raised. They frequently overlap the surface of the ulcer, forming a rather deep, circular sulcus around it. The surrounding structures continue directly with the neoplasm and contain either indurated tracts, indicating extension of the growth, or isolated nodules whose neoplastic nature leaves no doubt.

The third form of epithelioma of the dorsal aspect of the hand is the ulcerating type. In this type the growth is not raised or only very slightly so, and this applies to the thickened edges. On the other hand, the bottom is hollowed out, the process develops in depth, and soon becomes adherent to the underlying structures.

The Course of the Lesion.

In all types of epithelioma of the dorsum of the hand the secretions are not usually very excessive, but that they can be so is amply demonstrated in Case 1. They are composed of a thick, brownish, sanious liquid, which easily coagulates on the ulcerated surface, forming a crust. If a trauma intervenes this crust falls, and a hæmorrhage, which may be severe, results. The cauliflower type is the one in which loss of blood is more frequent, as the granulations form large buds, while if the hæmorrhages recur often an extreme degree of anæmia results whose nefarious effect becomes coupled with that of the cachexia.

When the ulcerative process has developed pain of very intense character occurs and may be the principal indication for operation, as was the case of the patient in Case 1. It is, of course, due to the involvement of the nervous branches invaded by the neoplasm, and when the trunks of the radial or ulnar nerves are attacked by the malignant process the suffering is intense.

When the disease has extended sufficiently the movements are interfered with on account of the involvement of the tendons and bones.

The regional invasion of epithelioma of the dorsum of the hand includes the bones, tendons, nerves, and vessels. The epitrochlear lymph node may be metastatically involved early in the process, while involvement of the lymphatics of the axilla is almost always constant, at least when the affection is far advanced. When they have formed a mass in the axilla they press upon the vasculo-nervous elements, resulting in œdema of the upper limb and severe neuralgia. General visceral metastases have been noted.

Prognosis and Treatment.

Epithelioma of the back of the hand is a serious affair, but the gravity of the case varies with the type of the evolution of the neoplasm. When this is slow it may exist for several ye rs without giving rise to any marked disturbance. The cauliflower type offers the most rapid progress.

There is one point to which attention is directed, to wit: in cases arising in subjects of advanced years the senile crust, even when ulceration has taken place, may remain stationary for years without local extension of the process or involvement of the lymphatic system, and in these circumstances the patient attributes little importance to his trouble. Then suddenly, following a trauma or the ridiculous habit, both by the laity and only too often by the physician, of applying some form of caustic, the growth assumes a very rapid development, and this is also most marked in the lymphatics, so that cases which were localised become quickly inoperable and give vent to severe or almost fatal hæmorrhage.

The prognosis, therefore, is difficult to give in any degree of precision on account of the above-mentioned circumstances, but it may be said that local removal of the growth is almost sure to be followed by a recurrence which undergoes an even more rapid evolution than the primary neoplasm.

As to treatment I have little to say, as I am of opinion that when the epitrochlear lymph node is involved nothing less than amputation at the lower third of the arm with a free removal of the axillary lymph nodes and fat even when the former cannot be detected by palpation is the only interference worthy of consideration, providing the cachexia is not too far advanced and that the general condition of the subject fulfils the ordinary requirements demanded for a successful operation.

Radiotherapy, radiumtherapy, and fulguration in no way appeal to me from the viewpoint of sane surgical principles, but I must admit that I have had no personal experience with them in the pathologic process under consideration. If the process is an absolutely local one at the time the case first comes under observation, one of these methods might be tried on condition that time be not lost if a manifest improvement does not take place very soon after the treatment is begun.

Geneva, Switzerland.

Clinical Notes:

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

CASE OF TWIN PREGNANCY WITH ONE MACERATED FŒTUS.

Under the Care of

J. B. HELLIER, M.D. LOND., M.R.C.S. ENG.,
PROFESSOR OF OBSTETRICS, UNIVERSITY OF LEEDS; HONORARY OBSTETRIC PHYSICIAN TO THE LEEDS GENERAL INFIRMARY.

(From the Maternity Department of the Leeds General Infirmary.)

Case reported by PAT. A. H. EGERTON, *Maternity Clerk.*

Mrs. A., aged 28, mother of three children, summoned the maternity clerk on the evening of July 30th, 1917. She was first seen at 9.10 P.M., and was found standing in her room talking to some other women. She stated that she expected labour to take place in about six weeks. During the day (about midday), when washing some clothes, she had slipped and fallen backwards, giving herself what she called a "wrench." This was followed by an attack of abdominal pain, described as "dragging" and coming on in spasms. It was accompanied by a slight hæmorrhage. She did not consider herself to be experiencing true labour pains, but said the sensations were somewhat similar. At 8 o'clock the same evening she went to bed and shortly afterwards passed a partly macerated fœtus. It measured 7½ inches, and the skin was yellow, shrivelled, and waxy-looking. The placenta had not come away, and a small shrivelled cord was hanging from the vagina. The abdomen was next examined, and by palpation the uterus was found to be on a level with the umbilicus. On auscultation a fœtal heart was heard, thus proving the presence of another child. On vaginal examination little or nothing abnormal could be made out.

The patient attended at the infirmary next day, bringing the macerated fœtus with her. She had had no pain since the day before. Professor Hellier forthwith made a vaginal examination, and informed her that the head of the second fœtus was presenting. She was advised to stay in the infirmary until the labour was over, but declined as she could not leave her other children, and went home in a cab. She was attended the same afternoon by the maternity clerk, who delivered her naturally of a living, premature female child at 3.25; length about 15 in., weight not ascertained. The child was cyanosed and was very feeble. The placenta followed in 20 minutes. There was no post-partum hæmorrhage. The placenta was normal and had two separate cords. The one to which the living fœtus was attached was of normal size and consistence. The other was shrivelled and atrophic. To this cord the dead fœtus had been attached.

The second child survived for only one week. It was born the first not expected to live very long, and never recovered

ı its cyanosed condition. The mother developed a slight gestion of the lungs, probably due to pneumonia, but ɜr treatment this disappeared, and when last seen, on ust 8th, she was quite well.

ıe interesting point in this case is that it demonstrates , in a twin pregnancy, one fœtus may die, whilst the r continues to develop normally; also that the uterus carry the dead fœtus to a much later period of the nancy. In this case the onset of labour was determined he accident. Nineteen hours separated the birth of the g from that of the dead fœtus.

CASE OF CONGENITAL ANGIOMA OF THE TONGUE.

FRANK M. HUGHES, M.R.C.S., L.R.C.P. LOND.,
ASSISTANT SURGEON, GRAVESEND HOSPITAL.

IE following case is of interest in that, I believe, it is ımmon, and because of the apparent local inconvenience growth has caused resulting in a chronic dyspeptic lition.

ıe patient is 26 years of age. At birth a small swelling he dorsum of the tongue of about the size of a pea was ɔed and diagnosed by the medical man in attendance as birthmark." No pain has ever been caused by it, and e has been no ulceration or hæmorrhage from the growth. he age of 16 years the tumour had become as large as ırble, causing difficulty with mastication and consequent gestion. A chronic condition of indigestion from that necessitated the patient giving up training for his pro- on. He was advised to undergo a course of careful ng and attention to his bowels. This treatment had llent results as long as it was carefully carried out; but ect of feeding at regular times, with careful attention to ood, brought a return of the trouble.

ree weeks after joining the Army the patient was sent a hospital with symptoms suggesting appendicitis, but recovered with careful feeding. Indigestion has become gradually worse, with constant attacks of constipation. He is unable to digest ordinary food owing to difficulty of mastication. There is no history or evidence of syphilis.

The present condition of the growth is as follows:—A reddish-blue growth, the size of a large marble, situated on the dorsum of the tongue, well defined with raised edges, and smooth to the touch. On pressure the growth can be reduced in size, but immediately fills up again when the pressure is removed. Tongue is always furred and unhealthy, the portion around the growth feels indurated. Small "shotty" glands can be felt at the angle of the jaw on both sides. The patient has a sallow, unhealthy appearand has lost weight considerably during the last year.

ıas been thought inadvisable to remove the growth, as , cavernous type of angioma and would possibly be very ılt to remove without seriously impeding the use of the e owing to the fact that a large portion of the organ l have to be removed; and bearing in mind that it is a n growth and that with care and attention to diet very discomfort may be caused, the general opinion has been t is better to treat the patient from a medical rather surgical point of view.

TIONAL HEALTH SOCIETY.—The Lady Priestley ɔrial Lecture on The Child and the Home will be given r Arthur Newsholme on Wednesday, Nov. 21st, at ., in the Robert Barnes Hall, 1, Wimpole-street, ɔn, W. 1.

Medical Societies.

MEDICAL SOCIETY OF LONDON.

The Value and Limitations of Sanatorium Treatment.

A MEETING of this society was held on Nov. 12th, Sir STCLAIR THOMSON, the President, being in the chair, when the first stage was conducted of an interesting and valuable debate on the Value and Limitations of Sanatorium Treatment. The debate was introduced generally by Dr. T. D. LISTER, physician to the Mount Vernon Hospital for Consumption, and his address is published in full in THE LANCET this week. The subject was then taken up under the three headings of the Well-to-do (Dr. DAVID LAWSON), the Middle Classes (Dr. NOEL BARDSWELL), and the Working Classes (Dr. W. O. MEEK).

The Value and Limitations of Sanatorium Treatment for Tuberculosis as Regards the Well-to-do.

Dr. LAWSON said: Unlike his less-favoured brother, the well-to-do patient seeks medical advice on slender provocation, and in this way tuberculous disease is often accidentally detected in its early phase and the patient placed under sanatorium treatment while the chances of recovery are still good. Duration of treatment is one of the vital elements of success, and its possibility confers great relative advantage upon the well-to-do patient. His mind is freed from financial cares throughout his term of treatment. For these reasons it is not unfair to expect more favourable results from the sanatorium treatment of patients drawn from the better-off classes. The term "sanatorium treatment of phthisis" should be defined in a wide sense to include all the resources of modern medicine, as well as those of its sister professions. Skilled nursing is no longer the luxury of the rich, but a routine measure available to the humblest inmate of a pauper sanatorium. The pathologist, radiologist, laryngologist, dermatologist, neurologist, and general surgeon are all pressed into the service of the sanatorium physician. Sanatorium treatment as now understood and administered secures for the patient under specially climatic surroundings and under conditions specially favourable for detailed supervision all the resources of modern medicine. Dr. Lawson then submitted the results of his own experience in 1000 sanatorium cases, dealing with their condition as they were on the point of leaving the sanatorium.

The classification adopted was based upon the consideration (see Table I.) that a patient on completion of his treatment in the sanatorium might be definitely worse than

TABLE I.—*Analysis of 1000 Cases of Pulmonary Tuberculosis Treated under Sanatorium Conditions.*

Depreciated		Improving	Appreciated	
204 = 20·4 p.c.		265 = 26·5 p.c.	531 = 53·1 p.c.	
Worse	Died	Arrest	Complete recovery	
141 = 14·1 p.c.	63 = 6·3 p.c.	170 = 17 p.c.	361 = 36·1 p.c.	

when he began treatment, in which case he was placed under the category of those whose state had *depreciated*. If his condition had so much improved that full working capacity had been restored his name appeared under those whose condition had *appreciated*. Between those two classes existed a large number of patients whose condition was undoubtedly improving, but the permanent trend of whose disease could not yet be definitely predicted when lost touch with. When evidence of acute disease tending to subside was still present they were included under the heading of *improving*. A certain number whose condition showed no definite alteration for better or worse were included under the heading of those whose condition was believed to be worse. Under *complete recovery* were included patients whose expectoration had disappeared or, if present, contained no tubercle bacilli, and in whose chests evidence of moisture could no longer be detected, who no longer presented constitutional evidence of tuberculous disease, and whose general health was excellent. Compensatory emphysema was well marked in these cases. By *arrest* was meant a similar condition with two points of difference: (1) The arrested case might still have a little expectoration from time to time, usually in the morning, containing tubercle bacilli; and (2) a little moisture in the lung might still be recognisable. In some of

these patients fine râles at the extreme apex or sternal free border remain throughout life a permanent legacy of the disease. Of the 531 cases which became perfectly well there were 54·2 per cent. in which no tubercle bacilli were found, as against 45·8 per cent. in which they were recognised (see Table II.). It might be asked: (1) What was the bearing

TABLE II.—*Analysis of the Cases whose Condition Appreciated under Treatment in Relation to the Number of Lobes involved.*

Appreciated 531 cases		
1 lobed	2 lobed	3 lobes or more
301	189	41
56·6 p.c.	35·6 p.c.	7·8 p.c.
Closed Cases—288	=	54·2 p.c.
Open Cases—243	=	45·8 p.c.

of a parental history of pulmonary tuberculosis on the results of treatment? In 112 instances one parent had suffered from pulmonary tuberculosis, in 10 instances both parents. Of cases with a negative family history 21 per cent. had depreciated and 51·2 appreciated, compared with 15·2 per cent. and 66 per cent. respectively for cases with a positive history. The result of treatment, therefore, had proved more favourable in the case of patients carrying a hereditary burden. (2) To what extent might the patient's own clinical history of certain maladies tend to limit or affect the result of treatment? (*a*) Syphilis. In 8 instances a history of specific disease was admitted. Of these the condition on discharge of 1 was worse, 2 died, and the remaining 5 did well, 1 securing arrest of the disease and 4 making complete recovery. (*b*) Malaria. Malaria occurred in 33 cases (see Table III.), of whom 8 depreciated, 9 occupied an intermediate

TABLE III.—*Malaria.* 33 cases.

Depreciated 8 = 24·2 p.c.	Improving 9 = 27·2 p.c.	Appreciated 16 = 48·5 p.c.	
Worse 7 = 21·3 p.c.	Died 1 = 2·9 p.c.	Arrest 7 = 21·3 p.c.	Complete recovery 9 = 27·2 p.c.

position and improved, and of the remaining 16, all of whom did well, 9 made complete recoveries and in 7 the disease became arrested. (*c*) Appendectomy (see Table IV.). Fifty-seven patients, or over 5 per cent. of the total had their

10 died in the sanatorium. Twelve showed signs of improvement and the remaining 13 did distinctly well, in 7 cases the disease becoming arrested and in the remaining 6 complete recovery taking place (see Table V.). Of senile phthisis of 57 cases—i.e., those in which the disease appeared at 50 years of age or over (8 women and 49 men)—39 per cent. did badly under sanatorium treatment (see Table VI.). Pulmonary tuberculosis occurring in later life was both more common and more serious than many had thought. After dealing at length with the subjects of dieting and exercise in sanatorium treatment Dr. Lawson concluded by emphasising the value of artificial pneumothorax as a means of stopping dangerous hæmorrhage and in bringing about arrest in localised acute disease.

The Value and Limitations of Sanatorium Treatment for the Middle Classes.

Dr. BARDSWELL said: In virtue of the post I held at Midhurst for over 11 years I am in a position to approach the question of the value of sanatorium treatment for the middle classes with some confidence. From the first, the after-history records of all patients discharged from the sanatorium have been most carefully kept, so that the value of the work of the institution, as judged by statistics, can be determined without much difficulty. The sanatorium admits exclusively patients belonging to the more educated classes whose means are limited—clerks, school teachers, shop assistants, commercial travellers, civil servants, and members of the various professions; domestic servants and the working classes not being eligible. The average length of treatment in the sanatorium is from four to five months. The statistics I furnish, therefore, represent what some four months' treatment in a sanatorium can effect for consumptive patients belonging to the social classes indicated.

It is known to most of us that our medical statistics do not commend themselves to statisticians and actuaries; they hold that the methods we adopt are crude and inaccurate. With respect to mortality statistics after sanatorium treatment, they are agreed that the only reliable method is to compare the number of deaths that have occurred over a term of years following discharge, among patients of various ages, with the number of deaths which would have occurred had these same patients been members of the general population. The mortality rate of the general population at all ages has been determined and furnishes the means of comparison. By applying it we learn how far any individual consumptive or group of consumptives have failed to realise the life which is expected by the general population of the same age. Mortality rate can then be expressed in terms of the relation of the number of deaths which occurred, termed the "actual deaths," to the standard number of deaths, termed the "expected deaths." The mortality experience of any number of institutions may be compared with this same standard, and the results obtained compared one with the other without fear of fallacy. Thanks to the courtesy of Mr. F. B. Wyatt, F.I.A., I am able to show you some of the Midhurst results worked out on these lines. I gave Mr. Wyatt the after-history returns of 384 patients observed over a period of six years since their discharge. This number was made up of 101 cases classed in Group I. and 283 cases in Group II. All the cases had tubercle bacilli in the sputum when admitted to the sanatorium. I excluded contemporary cases in which the bacilli were not demonstrated, so that there should be no doubt that the cases dealt with were suffering from pulmonary tuberculosis.

Experience of 384 Cases Observed over Six Years.

Turban-Gerhardt group.	Actual deaths.	Expected deaths.	Ratio.
Group I. (101 cases)	17	2·510	6·8
Group II. (283 cases)	118	5·640	20·9
Total (384 cases)	135	8·250	16·4

This record shows that during a period of six years following discharge from the sanatorium the number of deaths that occurred among the Group I. cases was over six times, and among the Group II. cases over 20 times that of the expected deaths. Taking the experience of all the 384 cases, the actual deaths during the period of observation were more than 16 times as many as the expected number. When observations are extended over a longer period of years the disparity between actual and expected deaths becomes less marked. This is what one would expect. During the first few years after discharge the worst cases succumb and the death-rate is heavy; subsequently, with the survival of the more favourable, the comparative mortality is lessened. It

ay be contended that the number of cases now dealt with too small to allow of conclusions being drawn from ıe figures. This is true; at the same time I should say ıat a complete review of the Midhurst results now in ·ogress is giving confirmatory results. A similar study of e after-histories of 1449 cases treated at the Adirondack ınatorium, U.S.A., published by Lawrason Brown and ›pe, shows that the Adirondack experience has been almost entical with that at Midhurst.

Although few of us, probably, are accustomed to consider ›rtality from any disease in terms of actual and expected aths, or have a mental standard by which to judge the ınificance of statistics presented in this fashion, yet the ›rtality experience I now show you is evidence of the ıs of life which occurs among the more favourable ses despite the benefit conferred by treatment in a ıatorium. Unfortunately, there are no means of deter-ning the mortality experienced by comparable cases treated on other lines. Personally I feel sure it would be a heavier e. Reviewing carefully the after-history records year year of the Midhurst patients, I am impressed by the ›reme importance of after-care, using the term in its widest ıse. Among those who have done well, a large proportion ve been enabled to continue their treatment for some ınths after leaving the sanatorium. Change of occupation ı not been a large factor except among young men not yet nmitted to any calling, and it is this class which furnishes ny instances of successful emigration. The nature of the ployment followed has a great bearing upon prognosis. ·gy of all denominations and members of our own pro-sion show the highest proportion of permanent recoveries, largely to the fact that both can exchange unfavourable favourable conditions of work without any material loss income. Many clerks have safeguarded their future by oming commercial travellers or finding employment in ntry towns; a great many school teachers, shop stants, and civil servants also, have removed from an to rural areas with encouraging results. Among many who were unable to make any such change, ıortening of the hours of work or a long week-end for e months after discharge has proved of much value. ile treatment in a sanatorium is all-important for the eful case as a means of education and obtaining a good t on the road to recovery, the critical time begins when sanatorium is left. Success or failure is determined ng the next two or three years. It is the patient himself the general practitioner who then shoulder the responsi-y. Happily, the after-history records at Midhurst are ear evidence that it is not lost, for they represent a ifying measure of permanent success. It need scarcely ıdded that, in my judgment, sanatorium treatment for middle classes is of great value. Admittedly, my ion is a biassed one, but I have discussed this question Sir Hermann Weber, Sir Clifford Allbutt, and Sir)ouglas Powell, to mention a few only who are best ified to express an opinion, and their reply is unanimous nfirmation.

. BARDSWELL added: I accept Dr. Lister's invitation ake a few comments on his address. I agree with him the good that a patient derives in a sanatorium depends nously upon the capacity and character of its medical ·intendent. I have purposely not quoted any figures of ıdiate results; they give little information and express sonal opinion, but to be able to state whether a patient ve or dead some six or ten years after discharge is to ss data of real value. It is such records that we want of. The lack of control figures for consumptives treated wise than in sanatoriums I deplore. With regard ecial treatments and aids, Dr. Lister's experience and ›n are my own. I suppose I have tried every remedy ht forward seriously; individual cases have done ıntly on most of them when given as an addition to ıent in a sanatorium. If I had to choose two remedies those I have made use of, including all so-called ic therapies, I would ask for the old Brompton mixture, sodæ and gent., with a dash of nux vomica and the liquid t of cascara. Dr. Lister asks: Do we all know how we in respect of tuberculin and the treatment of mixed ions with vaccines? I know my own position so far as ·ium practice is concerned, but I cannot speak for ısary and city conditions generally. The after-history ; at Midhurst for the three consecutive years, during which tuberculin was employed largely, are no better than those for any three years during which tuberculin was not used at all; nowadays perhaps it is necessary to add that they are no worse. The same can be said for vaccine treatment.

The Value and Limitations of Sanatorium Treatment as Regards the Working Classes.

Dr. MEEK said that during the three years 1905–6–7, 292 patients, in whose sputa tubercle bacilli had been found, were discharged from the sanatorium at Frimley. Of 266 of these, who were traced to the end of the first year following that of their discharge, 65·8 per cent. were well and working, 24·4 per cent. were alive, and 9·8 per cent. were dead. Of 245 traced to the end of the second year following that of discharge, 56·8 per cent. were well and working, 21·6 per cent. were alive, and 21·6 per cent. were dead. Of 209 similarly traced to the end of the fifth year following that of discharge, 38·8 per cent. were well and at work, 14·8 per cent. were alive, and 46·6 per cent. were dead. These 292 were selected cases, carefully chosen by the physicians to the Brompton Hospital, and the great majority had undergone preliminary treatment at that institution, thus being under consecutive treatment for a very considerable period. The chief factors responsible for this rapid loss of working capacity in a high proportion of cases were, in the main, well recognised, and in certain directions lay opportunities for improvement—e.g.: (1) the return to faulty environment; (2) the lack of provision for prolonged treatment; (3) and for re-treatment; (4) the admission of cases unsuitable on grounds other than medical; (5) the need for earlier diagnosis.

To demonstrate the beneficial result of change of environment Dr. Meek showed tables contrasting the immediate after-histories of two groups of cases.

(A) During 1915 a group of 32 cases, presenting important features in common, left the sanatorium. They all came from urban working conditions. In all tubercle bacilli were present in the sputum at the commencement of treatment; in none were they so found at its conclusion. The average number of lobes of the lungs in which any signs of disease had been noted was 1·8. They formed an excellent collective example of the "good sanatorium case," and were classified on discharge as instances of "apparent arrest" of the disease. They all returned to the homes and working conditions in which they had broken down previously. The majority of the patients were of distinctly the better working-class type. Their homes generally were clean and not obviously insanitary, sleeping arrangements satisfactory, and wages good. The work to which they returned was of very varied character, but as a whole, neither particularly arduous nor dangerous. All those still alive had been traced up to the latter half of the present year (1917). Of these 32 people, at the time of the latest reports (averaging two years and a few months from the date of discharge) 10 (31·2 per cent.) were well and at work and had kept so; 5 (15·7 per cent.) were "fairly well" and still at work; 8 (25 per cent.) were alive, but unable to work; 9 (28·1 per cent.) had died.

(B) In the same year, 1915, out of a number of cases of relatively good prognosis who were recommended to secure improved conditions 44 were able to effect a change for the better. They were not specially selected as having only slight pulmonary lesions, for in a considerable number such lesions were quite extensive. Nevertheless, they all appeared capable of doing a reasonably full day's work and to have a fair chance of maintaining working capacity in healthy surroundings. In all tubercle bacilli were present in the sputum at the commencement of treatment, in 23 they were still present on discharge, in 21 they were not so found. The average number of lobes of the lungs in which any abnormality had been noted was 2·2. All have been traced into the latter half of the present year. They form a group roughly comparable to the one analysed above. Twenty-nine effected a change of both residence and occupation, five a change of occupation only, while ten found situations at their former employment in more suitable localities. Many made the change unaided except with advice, to others help was given in the search for work or in the removal of the home, for some situations were found, and for a few courses of instruction in motor-driving, &c., were provided. Six joined the Forces. In most instances the work and surroundings which they were able to secure were far from ideal, but constituted a marked improvement on their former conditions. Of these 44 individuals, after a lapse of time averaging a few months over two years and excluding one who was accidentally killed, 35 (81·4 per cent.) have remained continuously well and at work; 6 (13·9 per cent.) are well and at work, but have had time off from work for illness and in 4 cases further institutional treatment; 1 (2·3 per cent.) is fairly well, but not at work; 1 (2·3 per cent.) has died.

The lists, although far from being accurate statistical tables, illustrated fairly the rapid wastage on return to urban industrial life and the improved outlook under better conditions. It seemed possible that the attempt to return to working-class life in cities of large numbers of discharged sanatorium patients who were, or had been recently, cases of "open" disease might have to be abandoned as entailing great waste of life, labour, and money.[1]

[1] We hope to publish Dr. Meek's paper in full in our next issue.

Mr. H. MORRISTON DAVIES stated that the great barrier to successful medical treatment in all but the earlier stages of pulmonary tuberculosis were the mechanical disabilities. These disabilities appeared almost from the commencement. In chronic cases they gave rise to symptoms more serious even than the primary disease. They were due, on the one hand, to the fibrous tissue formation in the lung and in the pleural membranes and, on the other hand, to the anatomical and physiological conditions of the lung, of the pleural cavity, and of the surrounding walls. At first contraction of the lung due to the fibrosis could be to a great extent equalised by the falling in of the chest wall, by the displacement of the mediastinum and diaphragm, and by emphysema of the healthy parts of the lungs. An early case was, in fact, one in which the mechanical disabilities were easily compensated for in this manner. Striking improvements and even arrest of the disease could be expected, therefore, by medical treatment. Once this stage was past, and with the increase of the fibrosis, of the bronchial dilatation and secondary infection, and the development possibly of cavities, a temporary improvement only could be hoped for unless the mechanical disabilities were compensated by surgical intervention. The four methods available were: 1. Nitrogen displacement, with stretching, division, and even rupture of adhesions when necessary. 2. Partial replacement of the lung and parietal pleura by foreign substances when the disease was localised and nitrogen displacement was impracticable owing to pleural adhesions. 3. Rib mobilisation, by which operation the lung, together with the chest wall, were collapsed. This operation was a more serious one than nitrogen displacement, and was therefore done only when the latter was impossible. The type of case must be much more rigidly selected, and the results obtained were extremely gratifying. All these methods produced a general or local collapse of the lung; they allowed the fibrous tissue to contract without causing distortion of the intra- and extra-pulmonary structures. Interstitial and bronchial cavities were obliterated and the serious effects of secondary infections were abolished. The lung was at rest and the symptoms subsided. The patient was thus placed in a condition in which medical and hygienic treatment could be employed with most beneficial results. 4. Paralysis of the diaphragm by section of the phrenic nerve in the neck. The affected half of the muscle was relaxed and rose into the thorax. The symptoms due to distortion of the diaphragm owing to basal adhesions or to the drag on the muscle during nitrogen displacement were abolished. There was a reduction in the size of the lower part of the pleural cavity and a partial collapse of the base of the lungs. This was of great benefit in cases of tuberculosis or of dilatation, whether primary or secondary, of the bronchial tubes of the lower lobe. Surgical intervention must not be regarded as a method of treatment which could be carried out independently of the medical. The best results were obtained by the closest combination of the two.

The debate will be continued on Nov. 19th, when Sir R. Douglas Powell, Sir Arthur Newsholme, Dr. F. R. Walters, Dr. A. Niven Robertson, Dr. G. A. Crace-Calvert, and Dr. J. J. Perkins are expected to take part.

WEST LONDON MEDICO-CHIRURGICAL SOCIETY.—A meeting of this society was held at the West London Hospital on Nov. 2nd, Dr. A. J. Rice-Oxley being in the chair. Major W. McAdam Eccles demonstrated by means of photographs and microscopic slides an unusual case of Hermaphroditism, described as of neutral sex. The external sexual characteristics were those of a female, but testes in a low state of development were present and the uterus was absent. Dr. T. Grainger Stewart and Dr. Reginald Morton showed a case of Œsophageal Diverticulum, in which the foul breath and eructations of decomposed food frequently associated with the condition were absent. Dr. Morton, among other cases, showed a skiagram of a stomach distended by a hairball, in which the diagnosis was made by means of X rays and afterwards confirmed at operation. Mr. Aslett Baldwin showed a man who had had calculi removed from both kidneys and the left ureter, and who now had hernial protrusions from all three operation wounds. He had recently undergone operation for radical cure of a left inguinal hernia. Dr. E. A. Saunders, Dr. H. S. Souttar, Dr. S. A. Owen, Dr. G. Pernet, and Dr. Guesada exhibited other cases, or skiagrams of cases, the latter in conjunction with Dr. Morton. After an interesting discussion the meeting terminated.

ROYAL SOCIETY OF MEDICINE

SECTION OF ELECTRO-THERAPEUTICS

Necessity for Education in Radiology and Electro-therapeutics.—The Coolidge Tube.

AT the opening meeting of this section, held at the Royal Society of Medicine on Oct. 19th, Dr. G. HARRISON ORTON, the President, gave an address on the Necessity for Education in Radiology and Electro-therapeutics. He pointed out the unsatisfactory status, in this country, of radiology and electro-therapeutics and of those who specialise in these subjects. The present condition of affairs was unfair to the patient, who was often the chief sufferer, and unfair to the radiologist and electro-therapeutist. It was due to defective education, and therefore before any improvement could be expected to take place some scheme of education must be devised. The July number of the *American Journal of Roentgenology* contained a statement on the action of the U.S.A. military authorities in the organisation of X ray work for Army purposes which was in striking contrast to the methods adopted in this country. Schools for the teaching of military radiographic work had been established in charge of experts in different parts of the country, under the direct control of the Surgeon-General. Medical officers intending to do X ray work attended for three months' instruction, and were then accepted or declined according to the ability shown. Arrangements were made for the X ray examination of recruits, especially from the point of view of the condition of the chest. The numerous methods for the localisation of foreign bodies were considered, and three methods were selected to be taught thoroughly. The U.S.A. Government was defraying the expense of this organisation and teaching, and officers drew during the course of instruction the pay of their respective ranks. In this country, Dr. Orton said, practically the whole of the organisation of military X ray work had been carried out without any consultation with prominent radiologists. The authorities evidently failed to recognise either radiology as an important branch of medical science or the radiologist as a specialist. And the same thing applied with perhaps even more force to electro-therapeutics. In view of this serious situation a committee of the Section of Electro-Therapeutics was appointed in March last and a scheme had been elaborated to provide for: (*a*) A central organisation in London, housed in an institute, where teaching facilities would be available in the scientific part of the curriculum, the practical experience being available in the large hospitals. Later, if necessary, centres could be started in other towns. (*b*) A post-graduate diploma in Cambridge where a research hospital would be built. This hospital would be devoted to the scientific investigation of the many physiological, pathological, and physical problems that are waiting to be worked out. It would also be available for those who wished to work on various problems, and especially for those who were investigating with a view to the M.D. thesis. Dr. Orton concluded that as a result of what had been already done no doubt existed that the Cambridge part of the scheme could soon be in active being if the necessary financial support could be arranged. It remained to see that the London scheme was put upon a sound basis so that the two might be able to coöperate in practical teaching and research work, and provide those who desired to study these subjects with conditions of so doing comparable with the facilities available in other countries.

Dr. F. HERNAMAN-JOHNSON described a modification in the use of the Coolidge Tube of interest to those radiologists who work with a coil outfit on continuous current mains arranged on the usual "three-wire" system. Hitherto accumulators have had to be used for the heating circuit, owing to the fact that this circuit was always, with the usual connexions, charged at a high potential. Shorter and Barnard have recently shown that a tube will work perfectly well if the negative pole of the coil be grounded, and this led Dr. Hernaman-Johnson to experiment with direct heating of the filament through suitable resistances. He places these on the "neutral" side of the house supply, and connects the negative pole of his coil to them, so that earthing of the high-tension circuit takes place at the power station through the neutral wire. A steady heating current is thus obtained and the outside can be handled without any risk of shock. Dr. Hernaman-Johnson pointed out that if in future the filament of the

e can be made suitable for 200-250 volts, a very simple istance will suffice, and there will be no waste of current. also showed that all the controls and meters both for l and tube may be assembled on one trolley switchboard se to the operator's hand. These new arrangements uld greatly facilitate the use of the Coolidge tube. The erimental stage may be said to have been passed, as the tem has been in use for two months at the Cambridge spital, Aldershot, and over 200 treatments have been inistered with the Coolidge tube heated in the manner cribed.

SECTION OF LARYNGOLOGY.

Exhibition of Cases and Specimens.

MEETING of this section was held on Nov. 2nd.

r. A. BROWN KELLY, the President, having delivered a f introductory address from the chair,

ir STCLAIR THOMSON showed a girl, aged 15, who ered from a Fusiform Dilatation of the Œsophagus arently Idiopathic. He demonstrated that the interior he cavity was lined by plaques of white material which sisted largely of oïdium albicans and other bacteria. age with various antiseptics, including eusol, had failed et rid of the infection. Œsophageal bougies passed into stomach with the greatest ease.—Dr. WILLIAM HILL gested that treatment by ionisation might be successful. PRESIDENT advised dilatation of the lower end of the phagus.

r. IRWIN MOORE showed a boy, aged 8, with Lupoid erculosis of the Soft Palate, and who was also the ect of congenital syphilis. The soft palate and uvula were l, rigid, and leathery; there was œdematous infiltration he posterior pillars of the fauces, the epiglottis, and enoids. Adenoids had been removed and shown to be ially tuberculous under the microscope. A cervical d also showed caseous areas and giant-cell systems. sermann reaction was strongly positive. The blood t showed no characteristic changes.—Professor S. G. TOCK said that he had examined sections of the uvula r the microscope. In his opinion the lesion was tuber- is, although the picture was not characteristic and tubercle bacilli had been found. He considered the ition comparable to lupus erythematosus of the face.

. P. WATSON-WILLIAMS exhibited a number of draw- of the naso-pharynx as seen through the endorhinoscope. was in the habit of using Dr. Holmes's modification of ptin's instrument and employed it in preference to the oscopic mirror. The instrument was of real value in ling one to obtain a good view of the Eustachian tubes fossa of Rosenmüller and in tracing the source of pus in the naso-pharynx.

jor H. D. GILLIES and Mr. G. S. HETT showed patients were under treatment at Sidcup for war injuries to the and face. Stages in the formation of a new nose were n. Rib cartilage had been grafted under the skin of orehead and was then brought down to form the bridge e new nose. Great interest was aroused by these cases, iscussion was postponed.

ier cases and specimens were shown by—

DAN MCKENZIE: Epithelioma of the Ethmoidal finth; removal by lateral rhinotomy.

NORMAN PATTERSON: 1. Excision of the Upper Jaw for noma of Antrum and Palate, followed by Diathermy. cision of the Retro-pharyngeal Gland for Recurring pharyngeal Abscess of Tubercular Origin.

W. H. KELSON: 1. A Tonsil Forceps. 2. Paralysis of eft Vocal Cord in a man aged 39.

IRWIN MOORE: 1. Tertiary Syphilis of the Pharynx in a e aged 44, clinically resembling tuberculosis of a lupoid 2. Complete Paresis of the Left Vocal Cord, due to a stinal growth.

J. L. AYMARD: 1. New instruments. 2. Septum ens. 3. Rhinoplastic cases.

F. A. ROSE: Sarcoma of the Antrum.

WILLIAM MILLIGAN: 1. A Piece of Mutton Bone removed he entrance to the œsophagus. 2. Photographs showing al, with the aid of the fluorescent screen, of a pin n the second division of the left bronchus (pin shown). ro-papilloma of Trachea; removal by external opera- recovery. 4. Fracture of Four Rings of the Trachea; dyspnœa, operation, recovery.

WALTER HOWARTH: Case of Complete Laryngectomy.

Reviews and Notices of Books.

1. *Studies in Malaria.* By HUGH STOTT, M.B., B.S. Lond., Captain, I.M.S. Calcutta and Simla: Thacker, Spink, and Co. 1916. Pp. 190. Price 10*s.* 6*d.* net.
2. *A Plea and Plan for the Eradication of Malaria throughout the Western Hemisphere.* By FREDERICK L. HOFFMAN, LL.D., Statistician to the Prudential Insurance Company of America. Being an address read in abstract before the Southern Medical Association in Atlanta, Georgia, on Nov. 14th, 1916.

1. THIS book is of real interest and gains from the unconventional way in which the subject is approached. One of the most valuable sets of observations recorded is that of a prophylactic quinine experiment. The prophylactic dose was 15 grains thrice weekly for five months (none for two months when the regiment was in the hills) and 10 grains thrice weekly for nearly six months.

October, 1911, to September, 1912.	Total strength.	Total fever admissions.	Rate per 1000 strength.	Primary admissions.	Rate per 1000 strength.
Cos. A, C, E, G. (taking quinine)	3931	259	65·8	170	43·2
Cos. B, D, F, H. (not taking quinine)	3900	265	67·8	179	45·8

The facts to be found in the literature with regard to quinine prophylaxis are most unsatisfactory. The question could have been settled years ago by a system of "half with" and "half without" quinine, but unfortunately even at the present day the matter is one of dispute. The author's figures with regard to a curative course of quinine are not easy to follow, but apparently by 10 gr. four times a week for four months about 44 per cent. were "cured," the observation period being eight months. It would appear, however, that 75 per cent. of readmissions took place while the patients were actually undergoing the curative course. This seems peculiar and raises the suspicion that the quinine really was not taken. The author's observations on the *total* mononuclear count in malaria are of considerable interest; the percentage of total mononuclears at various temperatures from 105° F. to normal varied from 11 to 81 per cent. To be able to make a diagnosis in the absence of parasites—e.g., in the interval between treatment and relapse in simple tertian malaria—is of the greatest importance, but the value of the mononuclear count requires re-investigation, more especially as to the possible variations in health and disease other than malaria. Nor do we know how long the increase continues after a definite cure.

A defect of the book is the almost complete absence of information about parasites. Malaria, while dealt with from other than the clinical standpoint, is classified too much from that standpoint—e.g., remittent or intermittent character of the fever—whereas a knowledge of parasitic findings would have been of prime importance.

2. We gather from Dr. Hoffman's pamphlet that, by a resolution adopted at the Second Pan-American Scientific Congress held in Washington in 1916, the United States and all Pan-American countries agreed, singly and collectively, to join in an effort to eradicate malarial diseases from the Western Hemisphere. As a result of this resolution, a "National Committee (of the United States) on Malaria Eradication" was formed, of which Dr. Hoffman is a member, and he appears to have written the present treatise with the view of assisting the committee in the object they have in view. The thesis is divided into three parts: Part I., "A Plea for Organised Action"; Part II., "A Plea for Organised Prevention and Control"; and Part III., "Some Essential Statistical Considerations."

The first part contains a résumé of what has been accomplished in diminishing the prevalence of malaria in different parts of the world. Stress is laid on the fact that, despite the great wealth of the country and the extensive prevalence of the disease in certain of the Southern States, no comprehensive scientific research in connexion with malaria has as yet been undertaken in America. Apparently

the governing bodies do not fully realise the importance of the problem. In the author's opinion, action by the Government is essential to the success of any scheme for the eradication of the disease. He states that in recent years some valuable local surveys have been made by the United States Public Health Service, and many scientific papers and reports have been contributed on important technical aspects of the distribution, prevention, and control of malaria, but the effect of such work has been negatived in large measure by want of the necessary coördination of municipal, State, and Federal effort. A brief description is given of the methods employed, with such excellent results, for the eradication of malaria in the Panama Canal Zone—a model which might, with necessary modifications, be adopted in other parts of America.

Part II. deals with, and enlarges upon, the general aims and objects of the National Committee, as agreed upon at a meeting held in Washington on May 16th, 1916. The functions of this committee may be briefly summarised as follows: (*a*) To stimulate the scientific and public interest in malaria problems; (*b*) to serve as a medium through which societies and individuals may become identified with the study and prevention of malarial diseases; (*c*) to coördinate the efforts of these agencies with those of constituted Federal, State, and local authorities. It is clearly recognised that the success of any scheme depends upon adequate financial support from the Federal Government, and it is hoped that a Bill may be introduced into Congress to legalise the necessary expenditure. In addition to Federal, State, and local government coöperation, it is regarded as essential that the more important international, national, and corporate health-promoting agencies should also lend their aid in the furtherance of the practical as well as the theoretical work of the National Committee. Among other suggestions for the prosecution of the campaign the following may be enumerated. It is proposed, for example, that malaria and mosquito surveys should be made, and that the public should be educated in the importance of preventive measures. The provision of facilities for the free microscopical examination of the blood is advocated to assist in the diagnosis of the disease. The establishment of State drainage commissions and drainage districts is necessary in order to get rid of flooded areas and swamps which are a menace to health. The establishment of hospitals for the treatment of patients is regarded as a matter of importance. It is also suggested that consideration should be given to the question of how far use might be made of the natural enemies of the mosquito as a means of diminishing the prevalence of that parasite; for example, it should be ascertained whether certain fishes have been found useful for this purpose in the West Indies and Hawaii.

In Part III., with reference to certain statistical considerations, it is pointed out that the extent of morbidity cannot be accurately ascertained from mortality returns in view of the fact that the fatality rate in malaria varies considerably according to the form of the disease. Recent malaria mortality statistics for 34 American cities are given in Table IV. of the Appendix. According to this table the average rate of mortality from malaria was reduced from 8·9 per 100,000 for the 5 years ending with 1904 to 3·2 during the 5 years ending with 1914. There was, therefore, an actual reduction of 5·7 per 100,000 of population, equivalent to 64 per cent. Such figures give ground for hope that much may be accomplished by the present attempt to diminish the prevalence of malaria in the Western Hemisphere.

LIBRARY TABLE.

Rustic Sounds. By Sir FRANCIS DARWIN, F.R.S. London: John Murray. 1917. Pp. 231. Price 6*s.* net.—This book is a delightful collection of studies in literature and natural history, made up of reprinted essays and lectures and addresses delivered to such various bodies as the Eugenics Education Society, the British Association for the Advancement of Science, the Association of University Women Teachers, and the Society of Morris Dancers. It may be described as the artistic diversions of a man of science. Sir Francis Darwin is a devout lover of the beauties of nature, and was born and bred in an atmosphere of such love. In the papers entitled "The Movement of Plants" and "A Lane in the Cotswolds," as in the essay which lends a name to his volume, he gives us charming intimate glimpses of a very full knowledge of birds, trees, and plants; they are the result of studies by one who is artist and man of science combined. His experiments undertaken to prove that the "gravitation sense" of roots is to be found in the root-tip are detailed, and the interest which, it will be remembered, was evoked by these observations is renewed by re-reading them, as well as his well-known speculations on the memory of plants. Sir Francis Darwin does not agree with any theory of animal automatism. "The Pipe and Tabor" is a discourse on early rustic musical instruments, in which full justice is done to the work of that most retiring of antiquaries and medical students, the late Mr. Christopher Welch. Pipes have a fascination for Sir Francis Darwin as they had for Welch; he talks of them in "Rustic Sounds," where his personal knowledge of how to make a whistle out of a chestnut twig (elder twigs, by the way, are as often used) enables him to convict an erudite reviewer of "talking through his hat." Of course Sir Francis Darwin is an admirer of Jane Austen, and his essay on her and his tribute to her memory on her centenary is accurate and typical. He speculates on matters of heredity and eugenics, as typified by the Bennets, the Woodhouses, and the Elliots, and deplores, as other Austenites have done before, that this keen and kindly psychologist did not introduce her characters into succeeding novels, so that we could have been told what kind of children, for example, Elizabeth Darcy had. Included in the book are addresses on Francis Galton, Stephen Hales, "the father of physiology," and his brother, Sir George Darwin, the mathematician, the collection coming to an end with a delightful paper on "Dogs and Dog Lovers."

What Every Masseuse Should Know: Comfortable Grasps for Joint Movements. By VERA WADDINGTON. With Prefatory Notes by Sir RICKMAN J. GODLEE, Bart., K.C.V.O., and Mrs. ANNIE E. STEWART, and an Introduction by LAURA FAIRBAIRN. With 47 illustrations by the Author. London: Methuen and Co., Limited. 1917. Price 2*s.* 6*d.* net. Pp. 105.—Miss Vera Waddington, in a practical and admirably illustrated little book, supplies the masseuse (and presumably the masseur) with exactly what should be known by an operator who desires that the help she gives to a patient should be based upon a right understanding of principles. Massage is a combination of active and passive movements with manipulations designed to develop the action of the muscles and the mobility of the joints. Passive movements on the relaxed joints are usually performed to the extreme limit of the articulation and are carried out by the masseuse. Active movements, when free, are made by the patient under instruction of the masseuse, and when restricted are made during the introduction of resistance either by the patient or the masseuse. It is clear that throughout a course of massage the treatment can only be administered with full advantage if the operator understands what are the movements of joints, what are their capacities, and what are the muscular factors concerned here, or in breathing movements, or movements of the trunk and the head. Miss Waddington's book sets out in detail the foot, leg, hand, arm, and head movements that should be employed, and all the descriptions in the text for effecting the various abductions, adductions, flexions, extensions, and rotations are supported by the best drawings in illustration of such subjects that we have ever seen. She delineates in outline the positions to be taken up by patient and operator in the numerous movements, explaining the grasps to be employed and the manœuvres for obtaining mechanical advantage for their performance. The third part of the book deals adequately with breathing exercises. We endorse the words of Sir Rickman Godlee's prefatory note, that "it is almost safe to prophesy that her book will have the success which it undoubtedly deserves."

DONATIONS AND BEQUESTS.—By the will of the late Mrs. Rose Annie Leir, of Bristol, the testatrix left the residue of her estate, which will amount to between £4000 and £5000, as to one-fourth in trust for the Bristol Royal Infirmary, one-fourth in trust for the Bristol General Hospital, and one-fourth to the Bristol Asylum or School of Industry for the Blind at Bristol.—The late Mrs. Helen Simpson-Hinchliffe has bequeathed by will £500 to the Halifax Royal Infirmary.—By the will of the late Mr. S. G. Harrison, of Sheffield, the Sheffield Royal Infirmary and the Sheffield Royal Hospital and Dispensary will receive £1000 each, and the Children's Hospital and the Jessop Hospital £600 each. The University of Sheffield also benefits largely under the will.

BURNS
VARICOSE ULCERS
RHEUMATISM
NEURITIS

AMBRINE

(The only Authorised Preparation of Dr. Barthe de Sandfort. Various Imitations compel us to make this statement.)

GOUT
NEURALGIA
CHILBLAINS
SCIATICA

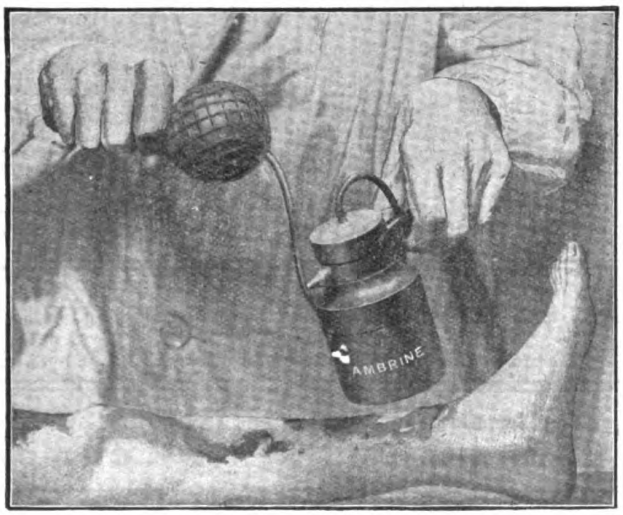
The most efficient means and method of ensuring active **Hyperthermal - Therapy** to the practical treatment of **Burns, Varicose Ulcers, Rheumatism, Gout, Arthritis, Neuralgia,** and similar affections.

Although the dressing with AMBRINE is occlusive and adhesive, it becomes after a short period non-adhesive, and can be removed without pain, hæmorrhage, or injury to the newly forming tissues. The healing takes place without leaving scars or contraction.

May be applied with a camel-hair brush, but our specially designed spray greatly facilitates the application of Ambrine, especially in the case of wounds or extensive surfaces.

The BRITISH MEDICAL JOURNAL, Sept. 2nd, 1916:—

Re AMBRINE TREATMENT.



"..... The primary and quite incontestable advantages of the treatment are two: it is agreeable to the patient, because entirely painless; it is convenient to the surgeon, because easily and quickly applied. ..... It is possible that the treatment would be useful in dealing with ordinary ulcers, and in any case it is certain that the study of its application to the raw surfaces is worth pursuing. ....."

26/10/17. E———

DEAR SIRS,—I thank you for the Ambrine. I found it very effective in a chronic and very painful varicose ulceration of leg.

Please send some more Ambrine, about 5s. worth.

A. G. W.,
M.R.C.S., L.R.C.P., &c.

THE LANCET, June 10th, 1916:—

THE VALUE OF AMBRINE IN THE TREATMENT OF WOUNDS.

"Attention is being drawn to the remarkable success of the Ambrine Wax treatment now being used at the Hôpital St. Nicolas at Issy-les-Moulineaux for burns, frozen feet, and all wounds where the tissues have been so damaged as to exact great length of time and considerable disfigurement in their restitution by the usual means. The Minister of War, in reply to the Deputy M. Mons as to why, in view of the marvellous results obtained by treating burns and frost-bites with Ambrine at the Hôpital St. Nicolas, all the soldiers suffering from such wounds were not sent there, stated that this was being done as far as possible. ....."

Recurrent Fever
SYPHILIS

GALYL

Frambœsia
Sleeping Sickness

3000 Injections (intravenous) were given in one of our **Service Hospitals.**

"No case has given the slightest cause for anxiety, and the clinical results are very satisfactory."

Staff Surgeon's Report.

GALYL is as effective as SALVARSAN or NEOSALVARSAN on Spirochætes and Trypanosomes, more rapid in action, and free from the neurotropic and congestive action of these preparations.

FOR INTRAVENOUS INJECTIONS:—

(1) **DILUTE.**—GALYL is supplied in neutral glass ampoules containing the necessary dose of Sodium Carbonate, sterile distilled water only being used for the dissolution.

(2) **CONCENTRATED.**—A special outfit containing one dose GALYL, one ampoule sterilised solution, and one small filter is supplied.

DOSES.
0·10—0·15—0·20—0·25—0·30
—0·35—0·40.

(3) FOR INTRAMUSCULAR INJECTIONS:—

GALYL is supplied in **GLUCOSE SOLUTION.**

DOSES.
0·10—0·15—0·20—0·30—0·40.

THE IMPROVED INTRAMUSCULAR INJECTION.

A STABLE SOLUTION *NOT* an Emulsion.

The GALYL is in the form of a Sodium Salt in a weak solution of Glucose. This is much easier to use and more rapidly absorbed than the oily emulsion. It is in every way identical with the intravenous—efficacy, dose, price, &c., only differing in administration.

Thorough and exhaustive tests in various parts of the Kingdom have proved it to be equal in every way with the intravenous; moreover, patients may resume and continue their occupations without inconvenience after injection of intramuscular Galyl.

RATIONAL TREATMENT OF CONSTIPATION

By the double action of secretions and peristalsis.

OPOLAXYL

Opolaxyl is a combination of the secretions of the liver (biliary), pancreas, and intestines with vegetable extracts of a non-drastic nature.

It combines all the secretions to correspond to nature's therapy and promotes a flow of bile and glycogen with their hematopoietic and antitoxic properties.

It is a normal regulator of the gastro-intestinal functions, consequently it improves the metabolic exchanges of the entire organism.

Opolaxyl does not lose its efficacy by prolonged use, its effect is gentle and constant, without the least irritation.

It is not merely a purgative, it stimulates the defective organs and revives the normal equilibrium, it has a lasting effect by reason of it rebuilding the organs, thus correcting diminutional function.

H——, Scotland, 8th Oct., 1917.

DEAR SIRS,—Having derived considerable benefit from the use of Opolaxyl tablets in my own personal case, I write as a practising physician to ask if you would make any reduction of price in the event of my sending you an order for a fair quantity, say, one dozen bottles.—Yours faithfully,

—— ——, M.D.

OPOLAXYL is put up in small size tabular form and should be swallowed without crunching, at bedtime or before breakfast. DOSE.—For obstinate constipation 2 or 3 tablets, afterwards 1 tablet every 3 or 4 days for a month.

LITERATURE and CLINICAL REPORTS on REQUEST.

The Scientific Treatment of INFLUENZA and allied ailments.

KINECTINE

According to Dr. MOUNEYRAT, the discoverer of Galyl and Hectine (the widely adopted Salvarsan Substitutes).

FORMULA:

Chlorhydrate of Quinine c. Hectine—i.e., *Benzo-sulfone-para-amino-phenyl-arsenate of Quinine.*

Non-toxic, produces no ill-results.

Easily taken (tablets) and well tolerated.

Highly satisfactory clinical results.

Not only a Prophylactic against, but a specific in

INFLUENZA, Catarrh, Coryza, NEURALGIA,

Malaria, &c.

H.M.S. ——, 27-7-17.

SIR,—I enclose P.O. for the tube of Kinectine. The drug has given every satisfaction.

W. B. H. W., Surgeon, R.N.

The Anglo-French Drug Co., Ltd., Holborn, London, E.C.

Medical Treatment of CANCER.

CUPRASE

Cuprase is a colloidal Copper hydroxide which is obtained chemically by the reduction of Salts of Copper in the presence of Albumosic Acid.

The numerous clinical reports from Doctors of repute in various countries give cases of a great variety. In all of these **pain has been eliminated,** and in a good percentage **cures are claimed,** and in no instance **any undesirable effects.**

Its *easy application* (subcutaneous injections) places it within the reach of all practitioners. It *is not toxic.*

Disappearance of the Pain.

Return of Sleep.

Increase of Appetite,

Colour and Strength.

WARWICKSHIRE, July 1st, 1917.

DEAR SIRS,—Will you please send me another box of Cuprase ampoules. The previous lot effected a most remarkable cure in an elderly lady suffering from cervical cancer—the cauliflower-like growth has disappeared with its offensive discharge.

This case was given three months' life by a Specialist, being inoperable.

Yours faithfully,

(Signed) B—— B——, M.R.C.S., L.R.C.P

THE LANCET.

LONDON: SATURDAY, NOVEMBER 17, 1917.

The New Voluntary Rationing Scheme.

THE scheme of voluntary rationing outlined by Sir ARTHUR YAPP this week should appeal to all classes of the community. When we are assured that a faithful adherence to the limited amounts of the staple foods set forth will save a grave situation, it becomes a national duty on the part of everyone to fall into line, while what strikes us at once is that no hard dietetic or physiological sacrifice is called for. Economy essentially is enjoined for the staples, but, of course, economy is desirable also as a patriotic effort in regard to all foods. The staple foods are bread, flour and other cereals, meat, butter, margarine and lard, and sugar. There is no rationing suggested outside this list, and it will occur to many in what directions the foods in the rationing scale may be supplemented or replaced. Potatoes, for example, are not included, and as a valuable source of carbohydrate supply they may be largely employed to eke out the stock of scheduled food-stuffs and so save the staples. In addition, an exchange can be made in certain cases, notably with regard to bread and meat. Thus, any person may take half a pound of meat over and above his meat ration in exchange for half a pound of bread to be deducted from his bread ration, and conversely any person may take half a pound extra of bread in exchange for meat. The scheme bears evidence of being well thought out from the economic point of view, while it provides a physiological sufficiency for all. The public would do well to bear this point in mind, for it is important to remember that a voluntary rationing scheme which provides amply for all physiological needs is much less a hardship than actual famine, while its adoption means the releasing of so much tonnage, and adding to the efficiency of transport services. In plain words, the individual who loyally enters into the spirit of the scheme is helping to win the war, *and is doing so in contradiction to no law of physiology or of medicine.*

It is easy to see that the Director of National Economy was guided in drawing up the scheme by the advice of recognised scientific authority. We find in it, for example, the substance of a number of recommendations contained in an article entitled "The Food of the Nation" by Dr. EDMUND SPRIGGS, which was published in THE LANCET of Feb. 10th, 1917. The valuable report on "The Food Supply of the United Kingdom," drawn up by a committee of the Royal Society last year, has, no doubt, also been of assistance. It will be remembered that this Committee included the professors of physiology in the Universities of London, Glasgow, and Dublin, and the professor of bio-chemistry in the University of Cambridge.

The following table gives at a glance the proposed new rations:—

Adult Rations Per Head Per Week.

MEN.	Bread. lb. oz.	Other cereals. oz.	Meat. lb. oz.	Butter, Margarine, Lard, Oils, and Fats. oz.	Sugar. oz.
1. Men on very heavy industrial work or on agricultural work	8 0	12	2 0	10	8
2. Men on ordinary industrial or other manual work	7 0				
3. Men unoccupied or on sedentary work	4 8				
WOMEN.					
4. Women on heavy industrial work or on agricultural work	5 0				
5. Women on ordinary industrial work or in domestic service ...	4 0				
6. Women unoccupied or on sedentary work	3 8				

FOR ALL ADULTS.

The "bread" rations include all flour, whether used for bread or for cooking. Flour may be taken instead of bread at the rate of ¾ lb. of flour for every pound of bread.

The "other cereal" rations include oatmeal, rice, tapioca, sago, barley meal, cornflour, maize meal, dried peas, beans and lentils, and all cereal products except bread and flour. The weight given is the weight of the dry article, as bought. If the full bread ration is not used, the amount saved can be taken in other cereals at the rate of ¾ lb. of cereals for every pound of bread saved.

The "meat" rations include the average amount of bone, which may be taken as one-quarter of the weight of the actual meat. Any parts of meat (such as rump steak, bacon, or suet) which are bought without bone must count for one-quarter more than their actual weight. On the other hand, any bone in excess of a quarter of the actual meat bought may be deducted. Poultry and rabbits may be counted at half their actual weight. The meat rations include suet.

It will be seen that Sir ARTHUR YAPP divides the population into six sections, three for men and three for women. Children are to receive their reasonable ration of essential foods, and, as their needs differ so greatly, a definite ration has wisely been omitted for them. Broadly, the scheme provides more bread but less meat and sugar. The discrimination in regard to individuals in different occupations in life is well in accord with physiological considerations and common-sense. Clearly, the allowance should be highest for those carrying out heavy industrial or agricultural work. Next to be considered come those employed in ordinary industrial work, while unoccupied persons or those engaged in sedentary occupation will admit that the food demands in their case must come last. This class includes the more thoughtful section of the population, and they will recognise the simple truth that the machine which is doing most work requires most fuel. This important point was missed, we think, in previous proposals which provided, for example, an all-round weekly allowance of 4 lb. of bread or its equivalent in flour. Sir ARTHUR YAPP now lays down that men on heavy work should have a weekly allowance of 8 lb. of bread, women 5 lb., men engaged on industrial work 7 lb., and women 4 lb., and sedentary persons (men) 4 lb. 8 oz. and (women) 3 lb. 8 oz. Cereals other than bread are now rationed at 12 oz. per week all round. Previously there was no control in regard to these allowances. The quantity of meat allowed to both men and women is 2 lb., as against 2½ lb. under the former proposals. Fatty foods, butter, margarine, and lard, also were not previously rationed, but now they come under an allowance of 10 oz. per week, to which no exception can be taken physiologically, though the difficulties of cooking are obviously increased. The allowance of sugar was previously ¾ lb., but it is now fixed at 8 oz., where it has been for some time.

These are the principal features of the scheme. Lord RHONDDA, the Food Controller, has definitely stated that unless the new scale of voluntary rations is generally adhered to there is nothing for it but compulsory rationing. We feel confident that the nation will not wish such an undesirable conclusion to the attempts to deal with our food problems in terms free from coercive measures. The rationing suggested is eminently reasonable and designed to inflict no excessive hardship on anyone; it is easily a living allowance. The success of the scheme depends, of course, on the temper of the nation; but that should not be in doubt when the assurance is clear that the allowances set forth are adequate to individual needs.

War-time Prescribing and Dispensing.

WHEN, some three months ago, an order of the General Medical Council was gazetted which deleted from the British Pharmacopœia, until further notice, preparations containing glycerine or sugar, it was suggested in THE LANCET that an authoritative series of formulæ should be established to take the place of those which had been withdrawn. Some such action as this was clearly necessary in order to secure uniformity in dispensing and so obviate the probability of a patient being supplied with two different kinds of medicine dispensed according to the same prescription. Within a short time of the gazetting of the General Medical Council's order the Pharmaceutical Society set in motion the necessary machinery for preparing a series of formulæ, and these have now been published as an addendum to the "British Pharmaceutical Codex," 1911. This addendum contains not only substitutes for pharmacopœial compounds, but substitutes for other commonly prescribed glycerine and sugar preparations, the number of formulæ being over a hundred. Generally speaking, the substances which replace the sugar in the pharmacopœial formulæ are: (1) A mixture of tragacanth, chloroform, and distilled water, known as syrupus factitius or syrup substitute; and (2) diluted glucose, consisting of 90 parts of glucose and 10 parts of distilled water. In cases where these are not used the sugar is omitted altogether, as in cod-liver oil emulsion; in compound liquorice powder the sugar has been replaced by maize or rice starch. Where glycerine has been replaced by tragacanth and chloroform, as in the glycerines of carbolic and tannic acid, the strength has been diminished, since the preparation in its new form is less viscous and more readily absorbed. In a considerable number of preparations it has been possible simply to omit the glycerine. A list of these and specimen formulæ containing sugar and glycerine substitutes is given on p. 766.

It remains to be added that the Pharmaceutical Society has submitted these new formulæ to the British Medical Association, and it has been mutually agreed that as from Dec. 1st the new preparations should be used for prescribing and dispensing all new prescriptions. So far as dispensing under the National Health Insurance scheme is concerned, it is understood that all local insurance formularies will be revised simultaneously on the appointed date by the substitution of the new formulæ for the deleted Pharmacopœial preparations in the place of the ingredients in any formula including glycerine or sugar. This will not entail the reprinting of the formularies if both panel practitioners and pharmacists are instructed by their respective committees that the new alternative formulæ must be used. It will not be necessary for prescribers to concern themselves about the names of these modified preparations, as the original titles have been retained and the doses remain approximately the same. It will suffice, therefore, if the prescriber merely adds W.E.F.—which means, of course, War Emergency Formulary—to the name of the preparation. It has not been possible in many cases to preserve all the physical properties of the original glycerine- and sugar-containing preparation as regards either appearance or taste, and it will clearly be advisable for the pharmacist who dispenses an old prescription containing a sugar or glycerine ingredient to inform his client that any difference that may be noted in the medicine is due to a war-time emergency exchange of adjuvants or other components, and that the activity and efficiency of the medicine have been in no way impaired by the modification.

Annotations.

"Ne quid nimis."

AUTOMATIC WANDERING.

AT the request of the Minister of Pensions the Local Government Board has forwarded to the various boards of guardians a brief Memorandum on automatic wandering. It appears that the Minister of Pensions has had his attention drawn to certain cases of discharged soldiers "suffering from neurasthenia or epilepsy, and that symptom of these conditions which is described as 'automatic wandering,' and is often accompanied by loss of memory." In these cases soldiers have occasionally found their way to Poor-law institutions and have been there detained for observation in the mental ward, and have in some instances, it appears, been sent to a lunatic asylum. The suggestion is made that where any such men are received in a Poor-law institution inquiry should be made of the Special Medical Board for Neurasthenics "to ascertain whether neurasthenia was the cause of discharge from the Army" before arriving at any conclusion as to the disposal of such cases. It is satisfactory to learn that official cognisance is now taken of a difficult class of case, which, though no doubt small in numbers, is deserving of intelligent investigation and in no way merits summary treatment. In the ordinary civilian instances of the condition the diagnosis in practically every case lies between hysteria and post-epileptic confusional states, and to come to a definite conclusion is not always easy. To take the latter first: there may, of course, be a definite history of major epilepsy or obvious evidence of epilepsy, under which circumstances

ifficulties are not likely to arise. There may, however, be but the briefest of *petit mal* attacks, which ave escaped observation and are quite out of proortion to the severity and duration of the confuional state. Where such is the case it is imperative keep the patient under careful observation, and is is the more easy as in post-epileptic fugues the otal duration is certain to be shorter than in many ases of hysterical fugues. In the latter the conition may continue for days, weeks, or months. It ay be associated with a complete change in personlity, as in the historical case of the "Lady of acNish," and in many others recorded by Rayond, Janet, Courtney, Coriat, Morton Prince, Weir itchell, and others. Some two years ago a case ttracted not a little public attention in which a ell-known tennis player was found unlawfully espassing on the Grosvenor-road railway bridge d was sentenced to six months' imprisonment, ut on appeal was able to show that he uffered from automatic wandering. The case as commented on in our columns[1] at the time d its significance noted. Fugues are not mptoms of neurasthenia, properly so-called, but hysteria, and we suppose it may be owing to the exact popular use of the latter term that the thorities seem to be unwilling to refer to it in ficial communications on functional disease. The portance of the Memorandum consists in its peal to medical officers to be on the look-out for rtain of the more uncommon phenomena of rvous disease and to familiarise themselves with e possibility of their appearance. One of the ghest manifestations of medical knowledge is ecisely the recognition of the nature of a case of hich no previous instance has come under the tice of the observer, but if he does not know hat to look for he can scarcely be expected to oid mistakes. Of these undoubtedly one of the ost unnecessary is the transference of an uncognised case of automatic wandering to a lunatic ylum. Signs are not wanting that an outcome of e medical lessons of the war will be a resolve to prove on the, at present, altogether inadequate andard of teaching in nervous and mental disease this country.

CHESTNUTS AND ACORNS IN WAR SERVICE.

THE suggestion that the horse chestnut might be ed to save a certain amount of food material as source of carbohydrate in the manufacture of unition agents has, we believe, been widely acted on, and a substantial collection has been made. an annotation on the subject in THE LANCET of me 16th we pointed out that probably the acorn uld serve a similar purpose, and perhaps this ggestion has caught the attention of the authoies, for recent investigations have been underken which show that the acorn yields even ore carbohydrate than the horse chestnut. a meeting of the Society of Public Analysts d other Analytical Chemists last week Mr. lian Baker and Mr. R. F. E. Hilton communicated interesting paper upon the subject in which e recorded a number of analyses recently ade of chestnuts and acorns. In the chestnut e total amount of starch varied from 21·9 per nt. to 47·8 per cent., and the total sugars m 11·7 per cent. to 19·1 per cent.; in the acorn e starch varied from 55·7 to 57·1 per cent., and e total sugars from 6·8 to 8·98 per cent. The variations in the cane-sugar content, it is pointed out, may possibly be correlated with the degree of ripeness. The diastase in the chestnut behaves like the diastase of an ungerminated cereal. No diastase was found in the acorn either before or after germination. The authors state that acorns or chestnuts, with their full moisture content, yielded after hydrolysis with acid from 11·5 to 12·7 per cent. of alcohol, or 32 to 36 gallons of absolute alcohol per ton of nuts collected. A big collected harvest of acorns and chestnuts, therefore, means that a considerable proportion of food material can thus be replaced by raw products which are not humanly edible.

DOUBLE OPHTHALMIA IN CEREBRO-SPINAL FEVER.

AT a meeting of the Société Médicale des Hôpitaux of Paris, MM. A. Siredey and L. Martin reported a case of cerebro-spinal meningitis with a very rare complication—double ophthalmia.

A domestic servant, aged 17 years, became ill with acute cerebro-spinal meningitis on March 14th, 1917. When seen on the third day she was in a state of violent delirium with opisthotonos. The pupils reacted to light and there was slight strabismus of the left eye. Lumbar puncture yielded a milky fluid containing polynuclear cells and meningococci. An injection of 40 c.c. of anti-meningococcic serum was immediately given. On the following day (March 17th) there was no improvement, and the opisthotonos was so severe that the face was absolutely perpendicular to the axis of the neck. There was slight dyspnœa with some cyanosis. The temperature was 100·7° F., and the pulse 70. A slight degree of conjunctivitis was present. Lumbar puncture was repeated, 35 c.c. of thick fluid were removed and 40 c.c. of serum were injected. On the 18th the patient was worse; the temperature was 102·2°, the pulse was 100, the respirations were 62, and the delirium had given place to coma. The left cornea was completely opaque and of a uniform grey colour, and the ocular tension was reduced. There was slight conjunctivitis of the right eye and the lids were stuck together. Several attempts were made to perform lumbar puncture, but only blood mixed with a grumous, almost caseous, substance could be obtained. On the 19th the right eye was in the condition which has been described in the left, the dyspnœa and cyanosis were marked, the pulse was uncountable, and death took place in the evening.

Metastatic ophthalmia is a rare complication of all forms of meningitis. Contrary to what happened in the case under notice, it usually occurs late in the disease. Abundant exudation forms behind the cornea, and the eye becomes soft from atrophy of the globe. The ocular prognosis is hopeless. As a rule, the ophthalmia is unilateral. M. Netter thinks that the position of the patient has considerable influence in determining the eye which is affected, which is usually the eye of the side on which the patient lies. His view is borne out by the present case. The left eye was the first affected, and the patient constantly lay on that side from the onset of the disease, but on the 18th she began to lie on the right side, and the ophthalmia of the right eye followed.

A NEW MANUSCRIPT OF THE HIPPOCRATIC CORPUS.

OF two classical works attributed to celebrated medical authors probably neither was really written by the assigned author. These are the *περὶ ἑβδομάδων* of the pseudo-Hippocrates and the pseudo-Galen's commentary upon the first 17 chapters thereof extant in an Arabic version. The Hippocratic treatise is of far the higher importance because of its extreme antiquity, it having been alluded to by Plato and numerous authors down to recent times, while the information which it affords of ancient pathological

theories is useful. There is a Greek Codex of the work in the Bibliothèque Nationale; also a Latin version there and in the Ambrosian Library. Our reference to the Hebdomad is prompted by the fact that some fragments of the Greek recension were discovered recently, and these have been studied and assigned to the proper places in the Paris Greek text by Dr. von W. H. Roscher, of the University of Athens. Unfortunately, his book "Die Hippokratische Schrift von der Siebenzahl" is published at Paderborn and so not at present available for scholars here. It is a curious thing that among 110 palimpsests, found in various libraries during the last century, from which some valuable portions of classical literature have been recovered, only one containing eight pages of the "Mulomedicina" of Vegetius, which is in the St. Gall library, is of a medical character. Probably medical works were too useful for their parchments to be sold to the scribes to be cleaned and used over again for theological polemics, and sermons of the early fathers.

ANTIDYSENTERIC SERUM AND SERUM DISEASE.

WITH the production of an antidiphtheritic serum of high potency the appearance of serum disease, so frequent in the early days of antitoxic treatment, diminished almost to vanishing point. But the question will become a practical one again in connexion with a serum which is only potent in massive doses. Sir Patrick Manson, in the new edition of his valuable manual,[1] tells us that this is the case with antidysenteric serum even in polyvalent form. In view of the extensive outbreak of dysentery in the Central Empires—in Prussia alone there were 3802 cases in the third week of September with 550 deaths—serum in large doses is now being extensively used, and the opportunity presents of a fresh study of serum disease. Dr. Gottfried Ewald, consulting physician to reserve troops (Landwehr), deals with the results in an article to which first place is given in the *Münchener medizinische Wochenschrift* for Oct. 9th. He distinguishes reactions, whether immediate or accelerated, and serum disease proper. The former, which have their analogue in experimental anaphylaxis, are hardly ever seen in German reserve troops because, as the author says, their youth was, as a rule, passed in the time previous to the introduction of serum therapy. Once in a patient to whom the author gave on successive days 80, 60, and twice 30 c.c. of serum with a further dose of 50 c.c. ten days later, the last dose was followed in two hours by painful swelling at the site of injection and an immediate rise of temperature. In the case of a young Pole who was known to have received diphtheria serum two years before, and to whom on this account the doctor in charge hesitated to give dysentery serum at all, Dr. Ewald adopted without untoward result the Friedberger method of starting with ½ c.c., giving 15 c.c. four hours later, the same dose the next day, and 10 c.c. on the third day. Occasionally, Dr. Ewald thinks, congenital susceptibility accounts for the immediate reaction at the first injection. As we were familiar with it 20 years ago serum disease is characterised commonly by fever and exanthem of urticarial type: more rarely rashes occur resembling scarlatina or measles, or joint pains, swelling of the lymph glands and of the spleen are noted. The diagnosis from typhoid is occasionally difficult in cases with continued high temperature, but the leucopenia of typhoid, although occasionally simulated in serum disease, is much less constant. The incubation period is generally given as 8 to 12 days, but in Ewald's experience was much more variable, at shortest 3 to 4 days, and reaching rarely 14 to 18. Five to 15 days were the more usual limit. He found no difference in the incidence of serum disease from the use of the Höchst serum, the Oberursel serum of Gans, or that of the Saxon Serumworks, and his general conclusion is that no one should be deterred from giving dysentery serum by the fear of anaphylactic reaction, especially as the Friedberger anti-anaphylactic method seems to be effective in critical cases.

A NURSES' BENEVOLENT FUND.

AT the request of Sir Arthur Stanley, chairman of the College of Nursing, Limited, the British Women's Hospital has undertaken to raise money to serve the double purpose of an endowment fund for the training of nurses and of a benevolent fund to assist nurses who have suffered mentally or physically in the war. The fund is to be called the Nation's Fund for Nurses, and judging from the success achieved by the British Women's Hospital in raising money for the Star and Garter Home at Richmond their present appeal is likely to meet with the response which it deserves. The question of the relation of this fund to the provision made for nurses in the new Royal Warrant came up in the House of Commons.

Major Chapple asked the Parliamentary Secretary to the Ministry of Pensions whether his attention had been drawn to an invitation for subscriptions to provide endowment for the College of Nursing and a benevolent fund for individual nurses themselves; whether he was aware that this appeal was supported by Sir Douglas Haig on the assumption that the funds so subscribed were to be used for nurses who had lost their health during the war, and that Sir Douglas Haig said that this was most necessary; and whether he would state fully what the Government proposed to do for nurses in order that the nursing profession might be relieved from anxiety in the matter and in order that the subscribing public might know whether the immediate financial need was for a college for the training of women not now nurses or for the help of nurses who had served in the war and had suffered in consequence. Sir A. Griffith-Boscawen replied that he had seen in the newspapers a notice of the fund referred to. He said that the provision made by the State for nurses disabled through war service was set out in the Royal Warrant of August 1st. This provision was on far more liberal a scale than previously, and he did not doubt that the organisers of the fund would take account of the assistance provided by the State in deciding how their funds might best be applied.

It is quite certain, however, that the Royal Warrant will no more meet all the hard situations met with among nurses than it will do so in the case of doctors; and as we have appealed to the generosity of the public in regard to the medical War Emergency Fund, so we do now on behalf of the Nation's Fund for Nurses.

Dr. Alexis Carrel, who was to have delivered the Harben Lectures at the Royal Institute of Public Health in the last week of this month, has been detained by official demand in America.

FOOD ECONOMY.—In connexion with the League of National Safety, which has been formed as part of the Food Economy Campaign, Lady Hunter, the wife of General Sir Archibald Hunter and honorary president of Ladyworkers, will organise voluntary lady helpers to deal with the application cards as they are forwarded to Grosvenor House.

PERFUSION OF THE HEART WITH NICOTINE.

BY D. T. BARRY, M.D. R.U.I., F.R.C.S. ENG.,
PROFESSOR OF PHYSIOLOGY, UNIVERSITY COLLEGE, CORK.

THE action of nicotine on the heart has been investigated by many workers, whose attention has chiefly been directed to the results of dropping the drug upon its surface in various concentrations or by injection into the circulation. A few well-known works bearing on this may be quoted from at the outset.

Pembrey and Phillips[1] state that injection of the drug into the circulation of a frog causes the heart to stop with the ventricle contracted and the auricles engorged with blood. Dropped on the heart in a 0·1 per cent. solution, these observers say that it causes slowing in two or three minutes, and when this occurs stimulation of the vago-sympathetic nerve, which previously stopped the heart, is now incapable of causing arrest, while stimulation of the crescent still causes stoppage. This is interpreted as a paralysis of the pre-ganglionic fibres of the vagus, while the post-ganglionic fibres are unaffected.

Brodie[2] shows a record in which slowing is caused by a weak solution in a few seconds. He states that the drug first stimulates and then paralyses nerve cells and strong doses paralyse nerve fibres.

Stirling[3] says that even with a full nicotine effect sinus stimulation causes acceleration due to excitation of accelerator fibres which have no cell in their course in the heart. There is no account of an appreciable stoppage of the heart under its influence, but permanent arrest by a drop or two of pure nicotine.

In the experiments here about to be recorded the frog's heart was systematically perfused with nicotine in varying strengths and a large number of observations made on more than one hundred hearts of *Rana temporaria*. Some hundreds of graphic records have been obtained.

Method.

The special cannula previously described by me[4] was inserted into the vena cava below the liver as described by Mines.[5]

The nicotine was mixed with Ringer's solution and neutralised with dilute sulphuric acid until the CH was about 1×10^{-8}, as shown by indicators. Neutralisation is important, as the degree of alkalinity of even a very weak solution of nicotine has a deleterious action.

The velocity of flow of the perfusing fluid could be varied by altering the levels of the flasks by a rack and pinion adjustment, a range of 1 to 4 c.c. per minute being given, which was uniform in all three flasks.

The effects of stimulation of the vago-sympathetic nerve, of the intracranial vagus and of the sympathetic, independently, were tried carefully in many instances before, during, and after nicotine action. In this connexion it is necessary to mention that vago-sympathetic stimulation often gives a different result in the heart which is being perfused with Ringer's solution from that given before perfusion was begun. (Fig. 1.) The same applies to stimulation of the intracranial vagus. The lower the pressure of perfusion the greater is the resemblance between the pre- and post-perfusion stimulus. Attention has also been called to this by Ponirovski.[6] Even the tension of the lever threads, especially in the case of the auricle, when no perfusion is taking place, tends to cause escape.

A standard stimulus was employed throughout, the secondary coil being fixed in one position and the primary current from a couple of Leclanché's cells regularly tested with a voltameter. Of 50 frogs examined during the month of March arrest of the heart beat, varying in duration from a few seconds to a minute, was elicited by a vago-sympathetic stimulus in 30. Many of these when perfused and attached to the levers exhibited merely some slowing as a result of the stimulus, but about half of them showed acceleration instead. (Fig. 1.) This record[7] shows that the vago-sympathetic effect in the empty heart (the aortæ were cut) is much slowing, with a great fall of ventricle tone. The ventricle lever was raised between the arrows as it fell on to the signal marker. At the first gap in the tracing the cannula was inserted into the vein and perfusion be The third signal shows the changed response to the s stimulus—viz., a marked augmentor effect. The rest of record will be referred to later.

After 10 or 15 minutes' perfusion the inhibitory effe often restored or restored in part; at any rate, after interval the response is pretty uniform.

Action of Nicotine.

It is considered by many that nicotine affects nerve chiefly, with little or no depressing action on nerve fi Stirling's[8] observation that accelerator nerves are active with a full nicotine effect suggests the quest What is meant by a full nicotine effect and how i established? One or two minutes' perfusion with a st solution, such as 0·5 or 1 per cent. of nicotine, will alv cause complete arrest of the beat for several minutes, loss of irritability of the muscle, and in this phase, of cou there is no contraction, not to mention acceleration, fro muscle stimulus. The stock of material for contractio not altered in amount by drugs, as mentioned by Burrid Nor is it diminished by 1 or 2 c.c. of a 0·5 per cent nicotine, so that the contractions return spontaneousl such a case, and when they do a stimulus which, prio nicotine action caused acceleration, now fails to do whether it be through nerve or muscle. (Fig. 2.) record shows that even a 0·2 per cent. solution can dep accelerator fibres. Of course, it is possible that acceler action here is merely counterbalanced by inhibitor stim tion at the same time, but this would apply to the nicotine stimulus also. Stimulation of the sympath alone has been noticed often to be without effect on during nicotine action. First, acceleration caused b vago-sympathetic stimulus, next the effect of the nicotir shown, and after some recovery from this the same stim fails to cause any acceleration, which it does cause, h ever, again (third signal) on washing out the drug Ringer's solution at R. Beyond raising the auricle l slightly from the great sweeping movements of the lc one at the thick lines and stopping the drum at S and R about half a minute nothing was changed throughout ex the perfusing fluid.

The action of nicotine may be considered from diffe standpoints. Taking the two factors, (A) nerve and (B) mus the relative importance of which in cardiac phenomena given rise to much discussion, the former exhibits inhibi and excitor elements and the latter has to be subdivi into auricular and ventricular muscle and the muscle necting the two, which for convenience is here referred t the A.V. bundle.[10] The effect of the drug, too, on the put of the heart in a certain phase of its action has b tested, and this effect is in the direction of increased w The cardiac effects of the drug are certainly worthy of c attention, whether we consider them as applied specific to the elucidation of the many secrets still remaining in heart mechanism, practically all possible factors in wl are influenced by it more or less independently, or as more general significance of the phenomena observed. principal immediate effects of a 0·5 per cent. solution h been already stated, but attention has been chiefly dire in these experiments to weaker solutions—namely, 0 1 0·2 per cent.—which it will be well to consider first general way.

On a fresh heart the effects of a 0 1 per cent. solutio nicotine are somewhat as follows: Slowing of the rate in usually before the end of the first minute, with or witl a previous acceleration; the auricle beat is increasec amplitude, while that of the ventricle is shortened and sh incomplete diastole. This weak solution if dropped on heart while it is being perfused has very little effect on rate and causes a very slight tonus or none. It requir strength of nearly 1 per cent. to cause an appreciable when dropped on the Ringer perfused heart, while in mediate solutions of 0·2 or 0·3 per cent. used by drop generally cause some slowing and increase of auricle bea like case.

Though the heart becomes inured to the drug in suc way as to recover much of its normal condition unde

[10] In the anatomical sense the connecting muscle between au and ventricle in the frog's heart is not a bundle, but it is physiologi equivalent to the mammalian bundle, and the designation is adh to because it is less confusing than other terms.

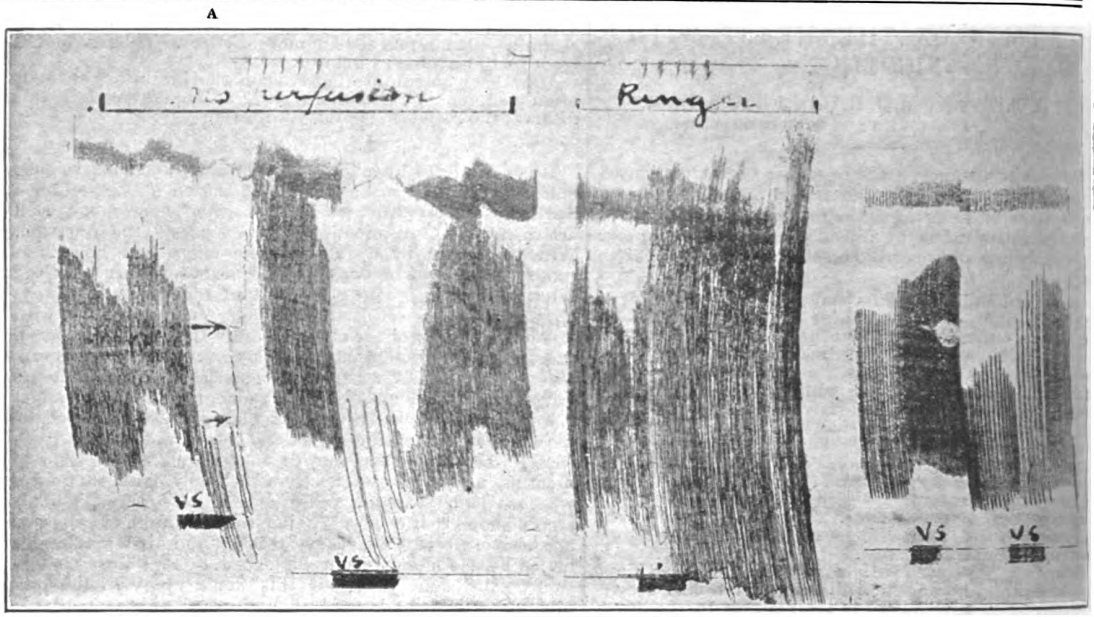

FIG. 1.—Effects of vago-symrathetic stimulation with and without simple perfusion. Slowing and loss of tone (first two signals) without perfusion. Augmentor effect with perfusion (third signal). The last two signals represent the same stimulus in recovery from nicotine.

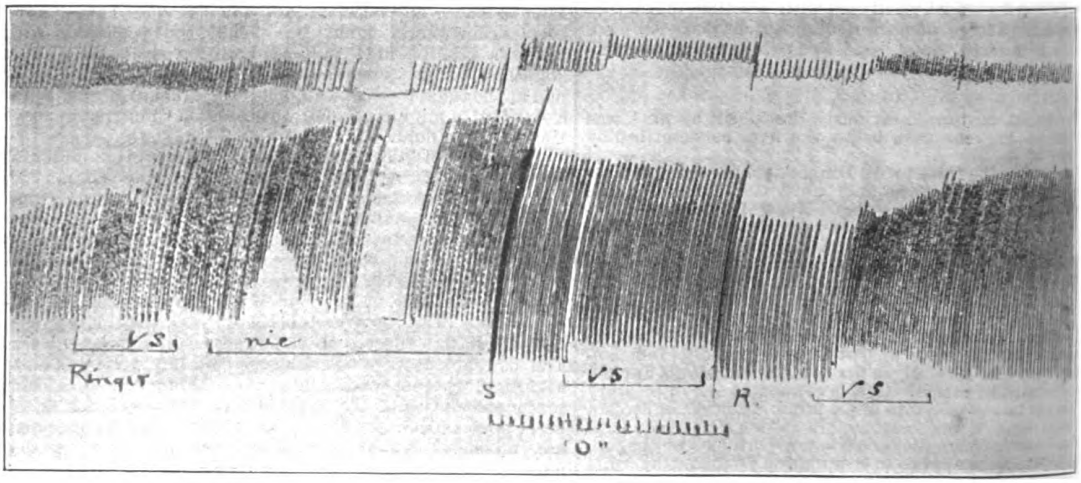

FIG. 2.—Vago-sympathetic stimuli (v.s.) causing acceleration before and after nicotine effect, but not during this.

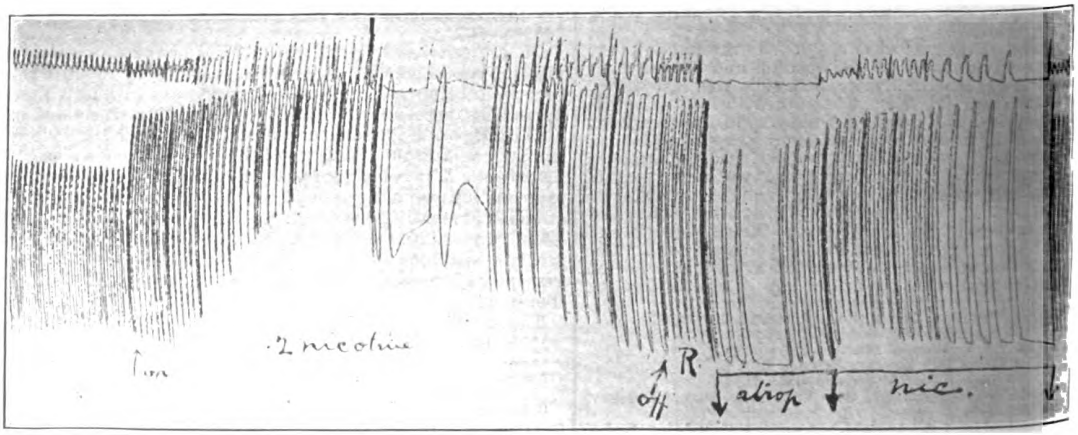

FIG. 3.—Effect of 0·2 per cent. nicotine before and after atropine. Strong atropine perfused about three minutes between arrows. Nicotine action as before, but less tonus.

continued action, it does not always show an improvement on its pre-nicotined state; but it frequently shows for a varying time a larger beat if the nicotine be replaced by Ringer's solution after the first minute, and in this phase it is capable of performing increased work, as referred to above and as dealt with later on.

A 0·2 per cent. solution acts similarly to the above, but with a more pronounced effect. The steps of the action resemble those described for 0·1 per cent. up to a certain point—that is to say, slowing and increased tone of the ventricle—and after a while a complete cessation of beat. (Fig. 3.) The time of onset of this arrest varies from one to four minutes, and its duration with continued nicotine perfusion is from one to three minutes.

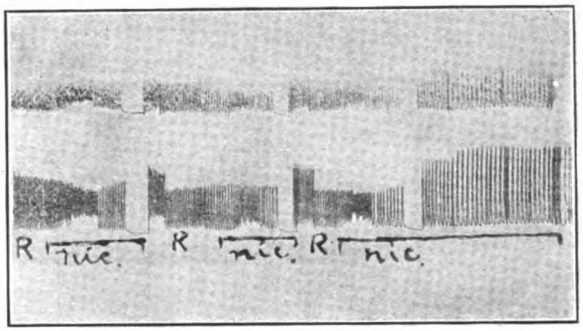

FIG. 4.—Three applications of 0·2 per cent. nicotine each after thorough Ringer washing at R. The accelerators are stimulated in each case. Drum stopped a few minutes at each break.

A. *Nerve.*

Acceleration before slowing is not invariable, but quite common with a 0·2 per cent. solution, and still more frequent with 0·5 per cent. If acceleration is observed once in a particular heart it occurs again and again in this with the same nicotine solution after a thorough washing out with Ringer's solution, and this consistency is also shown with the other phenomena, in degree, duration, time of onset, &c. (Fig. 4.) Three arrests of the beat by 0·2 nicotine are shown after a preliminary acceleration and slowing. The drum movement was stopped in each case soon after the beat ceased, and this was allowed to recover under the action of the alkaloid. Then a "step" of the recovered contractions to the mark R, where washing out took place. The strong contractions at the end occur under continued nicotine perfusion.

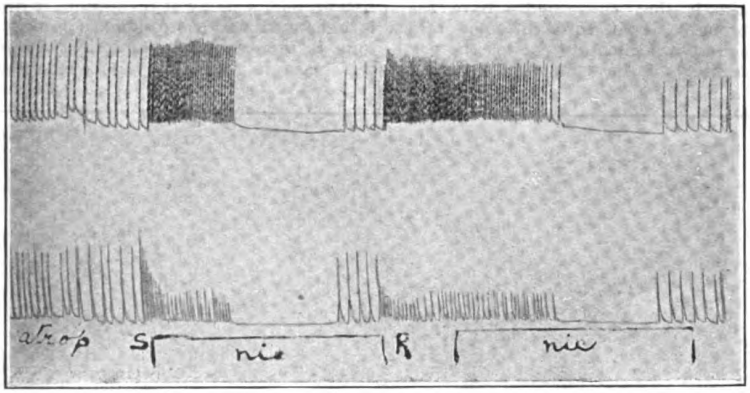

FIG. 5.—Irregular slow beat caused by strong atropine perfusion which ceased at S. Then 0·2 per cent nicotine stopped heart in two minutes. Same effect later when all atropine washed out (R).

Acceleration by nicotine has been noticed by other observers and has been attributed either to the presence of sympathetic cells in the heart (Cullis and Dixon [11]) or to its action on part of the neurone as well as on cell body (Dale and Laidlaw [12]). A preliminary acceleration by 0·2 per cent. of nicotine is shown by a large proportion of the records. This double action of nicotine is, I think, uniform in all the structures affected by it in the heart.

An endeavour will now be made to show that this is true for the other nerve elements and for muscle. The period of slowing follows that of acceleration, and is occasioned by an excitor effect on the inhibitory mechanism, as stated by many observers. But their explanation of the full continued effect of nicotine on this mechanism is not quite satisfactory in the light of the results about to be referred to.

If the inhibitory effect, slowing and cessation of beat for a time, is due entirely to action on ganglion cells or preganglionic vagus it should be abolished by something which could be relied upon to suppress vitality in these parts, such as atropine. It is said that they are paralysed in the heart by 0·001 mg. of this, and perfusion with atropine solutions representing this dose, administered in the course of a few minutes, was tried as a preliminary to nicotine action, but without effect. Stronger solutions of atropine were next tried, and not until 0·05 per cent. solution was reached was any appreciable antidotal effect noted, beyond lengthening the time of onset of slowing. With this and stronger solutions (yielding about 5 mg. per minute or more) there is a depressing action on muscle. (Fig. 5.) The result in all cases of atropine perfusion was that it never prevented the slowing caused by nicotine, though in strong solution it sometimes diminished the degree of slowing as well as prolonging the time necessary for its onset. This nicotine effect is very like the usual one, and

[11] Cullis and Dixon: Jour. of Physiol., 1911, xlii., 156.

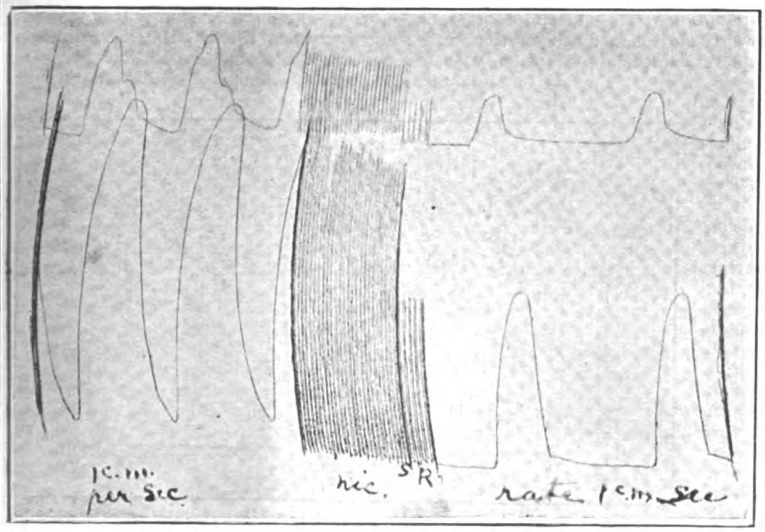

FIG. 6.—Augmentor effect with reversed beat. Normal beat at R.

[12] Dale and Laidlaw: Jour. of Physiol., 1910, xli., 1.

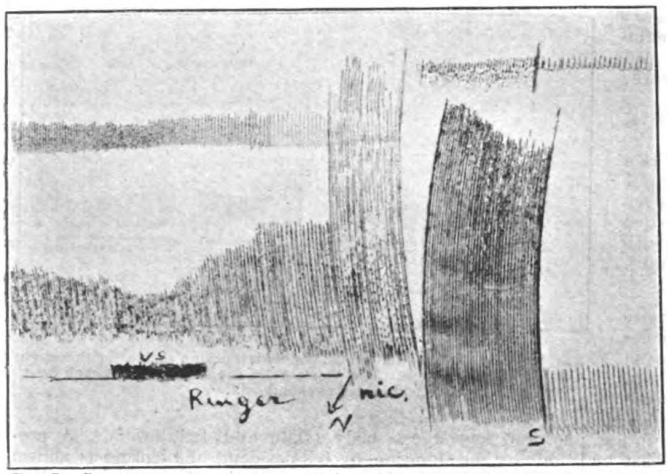

FIG. 7.—Great force of beat due to nicotine when applied after vago-sympathetic stimulation. Perfusion stopped half an hour at S.

the slowing, if we take it that the ganglia have been paralysed, must be brought about through some other channel. If, as has been shown, nicotine excites the post-ganglionic fibres (accelerator) of the sympathetic, there is no reason to suppose that the inhibitory post-ganglionic fibres are not also stimulated by it, whether we regard it as acting on nerve trunk proper or on receptive substance (Langley [13]).

Considering it well to leave no doubt of the failure of atropine to counteract nicotine slowing the former was perfused in still stronger solution, 0·1 per cent., until the muscle showed unmistakable signs of deterioration. These stronger solutions of atropine bring about a marked slowing of the heart and deterioration of the muscle metabolism, which is more marked in the ventricle, and augments this depressing effect of nicotine, but the slowing or stopping action of the latter is practically unaffected. (Figs. 3 and 5.) The latter shows a hypodynamic ventricle where perfusion with both drugs had been alternately performed for about an hour; a 0·2 per cent. nicotine stops the heart in about two minutes. This is again washed out at R, and again nicotine shows the same effect as previously. The depressing action can be intensified in the auricles by running a stout needle through them which establishes a leak, and this determines that the auricle muscle suffers most with low perfusion pressure. Nicotine in this case stops the heart as before, and it resumes with increased pressure (nicotine + Ringer).

The slight counteracting effect of atropine may be due to the fact that nicotine excites both ganglion cells and post-ganglionic fibres, whereas atropine does not affect the latter. The modified nicotine response given in some instances after large doses of atropine may be accounted for by supposing that in strong solution atropine depresses post-ganglionic fibres without completely abolishing irritability in them.

The purely augmentor fibres in the heart are also stimulated by nicotine, and this effect probably outlasts that on the other nerve elements. It is held in check or antagonised during the excited state of the inhibitory fibres, and if the latter condition is curtailed or prevented by turning on Ringer's solution before it is due to come on, the greatly increased force of the beat is seen. (Fig. 6.) It is also sometimes seen after the full effect of the nicotine solution, and may occur with a reversed rhythm—to be referred to directly. The record shows the reduction of the beat to normal after half an hour's delay at S (stationary drum). Augmentation is enhanced and more quickly brought out if sympathetic tone is increased by stimulation beforehand. (Fig. 7.) In this case it was the vago-sympathetic trunk that was stimulated (signal) during Ringer perfusion; this causes acceleration and some increased force. Half a minute's perfusion with 0·2 per cent. nicotine at N now gives a very pronounced augmentor effect. The levers being

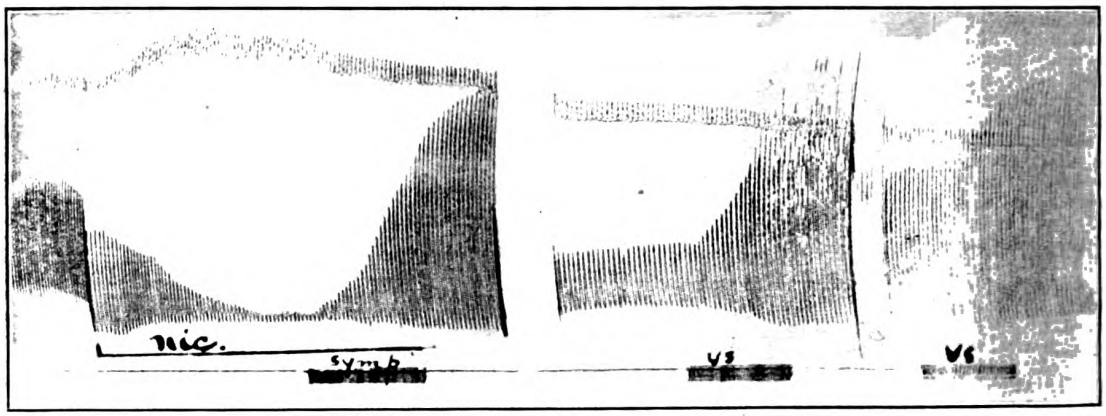

FIG. 8.—Failing ventricle in nicotine action restored by sympathetic stimulation; also strong augmentor effect of vago-sympathetic on ventricle. (Signals 2 and 3.)

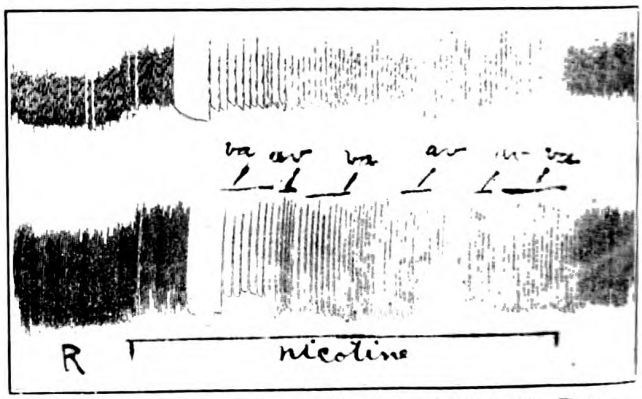

FIG. 9.—Alternation of A.V. and V A. rhythm during nicotine action. The auricle leads in the fast groups and the ventricle in slow portions.

[13] Langley: Jour. of Physiol., 1906, xxxiii., 374.

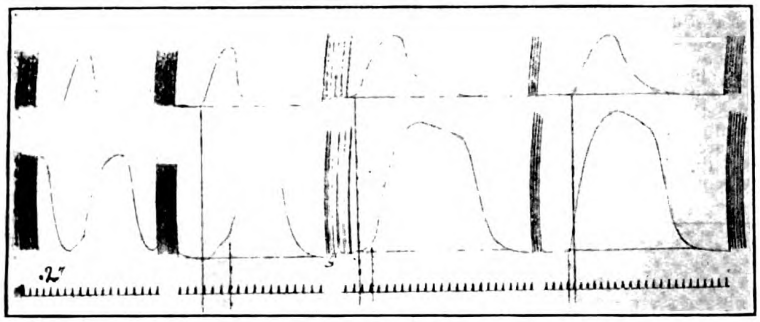

FIG. 10.—Reversal of rhythm by nicotine. The A.V. interval is seen to be shortened before the ventricle takes up the lead in the cycle.

half-rhythm, irregularity, &c. The effect of a failure of output by the ventricle is well shown by the auricular tension. The first signal represents stimulation of the sympathetic nerve. A few inches of the tracing which were without interest were cut out at the gap and the vago-sympathetic this time stimulated (second signal) some ten minutes after the sympathetic (the sympathetic stimulus was applied below the vagus ganglion; the vago-sympathetic stimulus to the trunk of the nerve high up). Again we have a pure augmentor effect which is repeated ten minutes later on (third signal). The effect is confined to the ventricle, and points to independent augmentor impulses to that chamber.

adjusted at the gap in the record, where a portion was cut out, a further step is shown, and finally the return to a low condition without perfusion which had been stopped for about half an hour at the point S. The inhibitory elements are, of course, stimulated by the electric current as well as the augmentor, but we may suppose from the result that the balance of increased tone is with the latter, and the nicotine effect on this is more marked than on the other.

This phase of nicotine action resembles rather the effect of adrenalin in the great size and force of beat than that of digitalis or veratrine. In it the rate may be fast—viz., 60 per minute—or comparatively slow, about 15 to 20 per minute. The accelerators are quickly stimulated (pure acceleration is often the first sign of the drug effect) and recover quickly from succeeding depression; they recover sooner than the inhibitors. (Fig. 1.) The last two signals (Fig. 1) show stimulation of the vago-sympathetic nerve with an interval of two minutes or less in recovery from perfusion with 0·2 per cent. nicotine. Acceleration in the first of these is shown changed to slowing and increased force in the second, but only in the ventricle. During the acceleration response the inhibitor elements were still in the depressed stage, but two minutes later they have recovered sufficiently, not only to prevent an accelerator effect, but to cause some inhibition at least in the ventricle.

The augmentor fibres may remain active when the accelerators seem to be out of action in continued perfusion, and even when the muscle metabolism shows marked signs of deterioration. (Fig. 8.) In the first part of the tracing the ventricle beat is falling off quickly, which is one way of showing its depressed metabolism; other ways in which this is shown are the alternating pulse,

So in this, after nearly an hour of perfusion with a 0·1 per cent. solution of nicotine, the augmentor fibres to the heart are still active. The period of depression in them supervenes sooner or later, as in the other elements. There may be a temporary depression which is quickly recovered from even under continued action of weak nicotine, or there may be no depression period with a weak solution until after prolonged action. As already shown, there is evidence of accelerator depression by 0·2 per cent. nicotine (Fig. 2), and it is evident that there is no augmentor effect of stimulation at this time either.

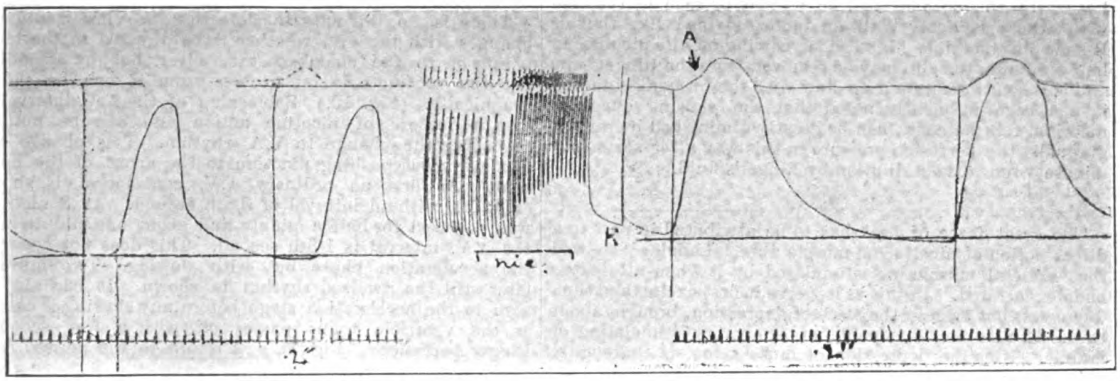

FIG. 11.—Reversed rhythm quickly established in accelerator phase of nicotine. Ringer solution was perfused for a few seconds to reduce tonus at R. A beat begins at arrow.

This greatly increased force of the beat suggested a test of the amount of work done by the heart and how far it might be increased by nicotine stimulation. The method adopted was a very simple one.

A glass tube 40 inches long, of about 4 mm. diameter, was drawn out to a cannula at one end, and this was inserted into the left aorta of the frog, while the right was tied off or clamped. The tube was then placed in a nearly vertical position and the fluid expelled by the ventricle mounted up its interior in a series of intermittent movements according to systoles. Testing the normal heart on Ringer's solution with a supply of 3·5 c.c. per minute, the fluid rose to a height

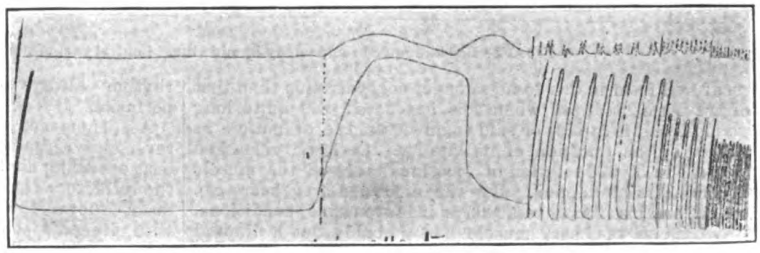

FIG. 12.—Double auricle beat in reversed rhythm. Description in text.

(vertical) of 20 inches on an average, beyond which the heart failed to send it. Lowering the perfusion bottle to relieve the auricular stress and to give the heart a rest did not alter the fluid in the tube, which was kept up by the aortic valve. On further trial no increased work was done, but now, after lowering the perfusion bottle to relieve once more, the Ringer's solution was shut off and 0·2 per cent. of nicotine solution turned on for half a minute with the same feed. As a result of this the heart-beats were much augmented and the fluid was soon driven higher, with greatly increased strokes, until it passed right over the top (vertical height over 30 inches). This result was obtained frequently.

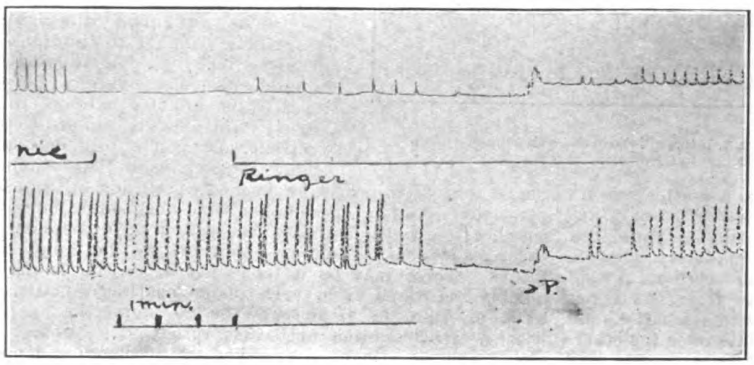

FIG. 13.—Independent ventricle rhythm. Recovering auricle causes extrasystoles. After four of these the independent contractions in ventricle suppressed.

A very high pressure is without ill effect on the heart after this dose of nicotine, as may be seen by the ease with which it deals with an increased feed like that of Ringer plus nicotine. Instead of cutting off the nicotine in half a minute, the clip may be removed from the Ringer tube and this solution allowed to flow with the former. Indeed, it has been frequently noted that the slowing effect of nicotine, 0·2 per cent., can be greatly diminished by raising gradually the perfusion pressure in this way after some half minute even without dilution by Ringer's fluid.

B. *Muscle.*

The great force of beat has to be attributed in part to a direct action of nicotine on muscle fibre. Langley[14] showed that skeletal muscle was stimulated by it when all nerves had degenerated. In this as in nerve it first excites and then depresses, but even in the state of depression, brought about by itself, nicotine is capable of temporary stimulation of muscle. Nicotine depression of muscle, too, is thoroughly

independence of nerve, and the stock runs down when nerve influence has been long removed.

Generally speaking, ventricular muscle is more susceptible to the influence of nicotine than auricular, and shows the first signs of defective metabolism, as well as the more marked response (tonus and increase of beat) to the exciting action. The auricles and ventricle sometimes recover from nicotine stop at different times, the auricles, for instance, resuming their beat some time before the ventricle. But we can determine a stronger action on the auricle by perforating as before mentioned, so that its muscle and nerves are more affected and the ventricle beats independently. In such a case the auricle beat when resumed nearly always follows the ventricle—that is, a reversed rhythm. This reversal, too, frequently occurs in recovery from nicotine stop without perforation of the auricles, and in the progress of recovery there is often a struggle between the two chambers for the lead. (Fig. 9.) The accelerated patches in the record are those where the rhythm is A.V., and the slower those of the V.A. sequence. At the change from the former to the latter an auricle beat is missed and sometimes two. With reversal, too, the auricle may cease to beat altogether for a time, while the ventricle beats alone. Reversal is more common when nicotine perfusion is kept up than when replaced during the stop by Ringer.

There is no difficulty in detecting the last-mentioned changes with the eye, whether it be directed to the lever points or to the chambers themselves, but by spreading out the contractions on a fast drum it can be shown graphically. (Fig. 10.) Shortening of the A.V. interval is also a feature of nicotine action and can be noticed preceding the change to V.A. rhythm. This change can occur without pushing nicotine to the arrest of the heart beat. At first an ordinary A.V. contraction is shown (Fig. 10) with an interval of 3/5th second. At S nicotine was perfused for half a minute and about one minute later the A.V. interval is 1/5th second. This does not occur in the acceleration phase but with slowing. Two minutes later still the reversed rhythm is shown. It can also be seen in the acceleration stage before any slowing is caused as the ventricle tonus passes off with a few seconds' Ringer perfusion. (Fig. 11.) A return to the normal A.V.

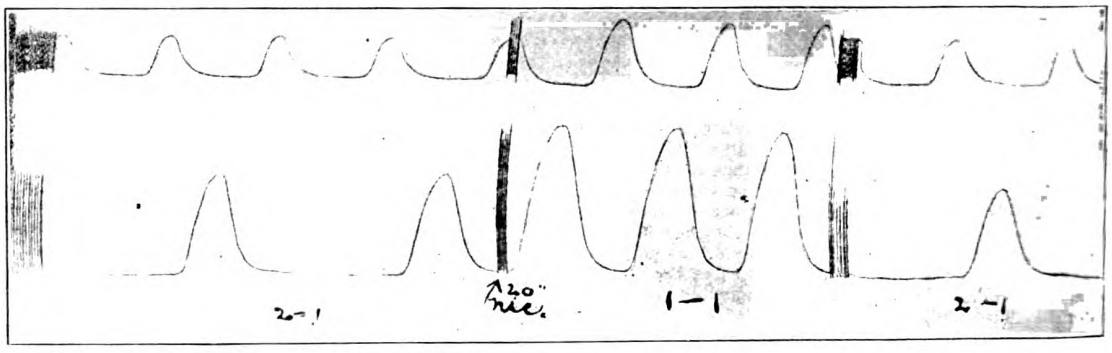

FIG. 14.—Block removed temporarily by nicotine. Central part of nicotine shows a 1:1 rhythm.

recovered from if due to no stronger concentration than that of 0·2 per cent., even when this has acted over quite long periods, and it cannot be said to affect the life of muscle as judged by the duration of its vitality. Carlson[15] remarked that a 1 in 50,000 solution of nicotine depressed the muscle of the heart of limulus. But the nicotined frog heart can go on beating for several days in favourable conditions. Rhythmicity of heart muscle has probably but a limited

rhythm always occurs with a few minutes' Ringer perfusion.

A phenomenon which has been frequently observed in this reversal is a double beat in the auricle (Fig. 12), the second beat occurring at the height of ventricular systole and during the refractory period of the latter. The fast movement of drum shows the beat first to be reversed. Perfusion with Ringer's solution for one minute does not alter the rhythm (it is still V.A.), but it changes the appearance of the auricle tracing. Two minutes' perfusion at the next stop

[14] Langley: Loc. cit.
[15] Carlson: Amer. Jour. of Physiol., 1906, xvii., 177.

gives the ordinary rhythm (A.V.). The significance of this double auricle beat is that the first is dependent on ventricular contraction which has been established as leading the cycle by some influence of the drug on its ordinarily subordinate mechanism. The higher mechanism, ordinarily predominant, is now recovering, and the second beat is an indication of this; the stimulus from this second beat falls during the long refractory period of the ventricle and fails to excite it. The condition is interesting from its bearing on de Boer's [16] work, who attributes to this long refractive phase the chief rôle in bringing about halved rhythm with veratrine, &c., while the view of Engelmann [17] and others is that the halved rhythm is caused by lowered conductivity from auricle to ventricle.

As a contrast to this we may examine another state where the ventricle is beating independently of the auricle, the latter being brought to a standstill, as already explained. (Fig. 13.) Here the recovery of the auricle takes place without reversal—that is, independently of the ventricle mechanism, which is not strong enough to determine it. The auricle beats, in this case occurring after the refractory phase of the ventricle, cause extrasystoles in the latter, until it takes up its normal secondary habit of following the auricle, as shown by the last two beats before the interval. The heart then ceased to beat, probably because the perfusion pressure was low; when this was raised at P the ordinary A.V. rhythm was established in a couple of minutes. The last of the extrasystoles is followed by a longer compensatory pause than the others, and during this the auricle assumes command, and this to the extent of stopping the ventricle with it when it ceases to beat. This group of auricle beats is characteristic of recovery when cessation has occurred in either chamber, isolated contractions taking place irregularly before ordinary rhythm is re-established. The last two ventricle beats before the stop are a continuation of the extra series, the automatic contractions being suppressed.

A halved rhythm can be temporarily changed to 1-1 by nicotine in lowered ventricle metabolism (Fig. 14), and this may be interpreted in many ways. The drug may increase the conductivity of the connecting muscle (dromotropic), and thus break down a block as it is generally understood, or it may increase the irritability of the ventricle (bathmotropic or inotropic), though the refractory period with larger beats would tend to increased length. The stimulus from the auricle, too, is stronger because of the stronger contraction.

That the second beat in the auricle may possibly be caused by closure of the electric change accompanying the ventricle contraction has to be considered, though the explanation given is the more likely one.

Reversal of the heart rhythm in the turtle has been caused by Laurens and Gault.[18] Conjoint stimulation of the vagus, which is separate from the sympathetic in the neck, and of the funnel connecting auricle and ventricle led to this V.A. beat. Stimulation of the sympathetic changed this back to the normal rhythm. There was no change of rate, but the force of auricular contraction was less.

In the nicotine reversal in the frog stimulation of the sympathetic seems to be without effect in converting to normal; it was certainly without immediate effect when tried in a few cases. We may suppose that the nicotine stimulation to predominance of the usually dependent mechanism of the ventricle is at least in part due to its stimulating action on ventricle sympathetic elements exceeding that on the auricle, while the inhibitory effect would be more potent in the latter. As already remarked, there is evidence of independence of action of ventricle augmentor elements. (Fig. 8.)

Schlomovitz and Chasé [19] tried to abolish the automaticity of the sino-auricular pacemaker in the turtle with nicotine and atropine, but did not succeed, and for this reason they concluded it was independent of nerve. There is no doubt, however, that nicotine causes a reversal of rhythm as here described. It has been seen many times.

As already stated, the A.V. interval is shortened in certain phases of nicotine action. If this interval is due to delayed conductivity of the contraction wave in the intermediate region then nicotine shortens it by increasing the conductivity. It is likely that the drug shortens the latent period of ventricular muscle, but this has not as yet been verified.

Conclusions.

Nicotine in weak solution, 0·1 and 0·2 per cent., which has been neutralised, perfused through the hearts of frogs gives results which are fairly uniform, though certain variations occur.

The first effect in a majority of instances is pure acceleration of the beat which is usually seen in less than half a minute from the introduction of the drug. This gives way to slowing, a phase in which increased force of the contractions is also seen. When acceleration is not in evidence increased force is usually exhibited alone within the first half a minute, or both may occur together. The stimulation of accelerator fibres is soon followed by depression, and this double action is believed to be true of nicotine on the different elements responding to it.

Slowing of the beat leads to a definite stop lasting one or a few minutes, but this is not common with solutions of less than 0·2 per cent. After a period of quiescence the heart resumes its beat with a rhythm which may be irregular or regular, the amplitude of contraction being usually greater than before. The contractions are now often reversed—viz., apex to base sequence, and this is more common after stronger solutions of nicotine, 0·5 to 1 per cent.

With 0·5 to 1 per cent. solutions cessation of beat occurs sooner than with weaker solutions, and lasts longer. With a solution of less than 1 per cent. it resumes beating spontaneously after arrest, with nicotine perfusion kept up, though this is not always so.

The slowing of the beat and arrest for a while is due to stimulation of the vagus endings. The failure of atropine to counteract this points to stimulation of post-ganglionic fibres. This resembles its effect on the sympathetic side causing acceleration.

The augmentor fibres are also stimulated by nicotine, and the succeeding depression is short-lived or may be much delayed. Evidence is given of their activity in certain stages of nicotine effect, when inhibitor and purely accelerator factors seem to be suppressed. The activity of augmentor fibres to the ventricle seems to be possessed of a certain degree of independence, in consequence of which they may constitute the chief factor in independent ventricular rhythm.

The work done by the heart can be increased by nicotine stimulation. This is in part nervous and in part muscular in origin.

The delay in the passage of the contraction wave from auricles to ventricle is reduced by nicotine, in some instances independently of acceleration, and is frequently seen to lead to a reversed rhythm. The usually subordinate ventricle mechanism is stimulated to predominance in the cycle.

Though all of the phenomena mentioned have been observed many times, the only one which may be said to be unfailing in its appearance is slowing and arrest of the beat in proportion to the strength of nicotine used. Very strong doses of atropine do not abolish this.

Cork.

THE LATE MR. FREDERICK E. FENTON.—Mr. Fenton, who died at his residence, Uxbridge-road, Ealing, on Oct. 16th, aged 64, was born in Chelsea, and received his medical education at St. George's Hospital and in Paris. He qualified in 1878, and later took the Fellowship of the Royal College of Surgeons and the Membership of the Royal College of Physicians of Edinburgh. He commenced practice in Ealing at a time when that place still retained some of the characteristics of a Middlesex village in the neighbourhood of London. By his all-round ability he soon gained for himself a good position professionally and the esteem of his neighbours. He was prominently associated with the Cottage Hospital at Ealing, and later became surgeon to the Western Skin Hospital and to the King Edward Memorial Hospital at Ealing, being later appointed consulting surgeon. Among his other active interests was that of the Volunteer movement, and he served in the Queen Victoria Rifles for 22 years, retiring with the rank of Surgeon Lieutenant-Colonel, with the Volunteer Decoration. A good French scholar, he translated from the French M. Duval's "Artistic Anatomy." He leaves a widow, a daughter, and a son, who is a member of the medical profession.

WAR EMERGENCY FORMULAS:

AN ADDENDUM TO THE BRITISH PHARMACEUTICAL CODEX 1911.

IN this new addendum are contained temporary formulas for preparations which normally contain sugar or glycerine or both. The substitutes are generally either :

(1) Syrupus factitius, consisting of

Tragacanth in powder ...	0·7	Distilled water... ...	to 100·0
Chloroform	0·5		

or (2) Diluted glucose, consisting of

Glucose	90·0	Distilled water	10·0

Preparations formerly containing sugar.—It will be useful to note the directions for preparing some of the more commonly prescribed sugar compounds. Confection of senna contains 45 grammes of glucose in the place of 40 grammes of sugar ; confection of sulphur is made with syrup substitute and orange flower water ; aromatic elixir is made with diluted glucose and the same applies to elixir of orange ; in cod-liver oil emulsion the sugar is merely omitted ; in compound mixture of chloroform syrup substitute is used in place of syrup ; from guaiacum mixture sugar is omitted ; compound powder of almonds contains no sugar ; in compound liquorice powder, maize or rice starch is used in the place of sugar ; there is no sugar in compound powder of tragacanth ; in syrup of hydriodic acid syrup substitute is used, as also in the case of the following syrups : Aromatic, orange, orange flowers, lemon, rhubarb, squill, tolu, urginea, and ginger ; in syrup of senna a variation of syrup substitute is used.

Preparations formerly containing glycerine.—Turning to the preparations containing glycerine, there are several points worthy of note. The following is the formula for glycerine of carbolic acid : —

Phenol	5·0	Chloroform	0·5
Tragacanth	0·7	Distilled water ...	to 100·0

This preparation is less viscous and more readily absorbed than that made with glycerine, and therefore the strength has been diminished. The formula for glycerine of tannic acid is as follows :—

Acid tannic	10·0	Alcohol	2·0
Tragacanth	1·2	Distilled water ...	to 100·0
Chloroform	0·5		

Here again the strength has been diminished on account of the more rapid absorption of the new preparation. Glycerine of alum is made with sugar substitute and the strength has been diminished. The formula for glycerine of starch is as follows :—

Potato starch	5·0	Alcohol	2·0
Tragacanth	0·5	Boric acid lotion B.P.C.	95·0

Glycerine of borax is composed of tragacanth, chloroform, and boric acid lotion. In compound glycerine of glycerophosphates distilled water is used instead of glycerine, and the same device has been adopted in the case of compound glycerine of thymol. In glycerine of pepsin the following is the formula :—

Pepsin	10·00	Distilled water	22·50
Hydrochloric acid ...	1·15	Alcohol (20 per cent.) to	100·00

Glycerine is omitted from the following preparations : Liniment of potassium iodide with soap, compound solution of borax, calamine lotion, quinine lotion, liquor pepticus, sulphur lotion, borax and honey, compound bromide mixture, butyl chloral hydrate mixture, compound pepsin mixture, compound spirit of camphor, tincture of kino, tincture of wild cherry, pepsin wine, iodine ointment, and resorcin ointment. In compound tincture of cardamoms, compound tincture of rhubarb, and compound tincture of senna the glycerine is omitted and a larger proportion of alcohol used.

CENTENARIAN.—Mrs. Sarah Gardiner, who lives at Evelyn Villa, Holly Walk, Leamington Spa, is, a correspondent informs us, 105 years of age.

Correspondence.

"Audi alteram partem."

THE USE OF FLAVINE ANTISEPTICS IN WOUNDS.

To the Editor of THE LANCET.

SIR,—The work on the treatment with acriflavine and proflavine of recently inflicted war wounds, by Captain H. Drummond and Major J. W. McNee, along with Captain L. Colledge, Captain A. F. Sladden, Captain J. E. McCartney, and Lieutenant R. T. Worthington, under the auspices of Surgeon-General Sir Anthony Bowlby constitutes a valuable contribution on the employment of flavine antiseptics under conditions of trial not hitherto recorded. When our original communications were published flavine antiseptics had been extensively tested in this country, but, necessarily, the type of early case investigated by Drummond and McNee was not available here, and while the "prophylactic" use of flavine had been undertaken by one of us [2] in hospital practice, and by Thornton, along with Leeming Walker [3] in the outpatient department, recent injuries of the extent and gravity of those met with in the war zone had not been treated. The results obtained here, however, were of so encouraging a nature as to justify us in the statement that "it is not too much to hope that even in severe cases of injury, with extensive and highly contaminated wounds, the onset of the phenomena of sepsis and anaerobe infection may be aborted to a great extent, provided that energetic treatment is begun at the earliest possible moment." Drummond and McNee have attained a degree of success in this direction by the use of flavine, which, as compared with other methods in present use, seems to leave little to be desired by the most exacting. We are aware that it may be claimed that nothing more has been achieved than was possible by means of the Listerian technique, employing carbolic acid ; but it is notorious that the world of surgery as a whole had not realised the Listerian ideal in preventing septic manifestations in contaminated wounds with a degree of constancy sufficiently high to render the finding of further antiseptics a work of supererogation. The results of Drummond and McNee have, of course, been obtained by radical preliminary surgical treatment, the necessity for which in all cases has been repeatedly emphasised by us when suggesting the use of flavine ; for it is inconceivable that any measure, short of removal, will effectually overcome a focus of infection situated in a mass of necrotic tissue. It is highly satisfactory to note the conclusion arrived at by Drummond and McNee, that "the primary dressing (i.e., gauze packing soaked in 1 : 1000 flavine solution) need not be changed for two or three days and is then easily and painlessly removed." As these observers remark, an important point is that "this may be of great advantage during severe fighting where rapid evacuation of wounded from front to base is required without unnecessary dressing of the wounds." It seems that the simplicity and effectiveness of the procedure must be ascribed to the remarkable property of the flavine antiseptics whereby they continue to act in the serous wound-exudate, thus obviating necessity for the immediate installation of the so-called Carrel's tubes, and the maintenance of what Dakin and his American collaborators [4] have recently characterised as a "complicated hydraulic system." It need scarcely be emphasised that the gain to the comfort of the patient at this serious stage, in addition to the value in medical organisation, is immense, considering that, after the primary dressing, his wound does not require to be disturbed for so considerable an interval. It is most striking that in open wounds treated in the pre-suppurative stage, where the course of events can be observed, on the third day after infliction, when the primary flavine dressing is removed, "all signs of inflammation are wanting and there is no pain, redness, swelling, or induration in the tissues around. The secretion from the wound is

minimal in amount and suppuration is absent." Thus, it appears that a simple flavine packing, subsequent to necessary operative procedure, has enabled the dangerous period of the first few days to be safely passed without the occurrence of gas gangrene or spreading pyogenic invasion of the tissues. As regards the subsequent course of events in such cases, two most interesting observations have been recorded by Drummond and McNee—first, "that in the great majority of the wounds no sterilisation in the bacteriological sense was brought about by the application of flavine. The wounds tended to pass through, as regards their bacterial flora, the stages now well recognised in wounds of this war." In his comment on this point Sir Anthony Bowlby remarks: "In spite of the presence of bacteria, there is a notable absence of inflammation and of septic infections"; and it is most important to notice that not merely are the local phenomena absent, but also the severe constitutional evidences of septic infection are awanting. Thus, it is not merely a question of flavine having masked the action of the organisms in the wound, but, judging from the results, *the organisms have actually been deprived of their virulence and pathogenic properties by the presence of flavine.* As Drummond and McNee remark, there exists "the fundamental difference between what may be termed 'surgically sterile' as distinct from 'bacteriologically sterile' wounds. Complete bacteriological sterility was rarely obtained, yet the patients were obviously doing well, and the wounds showed no signs of local or spreading inflammation. In several instances secondary suture was adopted with complete success, while numbers of organisms were still recognisable in the field of the microscope. Cultures, moreover, showed that these organisms were still viable." It seems to us that this quotation illustrates the valuable results likely to be obtained from the balanced collaboration of the clinic and the laboratory. Implicit reliance on precedent would here have led to erroneous conclusions as to the suitability of such wounds for suture, and it is likely that they would have been condemned on the basis of "bacterial charts." As we had previously remarked,[5] "there is no proof that the standards established in connexion with hypochlorite solutions will apply precisely to wounds treated with other antiseptics. Information on this point in connexion with flavine compounds and other substances must be interpreted without bias derived from a knowledge of the significance of the findings under the particular conditions studied by Carrel." Major Carslaw's[6] conclusion, in an independent series of cases, is in complete agreement with Drummond and McNee on this question of the lack of significance attaching to the exclusively bacteriological criterion of progress in the wounds. As regards the existence of certain types of *B. coli* which are relatively resistant to flavine, we have been able to verify this fact; but it must be noted that all coliform types do not present this resistance, and the common *B. coli* is not highly resistant. The second point is that open wounds under continuous treatment with flavine from the presuppurative stage onward, "tend to assume a stagnant condition, during which the processes of repair are almost in abeyance." We have, of course, never had an opportunity of following large open wounds treated in this manner from the earliest stage and we accept without reserve these highly important observations of Drummond and McNee. An examination of their histological data shows that when flavine solution is applied to *freshly exposed* tissues there is very little in the nature of a reparative tissue-reaction; the surface of the wound becomes covered with a fibrinous membrane and the condition remains practically *in statu quo:* at the same time, it must be again emphasised that, in spite of this, the net result of the flavine treatment is to prevent any tendency to the development of the phenomena of local or general infection. The "narrow zone" of necrosed muscle fibre in the floor of the wound can scarcely be attributed to a deleterious action of flavine on the tissues, since the same appearance is met with in a recent "aseptic" operative surgical incision closed by sutures, nor do Drummond and McNee attribute the microscopic necrosis to the flavine. Their histological picture seems to be a most satisfactory confirmation of our original statement as to the harmlessness of flavine when applied to the vegetative tissues. As to the inhibition of reparative reaction, we have never had the chance of making observations under the conditions now investigated, but we heartily endorse the conclusion that, in these circumstances, "it is obviously improper treatment to continue the application of flavine until such a stage is reached." As regards later treatment in those cases where suture is impracticable, as in large superficial wounds, we would suggest that the possibilities of effective intervention are not exhausted by the application of eusol, which, however, owing to the solvent action of hypochlorites, affords a useful means of removing the fibrinous membrane. The use of brilliant green at this stage would be most interesting; observations have suggested that it causes exuberant growth of well-vascularised granulation tissue and that the effect can be regulated according to the concentration employed; this would be a most valuable condition for further trial.

A further point to which we would especially draw attention is the misinterpretation which is likely to be attached to Drummond and McNee's conclusion that "flavine cannot be classed as a success in the treatment of the *later* stages of war wounds"; this unqualified statement, apart from the context, is liable to cause grave misunderstanding. It is obvious that *the authors are here referring solely to their experience with cases treated continuously from the presuppurative stage onward with flavine.* The majority of wounds which reach this country have not been so treated, and it is probably the rule for war wounds as they reach home hospitals to be in a state of suppuration. Now the majority of the original tests were made in such suppurating cases, and the opinion regarding the highly beneficial action of flavine as a therapeutic antiseptic was arrived at by one of us (Ligat) owing to observations under such conditions. In contrast to Drummond and McNee's observations on cases treated *ab initio* with flavine, it is noteworthy that where flavine treatment was *begun in the later stages* the formation of pink healthy granulation tissue and the ingrowth of epithelium appeared much accelerated—a point which is confirmed by Carslaw's[6] observations on wounds treated with flavine after the onset of suppuration. This happened concomitantly with the diminution of suppuration, which had often persisted for long periods in spite of other accepted forms of treatment—brilliant green led to similar results, although it appeared not quite so effective when applied in similar fashion. Carslaw has also drawn attention to the effect of flavine in putting an end to suppuration in cases which had long failed to respond to a variety of therapeutic agencies.

With regard to the question of mode of application, it is to be noted that intimate contact of the antiseptic with the tissues must be secured; no known antiseptic will act at a distance, and also the antiseptic present must be available; hence gauze soaking with flavine solution should be used for packing. The latter caution has been added because it has come to our notice that some surgeons have considered that they were applying flavine treatment when they introduced into the wound gauze wrung as tightly as possible from the solution; no doubt this was a beneficial procedure in the case of the harmful, older antiseptics, but it is not an effective method of applying flavine! We would also draw attention to the method of efficient application by a tube with valved outlet devised by Mr. T. H. Kellock.[7] This matter of the necessity for intimate contact of the antiseptic with the infected tissue cannot be over-emphasised; contact is comparatively easily attained in the case of open surfaces and is difficult to secure in deep wounds—e.g., compound fractures, and in consequence of this beneficial effects may appear less marked in such cases. It would be ignorance or disregard of the significance of this point, however, which would prompt a statement to the effect that a substance acted well on surface wounds, but was incapable of acting in deep ones; this would mean nothing more than that the mechanical procedures were defective in securing contact in the depths.

The observations as to the promotion of healing brought about by flavine in suppurating wounds, in which granulation tissue is already present, have been confirmed by Carslaw[6] and others and do not stand in any contradiction to those of Drummond and McNee. Obviously the formation of granulations from the vegetative tissues is one process and the active proliferation of granulation tissue which has once

[5] Browning, Gulbransen, and Thornton: Brit. Med. Jour., July 21st, 1917.

[6] Carslaw: R.A.M.C. Jour., vol. xix., p. 488, 1917.

[7] Kellock: THE LANCET, 1917, ii., p. 348.

been formed is another; as to epithelial ingrowth, it is notably influenced by the relationships of the granulation tissue. As regards the formation of the pellicle in wounds coming under flavine treatment when already in the suppurating stage, some observers appear to be more familiar with this phenomenon than others and the differences in method of use which determine varying results require further elucidation.

So far as our own observations are concerned and in the light of Drummond and McNee's and Carslaw's work, the importance of which rests both on the valuable therapeutic results obtained and also on the evidence of scientific attitude in seeking an appropriate clinical application for laboratory results, we feel that what we had anticipated for flavine antiseptics, and perhaps even more, is likely to be realised. It has not been suggested that from start to finish of any infected wound flavine ought to be applied continuously, and Drummond and McNee's work on wounds in the presuppurative stage, as well as Carslaw's observations on those already suppurating, afford a clear proof of the suggestion which we made, that the most valuable effects of flavine antiseptics are to be obtained in the first few days of application, and that later on, after serious infective processes have been prevented or overcome, it is advisable to intermit their use or to substitute some other compound—thus, to prevent the appearance of sepsis and to control it when established are results which flavine antiseptics undoubtedly have shown themselves capable of accomplishing, with a very great measure of success, by comparatively simple procedures. Now that these important general points have been demonstrated by several independent series of observers, and that the broad lines of suitable application have been established, the way seems clear for further detailed work, which will also lead to the elaboration of methods for advantageously utilising the properties of these substances in other departments of surgery.

In conclusion, it may be added that in view of the preference shown by many surgeons for the use of antiseptics in the form of oily pastes, a procedure the rationale of which—apart perhaps from its "depôt" effect and its use in long narrow sinuses—is probably not yet fully understood, we hope that proflavine will soon be available in this form, e.g., as a fatty acid compound (oleate, &c.) which will be dissolved in oils and paraffins, or homogeneously mixed with these substances.

We are, Sir, yours faithfully,

C. H. BROWNING.

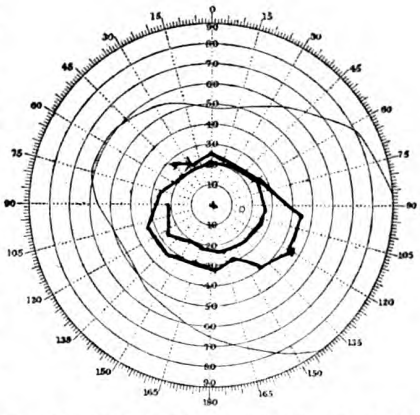
The Middlesex Hospital, Nov. 6th, 1917.

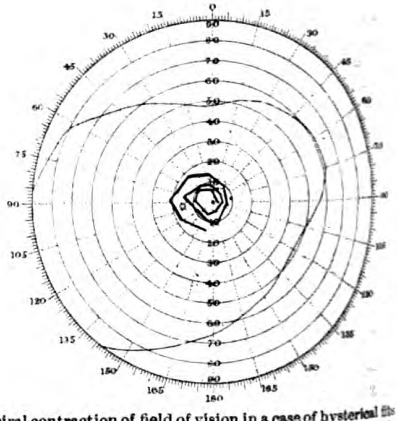
SPIRAL FIELDS OF VISION IN HYSTERIA, MALINGERING, AND NEURASTHENIA.



To the Editor of THE LANCET.

SIR,—In your issue of Oct. 20th Mr. W. M. Beaumont upholds the opinion expressed in Jones and Llewellyn's "Malingering, or the Simulation of Disease," that spiral fields of vision are characteristic of neurasthenia, in opposition to the view usually taught and quoted in your review of their book (THE LANCET, August 4th) that spiral fields are characteristic of hysteria. I am convinced that neither view is strictly accurate, as both narrow and spiral fields of vision are invariably the result of unconscious suggestion on the part of the observer. They are often produced in patients with hysterical symptoms, because, as Mr. Beaumont points out, such patients are generally abnormally suggestible, and they may be produced in neurasthenic patients, because they are abnormally easily fatigued and often abnormally suggestible in consequence, thus explaining the frequent association of hysterical symptoms with neurasthenia. Conclusive evidence of this view is brought forward by Morax, a distinguished French ophthalmologist, and formerly an assistant of Charcot, who was the first to describe these so-called ocular stigmata of hysteria. A true disciple of his great master, he continued for several years to find a narrow or spiral field of vision in all the hysterical cases he saw. But over 20 years ago he became a convert to Babinski's view that all the so-called hysterical stigmata are due to suggestion by the observer, and from that day he has not seen a single case of a narrowed or spiral field of vision. Babinski, who, as chef de clinique, had watched the development of Charcot's views on hysteria, soon felt himself forced to reject them, as he never found the so-called stigmata in any of a series of 100 consecutive cases of hysteria, which he examined in great detail by methods which excluded the possibility of suggestion. Morax adopted new methods to replace the perimeter, which it is practically impossible to use without at the same time suggesting a narrow field of vision, although, of course, the suggestion only takes effect in abnormally suggestible individuals.

In a small way my own experience has been identical with that of Babinski and Morax. I was in charge of the Neurological Department at Guy's Hospital for a year before I visited Babinski's clinique at La Pitié, and a week rarely passed in which I did not demonstrate one or more hysterical cases in which I had found hemi-anæsthesia and a narrow or spiral field of vision. In the nine years which have passed since then I have seen hysterical hemi-anæsthesia only once and I have never seen a narrow or spiral field of vision in a patient in whom these symptoms had not been looked for before he came to me, and my experience has not altered during the past 15 months, in which I have had several hundred soldiers with hysterical symptoms under my care.



I recently examined 17 healthy medical students who had not yet been in the wards or read any medicine, after asking them to pretend to the best of their ability that they were paralysed in the right arm and leg. On being pressed whether they complained of anything besides paralysis not one mentioned any disturbance of vision, but in answer to a leading question four said they saw less well in the right eye than in the left. Each of the four stated that it was a general deficiency of vision, and said nothing to indicate that he meant a narrow field of vision. Their fields were then examined by the apparently rough finger method, which has, however, the great advantage of suggesting nothing, and no abnormality was found. They were then examined with the perimeter in the ordinary way: in each case a typical narrow field of vision was found in the right eye and in one case in the left, but to a much less degree. In the only two cases in which it occurred to

FIG. 1.

Spiral contraction of field of vision in a case of admitted malingering.

FIG. 2.

Spiral contraction of field of vision in a case of hysterical film without visual symptoms, in which the finger method used before the perimeter, showed a normal field.

me to continue the investigation after the first field had been marked out a spiral was obtained (Fig. 1) which was identical with that supposed to be characteristic of hysteria (Fig. 2). I expect that the reason why a spiral field of vision, which is the natural result of continued suggestion, has not been found in a larger proportion of hysterical cases showing a narrow field of vision is simply because it has not been looked for, the examiner being content when he has marked the limit of vision a single time in each direction.

Captain J. L. M. Symns and I have found in several cases of hysteria that an outward spiral was always obtained instead of an inward one if the white disc of the perimeter was moved outwards instead of inwards, as is commonly done. This proves conclusively that the ordinary inward spiral is the result of suggestion and not of fatigue.

In malingering some symptoms are produced voluntarily by the individual on his own initiative and others are produced voluntarily after being prompted by suggestions made unconsciously by the observer. The same two processes occur in hysteria, with the difference that they are involuntary, the symptoms being produced subconsciously, some by auto-suggestion and others by suggestions made by the observer. It is thus quite impossible to diagnose hysteria from malingering by a study of the symptoms alone.

I am, Sir, yours faithfully,

Netley, Oct. 21st, 1917. ARTHUR F. HURST.

THE FUTURE OF THE POOR-LAW.

To the Editor of THE LANCET.

SIR,—It is time for those who wish to continue as Poor-law medical officers to wake up. There is a proposition which many are wanting to see acted on—viz., that the Poor-law service should become part of, and merged into, the present and future general insurance scheme. The majority (about 2 to 1) of the members of the Poor-law Medical Officers' Association do disapprove of any alteration. It would help if all Poor-law medical officers would send me each their opinion and wish in as few decisive words as possible. I could then tabulate them and find the wish of the majority and make the conclusion known in THE LANCET and *British Medical Journal*.

There is a promise of compensation for vested interests if lost by change of Act of Parliament, but the compensation is never equal to the office and money lost. It may be a compensation, but not an absolute *quid pro quo*. It is not right that those who have no personal interests should decide for those whose actual living and other details of work centre round a Poor-law appointment. It is easy to look down from a higher perch and wish to brush special departmental appointments into the general hubbub. This is just what a State service commandant would like to do. I say again that the future of the Poor-law will be influenced by the amount of resistance offered by its medical and civil officers.

I am, Sir, yours faithfully,

A. WITHERS GREEN,
Honorary Secretary, Poor-law Medical Officers' Association.

Wardrobe-place, E.C. 4, Nov. 2nd, 1917.

INSANE SAILORS AND SOLDIERS.

To the Editor of THE LANCET.

SIR,—Dr. J. F. Gemmel writes with feeling on this subject in your issue of Oct. 20th. I myself have an intense admiration and deep sympathy for our insane sailors and soldiers. So much so that when the Board of Control circularised asylum committees I advised our committee to suggest just such a project as Dr. Gemmel's. The Board of Control replied that such a project was not feasible for two reasons (if I remember correctly). The first was that the mental invalids would be out of reach of their friends, and the second that the numbers affected would be too great. I have always found the Board deeply interested in the welfare of the insane.

The points for consideration seem to me to be as follows:—1. To erect an asylum for these so-called "service patients" is to erect a monument to them. The public would call it the "soldiers' asylum." The stigma would remain and be magnified. The same result would follow if we kept an already-erected asylum for them. 2. Removal from War Office influence, from all reminders of war, would be beneficial. This can be better done as the Board of Control suggests. 3. Documentary evidence, or the want of it, will not make these patients either more or less insane. And certification is protection. Certified patients are protected by the Board of Control. 4. From the point of view of the patients' friends the patients are best in the nearest asylum to them (and this can always be arranged under existing circumstances), and in the nearest cemetery after death. 5. Amongst my cases those patients in whom sufficient intelligence remains have preferred to go near their friends. 6. The term pauper is a misnomer. Many, I should say the majority of patients, in so-called "pauper asylums" are not paupers. Furthermore, most of them come from the same class as the majority of our sailors and soldiers. These will not feel their position as patients but merely as *insane* patients. 7. The allowance of 3*s*. 9*d*. above the maintenance rate is not all: 2*s*. 6*d*. is allowed for extra comforts and should be made use of. Perhaps even this is not enough, but no doubt time will tell and more may be granted.

I consider that *every* patient who has been in the Army or Navy honestly should be classed as a "Service patient." They did their best and broke down. All honour to them! Much can be done for them. Where there are many special wards can be allocated to them. Special privileges can be granted to them. Special kindness can be shown to them. If the letter of my old colleague Dr. Gemmel encourages other superintendents to do their very best for insane sailors and soldiers it will not have been written in vain.

I am, Sir, yours faithfully,

W. J. A. ERSKINE.

County Asylum, Newport, I.W., Nov. 2nd, 1917.

THE VESTIBULAR TESTS AND FUNCTIONAL DEAFNESS.

To the Editor of THE LANCET.

SIR,—I think that if Dr. P. McBride were to carry out the vestibular tests regularly in cases of perceptive deafness their scepticism as to their general usefulness as aids in the diagnosis of functional deafness might become modified. It is now about five years since I first drew attention to the interesting and still unexplained fact that the vestibular sense-organ seems to become impaired in harmony with the degree of severity of the cochlear disease in cases showing perceptive deafness due to organic disease. This phenomenon appears, as Dr. McBride says, even in cases of noise-deafness. On the other hand, I have shown, and I believe that the observation has been generally confirmed, that in functional nerve-deafness, whether due to hysteria or neurasthenia, the vestibular reactions are as lively as, or even more lively than, the normal.

To these broad general statements there are, no doubt, exceptions to be made, and if any of your correspondents are interested in the subject I refer them to the Proceedings of the Otological Section of the Royal Society of Medicine, and more particularly to the discussion on nystagmus (jointly with the Ophthalmological and Neurological Sections), where I had an opportunity of expressing views on the subject which subsequent experience has not materially modified.

I am, Sir, yours faithfully,

Nov. 6th, 1917. DAN MCKENZIE.

References.—Proceeds. Roy. Soc. Med., Otolog. Sect., vol. iii., p. 74, vol. v., p. 18; and Joint Discussion on Nystagmus, Feb. 26th, 1914.

THE SOURCE OF SPIROCHÆTES IN URINE.

To the Editor of THE LANCET.

SIR,—As one among others who have recently been engaged with the investigation of trench fever, I wish to make one or two criticisms of the paper by Captain A. T. Nankivell and Captain C. E. Sundell in your columns, containing their observations of spirochætes in the urine in cases of this disease. In the first place I should like to ask them whether in any of their cases they have ever found spirochætes of the type which they describe in a specimen of urine collected by catheter. Again I notice that in only one of their positive cases was the smegma examined for spirochætes, none being found. I have not seen, nor have I met anyone who has seen, this type of spirochæte in a catheter specimen of urine. On the other hand, in a case of my own—a recruit who

had never been in France before and was admitted to hospital with bronchitis a week after landing in this country, whose urine was examined as a control—numerous spirochætes were found in a specimen collected in the ordinary way after cleansing the glans penis with antiseptic lotion, no other organisms being found on the slide. In a catheter specimen taken at the same time careful search revealed no spirochætes, but in smears made from the prepuce and meatus urethræ many spirochætes of the type under discussion were seen, together with other organisms.

If Captain Nankivell and Captain Sundell are continuing their researches, surely it would be justifiable for them to catheterise a series of "positive" cases, as by this means only can they establish their assumption that the spirochætes they have found are present in the bladder and are not due to accidental contamination.

I am, Sir, yours faithfully,

C. P. SYMONDS, M.R.C.P. Lond.,
Temporary Captain, R.A.M.C.

Nov. 7th, 1917.

TRAUMATIC RUPTURE OF THE HEART.

To the Editor of THE LANCET.

SIR,—In your issue of Oct. 13th is published a case of traumatic rupture of the heart, and as this injury does not appear to be of great frequency perhaps I might be allowed to mention the following case. At the end of last year I was called upon to perform a post-mortem examination of a man who had been knocked down by a taxi. There were several abrasions on the front of the chest, but no wounds. On the left side the third, fourth, fifth, sixth, and seventh ribs were fractured, about 5 inches from the sternum. The pericardium was torn at the apex and was filled with blood. There was a tear in the apex of the left ventricle, perforating the entire thickness of the heart wall and had evidently been caused by the broken end of one of the fractured ribs penetrating the pericardium and myocardium.

I am, Sir, yours faithfully,

J. F. O'GRADY,
Senior House Surgeon, Ancoats Hospital, Manchester.

Oct. 31st, 1917.

DIATHERMY.

To the Editor of THE LANCET.

SIR,—My attention has been called to Dr. W. J. Turrell's letter regarding my note on diathermy in THE LANCET of Oct. 20th, and I much regret that by an oversight I did not refer to Dr. Turrell's valuable paper on the subject read before the Royal Society of Medicine and published in the Proceedings of the society in March, 1916. The great value of this paper is generally appreciated by all interested in electro-therapeutics, and his later work has extended to a considerable degree the field of usefulness of this method of employing diathermy. I hope Dr. Turrell will accept my apologies for this omission, which I can assure him was not intentional.

I am, Sir, yours faithfully,

Harley-street, W., Nov. 8th, 1917. L. W. BATHURST.

THE Grainger testimonial prize of 30 guineas at St. Thomas's Hospital, which is given for a series of specimens illustrative of recent anatomical and physiological research, has been awarded to Mr. R. S. Foss.

LITERARY INTELLIGENCE.—Messrs. Williams and Norgate have in the press a work by Dr. Mary Scharlieb, entitled "How to Enlighten Our Children: a Book for Parents," which deals in simple fashion with the problem of what should be said by parents to their children with regard to sex. The same firm announces in "The Making of the Future" Series, a volume by Professor H. J. Fleure, entitled "Human Geography in Western Europe," and concerned with race distribution and the influence of climate and environment in the evolution of man.

POOR-LAW GUARDIANS IN IRELAND.—Friction continues in Ireland owing to the refusal of the Local Government Board of Ireland to sanction the appointment of any medical officer of military age to Poor-law unions while Ireland is exempt from conscription. The low salary of the Poor-law doctors has led to the actual or threatened resignations of these officers, as the result of the refusal of their boards of guardians to give them adequate salaries, and the Irish Medical Committee has called upon the Local Government Board to remedy the position.

The War.

THE CASUALTY LIST.

THE following names of medical officers appear among the casualties announced since our last issue:—

Killed.

Lieut.-Col. C. R. A. Pye, D.S.O., Australian Infantry, was educated at Sydney University Medical School, and qualified. He afterwards studied in England and returned to Australia on the outbreak of war, and elected to remain a combatant officer, having previously attained to the rank of Captain in the Australian Infantry. He was awarded the D.S.O. in May this year for conspicuous gallantry and initiative when in charge of the whole of the front line held by his battalion.

Capt. J. B. Randall, R.A.M.C., attached Royal Field Artillery, received his medical education at St. Bartholomew's Hospital, London, and qualified in 1914. He held an appointment at St. George's Hospital, London.

Capt. R. A. Ireland, Canadian A.M.C.

Died of Wounds.

Capt. G. E. Chissell, R.A.M.C., was a student at Middlesex Hospital, and qualified in 1916, joining up shortly afterwards.

Died.

Lieut.-Col. W. Graham, R.A.M.C., was educated at Belfast, London, and Paris, and qualified in 1882. At the time of his death, the result of an accident, he was in charge of the Belfast War Hospital, and was Medical Superintendent of the Purdysburn Asylum, Belfast. He was the author of several articles on lunacy and allied subjects in medical literature.

Capt. H. L. Heslop, R.A.M.C., attached Durham Light Infantry, qualified at Durham in 1903. He held appointments at the Children's Hospital, Sunderland, and at the Tynemouth Jubilee Infirmary, and was in practice at Sunderland previously to joining the R.A.M.C.

Previously reported Wounded, now reported Died of Wounds.

Capt. K. A. MacCuish, Canadian A.M.C.

Wounded.

Capt. M. A. Power, R.A.M.C.
Lieut. D. W. Anderson, R.A.M.C., attached Norfolk Regt.
Capt. A. E. Huxtable, R.A.M.C.
Capt. W. B. Jepson, R.A.M.C., attached Devon Regt.
Capt. D. MacNair, R.A.M.C., attached Sherwood Foresters.
Lieut. W. H. Orton, R.A.M.C.
Capt. J. Gaff, R.A.M.C.
Lieut. J. A. C. Greene, M.C., R.A.M.C., attd. West Yorks Regt.
Capt. J. Morris, M.C., R.A.M.C., attached Cheshire Regt.
Capt. K. H. Stokes, R.A.M.C., attached Black Watch.
Surg. J. J. Keatley, R.N.
Capt. T. J. Kelly, R.A.M.C.
Capt. C. Wynne, R.A.M.C., attached Royal Field Artillery.
Capt. H. S. Moore, R.A.M.C.
Major N. E. Kirkwood, M.C., Australian A.M.C.
Major J. R. Muirhead, Australian A.M.C.
Capt. J. H. Fletcher, D.S.O., M.C., R.A.M.C.
Capt. J. Dunbar, R.A.M.C.
Capt. J. M. Forsyth, M.C., R.A.M.C., attached Cheshire Regt.
Capt. F. P. Jocelyne, M.C., R.A.M.C.
Capt. M. P. Power, R.A.M.C., attached Devon Regiment.
Capt. A. J. Howard, Australian A.M.C.
Capt. I. Morgan, Australian A.M.C.
Capt. J. P. Peake, Canadian A.M.C.

CASUALTIES AMONG THE SONS OF MEDICAL MEN.

The following additional casualties among the sons of medical men are reported:—

Second Lieut. A. McK. McRae, Royal Engineers, killed in action, youngest son of Dr. D. McRae, of London, E.

Second Lieut. I. V. Douglas, M.C., Royal Garrison Artillery, killed in action, youngest son of Dr. T. Douglas, late of Hill House, Sapperton.

Capt. J. B. Randall, R.A.M.C., killed in action, younger son of Mr. W. Randall, M.R.C.S., of Bridgend, Glam.

Lieut. F. C. C. Devlin, West African Frontier Force, killed in action, youngest son of Capt. T. P. Devlin, R.A.M., of British Columbia.

Lieut. J. E. Almon, Canadian Infantry, killed in action, younger son of the late Dr. T. R. Almon, of Halifax, Canada.

Second Lieut. T. B. M. Streatfeild, Royal West Kent Regiment, killed in action, only son of Dr. T. Streatfeild, of Folkestone.

Capt. G. M. Finlay, Hampshire Regiment, late Leinster Regiment, killed in action, youngest son of Colonel A. Finlay, late R.A.M.C.

OBITUARY OF THE WAR.

ALEXANDER WARD FORTESCUE SAYRES, M.D. BRUX., D.P.H.,

LIEUTENANT-COLONEL, ROYAL ARMY MEDICAL CORPS.

Lieutenant-Colonel A. W. F. Sayres, who died of wounds Oct. 10th, was the youngest and only surviving son of the e Rev. Edward Sayres, rector of Cold Ashton, Gloucestershire. He was educated at Sherborne and studied medicine at St. Thomas's Hospital, qualifying in 1890, and holding thereafter several house appointments. After periods of private practice at Wincanton, Woodford (Essex), and Exeter he was appointed in 1913 tuberculosis officer to the Stonehouse district of Devon. Since November, 1914, he had served in France, where he was in command of a Wessex Field Ambulance. On July 17th last he was severely wounded, losing his

t leg and hand besides other injuries, to which he umbed three months later. A superior officer writes of : "His influence lives in the good work done by the ers and men of his ambulance, whom he trained with zeal and energy." Colonel Sayres married in 1894 the nd daughter of P. M. Muntz and leaves a widow and e children.

NOEL HUMPHREY WYKEHAM SAW, M.R.C.S. ENG.,

MILITARY CROSS,

CAPTAIN, ROYAL ARMY MEDICAL CORPS.

aptain N. H. W. Saw, who was killed in action on 9th at the age of 25, was younger son of Samuel Saw, or, of Blackheath. He was educated at Stratheden se School, Blackheath, and Cheltenham College, where ntered the O.T.C. He took his medical course at Guy's pital, where he was for four years a member of the Artists' Rifles. On the outbreak of war he applied to rejoin the Artists, but was advised to complete his medical course in October if possible, qualifying in February, 1915, and at once joining the R.A.M.C. (Special Reserve). In the following July he was sent to Mudros, and, becoming attached to the Worcestershire Regiment, went to the Gallipoli Peninsula, taking part in the evacuations at Suvla Bay and Cape Helles. After some months in

t and at Suez, he was present at the Battle he Somme, where last July he was awarded the ary Cross. He met his death whilst tending the ded, a shell landing in the doorway of the aid-post e he was working and killing him instantly. A fellow , who long shared the same dangers and vicissi- , writes of Captain Saw's cheery disposition and ish behaviour. At college he had some reputa- as an athlete, playing football for his hospital and heath.

WILFRID THOMAS CHANING-PEARCE, B.A., M.B., B.C. CAMB.,

MILITARY CROSS,

CAPTAIN, ROYAL ARMY MEDICAL CORPS.

Captain W. T. Chaning-Pearce, who was killed on Oct. 1st in action at the age of 32 years, was third son of Dr. J. Chaning-Pearce, of Ramsgate. Educated at Lindenthorpe, Broadstairs, Rugby School, and Emmanuel College, Cambridge, he completed his medical study at Guy's Hospital, qualifying in 1911, after which he held various house appointments at Guy's Hospital and elsewhere. In October, 1914, he obtained a commission in the Royal Army Medical Corps, and saw much active service in France, latterly with the King's Liverpool Regiment. In September last he gained the Military Cross for gallantry and devotion to duty. In charge of the regimental aid-post, he moved it forward, on his own initiative, through a severe enemy barrage into a newly captured position, and there attended to wounded from 16 different battalions. He met his death at the hands of a German sentry, being shot through the chest. Letters from fellow officers speak of his unfailing cheerfulness and contempt of danger. Captain Chaning-Pearce was unmarried.

DUBLIN GENERAL HOSPITAL, BOULOGNE.

The third contingent of physicians and surgeons from Dublin has arrived in France and taken up work in the Dublin General Hospital. Amongst their number are the following: Lieutenant-Colonel William Taylor, Lieutenant-Colonel H. C. Drury, Major J. Lumsden, Major C. M Benson, Major S. H. Law, and Captain J. W. Killen.

SIR VICTOR HORSLEY'S GRAVE.

We are indebted to Messrs. Parke, Davis and Company for the accompanying photograph of Sir Victor Horsley's grave at Amara, taken by Sergeant E. Welton, R.A.M.C., attached to an Indian General Hospital. The grave is in the British Cemetery, which lies on the fringe of a palm grove, the mound consisting of earth baked and cracked in the sun.

RED CROSS FUNDS.—The Joint Finance Committee of the British Red Cross Society and the Order of St. John has received £10,000 from the Natal "Our Day" Fund collection. The contribution for "Our Day" in East Africa is £9000.

THE TREATMENT OF DISCHARGED DISABLED SAILORS AND SOLDIERS IN CIVIL HOSPITALS.

The following correspondence has taken place between the London War Pensions Committee and St. George's Hospital, and within the scope of two short letters exposes a very important position.

ENCLOSURES.

London War Pensions Committee,
43, Bloomsbury-square, W.C. 1,
18th October, 1917.

SIR,—As you are perhaps aware, the Ministry of Pensions have recently issued instructions empowering Local War Pensions Committees to enter into arrangements with civil hospitals for the treatment of discharged disabled sailors and soldiers. The scale of payment which Local Committees are authorised to make to hospitals which agree to treat discharged men is as follows:—

In-patient treatment: Not exceeding the minimum charge made in the case of ordinary patients, provided that the charge does not exceed in any case 28*s.* a week.

Out-patient treatment: Not exceeding 1*s.* for the first and 6*d.* for each subsequent attendance of the patient unless the treatment consists of, or includes, massage, electrical, X ray, or other special form of treatment, in which case the fee shall not exceed 2*s.* 6*d.* for the first visit and 1*s.* 6*d.* for each subsequent visit, to include all services.

Generally speaking, cases of wounds and injuries are sent for treatment to military hospitals, and it will be largely cases not included in these categories which would be sent to the civil hospitals. It is not possible to state precisely what number of men will be sent for treatment, but if the war continues the number will, no doubt, steadily increase.

One of the conditions upon which a local committee can enter into arrangements with a hospital is that the hospital authorities shall notify the Local Committee, in the case of in-patient treatment, of the date of admission or departure of the men as soon as either event occurs; and, in the case of out-patient treatment, immediately upon the commencement and termination of the treatment. Occasional reports will also be required in certain cases as to the men's progress.

I am directed to inquire whether the authorities of your hospital would be prepared to enter into an arrangement with the London War Pensions Committee of the nature indicated, and, if so, what would be the charge for (*a*) in-patient treatment, and (*b*) out-patient treatment. I am, Sir, your obedient servant,

(Signed) ETHEL V. W. WOOD,
Secretary.

The Secretary of the St. George's Hospital.

St. George's Hospital, S.W. 1.
Nov. 8th, 1917.

MADAM,—The House Committee of this hospital have had your letter of Oct. 18th, 1917, under serious consideration, and, as at present advised, see great difficulties in the way of their acceding to the proposals contained in it.

This hospital is a charitable institution established "for the relief of such poor, sick, and disabled persons as should appear real objects of charity," and is supported (on that basis) by voluntary subscriptions. The Committee fail to see that pensioners for whom the State has assumed responsibility come within even the widest interpretation of the trust which they have to administer.

Furthermore, it is likely that the condition of many of the pensioners sent for admission will be such that they would ordinarily be treated as out-patients, and the House Committee think it a matter of great importance that the beds of this hospital should be reserved for urgent cases that require the services of the highly skilled staff provided by the hospital and not be used by patients for whom it is wished to provide a temporary home.

Again, the question as to whether an honorary staff can be required to treat gratuitously patients for whom the State makes itself responsible is one still under discussion and has not been settled by the medical profession.

Even if the questions of principle mentioned above could be surmounted, the rate of payment proposed would not nearly cover the cost for provisions, drugs, &c., of a patient, without making any allowance for professional attendance, and it seems to my Committee quite wrong that the excess should fall on voluntary contributions.

While they do not see their way at present to enter into any such arrangements as you indicate, I am directed to remind you that the doors of this hospital are always open to suitable cases amongst pensioners in their position of sick and poor members of the community, both as out- and in-patients and without payment.

Yours faithfully,
(Signed) JAS. M. CHURCHFIELD,
Secretary.

The Secretary,
London War Pensions Committee.

The secretary to the London War Pensions Committee in making the offer to St. George's Hospital, as empowered by the Ministry of Pensions, asks for the charges per week per head that would be made for the reception of in-patients and out-patients respectively. In so doing mention is made of the limits to which charges can be met and of the class of cases that would be sent, but no allusion occurs to remuneration for medical services. The secretary of the hospital indicates that the hospital cannot, without defaulting from duty, admit pensioners of the State to an institution founded, and voluntarily supported by the public, in the interests of objects of charity, while the sums of money offered are, he adds, inadequate. The arguments here are so potent that the further reasons given for looking unfavourably upon the proposals of the London War Pensions Committee seem slight in comparison with them, but they are really of considerable significance. First, the in-patients of such a hospital as St. George's Hospital ought not to be of the class indicated by the London War Pensions Committee, the beds being required for urgent and difficult cases which can only be treated in a general hospital with full equipment. Secondly, it is doubtful whether the services of an honorary staff should be diverted from the sick poor to the benefit of State pensioners. Many of the discharged sailors and soldiers could be, and should be, treated by the general body of the medical profession at fees on a reasonable scale; the staffs of the civilian hospitals form the consultants in such cases, and reference could be had to them in all matters of doubt, with the result that the properly serious conditions should at once receive admission to, and treatment at, an institution.

MEDICAL RE-EXAMINATION OF MEN FOR THE ARMY

The rules for the guidance of Medical Assessors in connexion with the medical re-examination of men for the Army announced in our last week's issue, are set forth as follows in pamphlet R. 156, issued by the Local Government Board. Subject to the provisions contained in these rules, it becomes the duty of the Medical Assessors to examine medically and to grade any man who is referred to them in accordance with the rules, who attends for the purpose. The man shall be graded only after his case has been considered by at least three Medical Assessors, and after consultation between them.

At least three clear days before the date fixed for the re-examination of the man, the Medical Assessors shall send to him notice in writing of the date, time, and place fixed for the re-examination.

In the grading of a man the Medical Assessors shall proceed in accordance with the general instructions issued by the Minister of National Service to National Service Medical Boards, except in so far as is provided otherwise in these rules.

Before a man is examined by the Medical Assessors—(*a*) They shall have before them the man's medical history sheet prepared by the National Service Medical Board and the form of application—with the accompanying papers—sent to the Tribunal, or a copy of the form and papers, unless for good reason shown any of these documents cannot be obtained; and (*b*) the man shall be required to produce and surrender to the Medical Assessors the grade card issued to him after his examination by the National Service Medical Board. If in any case a man is graded by the Medical Assessors without the production of any of the above-mentioned documents, the fact and the reason shall be stated in their record of the man's grading and in their report to the Tribunal.

Before coming to a decision as to the grading of a man the Medical Assessors (if they consider this course necessary and if provision has been made in that behalf with the approval of the Local Government Board) may refer him for special examination, or may refer any question arising in connexion with the case, to a medical practitioner or institution, or may arrange for his temporary reception into an institution for special observation. If a man refuses to undergo the special examination or special observation, the Medical Assessors shall grade him on the facts available after his examination by them, in accordance with these rules; and shall also state the fact of his refusal in their record of his grading and in their report to the Tribunal.

When the Medical Assessors have come to a decision as to a man's grading they shall (*a*) record their finding in the prescribed manner; (*b*) cancel the grade card surrendered by the man, and the counterfoil of that grade card; (*c*) issue forthwith to the man a grade card in the prescribed form; (*d*) forward to the Assistant Director of Recruiting for the area the man's medical history sheet, with their finding recorded in the prescribed manner, the counterfoil of the man's new grade card which shall be attached to the medical history sheet, and the cancelled grade card and counterfoil; (*e*) return the form of application with the accompanying papers to the Appeal Tribunal, with their report as to the man's grading.

The Medical Assessors shall keep such records and furnish such reports as may be required by the Local Government Board.

The Medical Assessors may in any individual case recommend to the Local Government Board that a question of principle involved in the grading of the man be considered by the Advisory Medical Board, or such medical practitioners as may be deputed by the Advisory Medical Board for the purpose.

If the Local Government Board refer any such question to the Advisory Medical Board, the grading of the man shall be in accordance with the decision of the Advisory Board.

A further pamphlet (R. 157) contains detailed notes as to the functions of Medical Assessors and their precise mode of procedure.

SIR WILLIAM BABTIE AND THE ARMY COUNCIL

We noted last week the statement by the Under Secretary for War regarding Sir William Babtie's resumption of his duties at the War Office as Director of Medical Services. In reply to subsequent questions in the House of Commons Mr. Macpherson stated that the Army Council, after considering the explanation of Sir William Babtie in regard to Mesopotamia, came unanimously to the conclusion that it would be a great detriment to the public military service of this country if it were deprived of the continued services of Sir

William Babtie. The Council had therefore asked him to come back to the work which he was doing at the War Office and was doing exceedingly well. Mr. Macpherson said he was perfectly certain that any soldier with any knowledge of the work of the Army Medical Service in any of the campaigns with which Sir William Babtie's name had been associated would be of opinion that the Army Council acted rightly in continuing to use the services of a distinguished servant of the State. The report of the Committee of Inquiry on the Medical Service had not been received, and Mr. Macpherson was unable to say whether or not it would be presented to the House. It had been pointed out that the Director-General of Army Medical Services had no position on the Army Council. That matter had been considered by a representative committee before the war, which decided that it was not in the interests of the public service to place the Director-General on the Council. If any important question affecting the Army Medical Service arose and his experience was necessary for the Army Council, the Director-General was welcomed there, and every opportunity was given to him of stating the whole facts connected with the problem, and of making himself as useful as possible in helping the Army Council to its decision.

FOOD-SUPPLY ORGANISATION IN CANADIAN MILITARY HOSPITALS.—Instructions in connexion with the administration, conservation, and accounting of hospital supplies of military hospitals in England supported by the Canadian public have been issued in pamphlet form for the use of everyone directly concerned in the diet and food of the invalid soldier. Old-established orders as well as recent Army Council instructions are here brought together in a little book of 47 pages, interleaved with memoranda pages so that new orders and regulations may be inserted as they are issued. This interesting compilation may possibly be found useful by others than those directly responsible to the Canadian Army Medical Service.

THE number of officers and men receiving disability allowances from the Ministry of Pensions was approximately 225,000 on Oct. 1st last.

Medical News.

UNIVERSITY OF LONDON: COLONIAL EXAMINATIONS.—At examinations held recently the following candidates were successful:—

CEYLON (COLOMBO).

First Examination for Medical Degrees.—Gerald Samuel William de Saram, Appu Hennedige Don Stephen de Silva, Alan Raja Rutnam, and Kandiah Somasundram, Ceylon Medical College.

Second Examination for Medical Degrees, Part I.—Gerald Samuel William de Saram, Victor Emmanuel Perera Senewiratne, and Leanagé Don John Telesphor, Ceylon Medical College.

UNIVERSITY OF GLASGOW.—The following degrees were conferred on Nov. 10th:—

DOCTORS OF MEDICINE (M.D.).

Robert Thomson Leiper (honours), John Lindsay Boyd (commendation), William Henry M'Kinstry (commendation), David Smith (commendation), and Simon Harry Bennett.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—At an ordinary meeting of the Council was held on Nov. 8th, Mr. Charters J. Symonds, the senior Vice-President, being in the chair. It was resolved to issue Diplomas of Membership to 87 successful candidates. Sir Herbert Waterhouse was elected the representative of the College on the managing committee of the Schiff Home of Recovery. A letter was read from the solicitor of the College stating that he had been informed by Messrs. Few and Co. of the death of the Countess Rignon di Cigala, the last life-tenant of the fund constituting the Cline Bequest, and that he was making inquiries to ascertain what steps it would be necessary to take to transfer into the name of the College the French rentes forming the fund to which the College had now become entitled.—Sir George Makins and Sir John Bland-Sutton were appointed the representatives of the College on the Board of Scientific Societies for the year 1918.

Two series of lectures which are to be given at the College by Professor A. Keith are likely to prove of interest and use at the present time, particularly to those who have to treat disabilities arising from gunshot injury. In these lectures Professor Keith proposes to review the "Anatomical and Physiological Principles underlying the Treatment of Injuries to Muscles, Joints, and Bones." In the first series, which begins in the theatre of the College, Lincoln's Inn-fields, at 5 P.M. on Friday, Nov. 23rd, the discoveries and teaching of John Hunter, John Hilton, H. Owen Thomas, Stromeyer, Adams, Wolff, &c., are to be reviewed; in the second series, beginning on Jan. 14th, disabilities and deformities as they affect the various regions of the body will be considered. The various matters to be dealt with may be seen in the Medical Diary given in another column from week to week. The lectures will be illustrated by specimens drawn from the Army Medical Collection now on exhibition in the Museum of the College. The lectures are open to all medical men.

MEDICO-PSYCHOLOGICAL ASSOCIATION OF GREAT BRITAIN AND IRELAND.—The next quarterly meeting of the association will take place on Tuesday, Nov. 27th, at 11, Chandos-street, Cavendish-square, London, W., under the presidency of Lieutenant-Colonel David G. Thomson, R.A.M.C., at 3 P.M. On the same day and at the same place will meet: Educational Committee at 10.45 A.M.; Parliamentary Committee at 11.30 A.M.; Council at 1.45 P.M.

CLERICAL, MEDICAL, AND GENERAL LIFE ASSURANCE SOCIETY.—This society is to be congratulated upon a successful year of working during trying conditions. The report presented at the ninety-third annual general meeting, held at the society's office, 15, St. James's-square, S.W., on Nov. 2nd, shows that the net new life business was £806,305, as compared with £737,472 in 1915–16. The total premium income was £468,345, showing an increase of £12,015, and the gross interest income rose by £11,268 to £285,340. The claims by death amounted to £360,484, the total payments being within the amount expected. Special bonus payments of £260,937 have been made in addition to the ordinary outgoings. After meeting these the life assurance fund shows a decrease of £95,332, and now amounts to £6,095,669.

ROYAL MEDICAL BENEVOLENT FUND.—At the last meeting of the committee, held on Oct. 9th, 19 cases were considered, and £176 voted to 16 of the applicants. The following is a summary of some of the cases relieved:—

Widow, aged 60, of L.R.C.P. and S. Edin. who practised at Liverpool and died in 1894. Applicant has for some years acted as health visitor for a County Council, but owing to ill-health and increasing age will have to resign. Has recently had an operation on her foot. Income as visitor, £104 per annum. The Fund promised a grant of £12 per annum when she has to give up her work.—Daughter, aged 50, of M.B. Lond. who practised at Newcastle, Staffs., and died in 1885. Applicant lost all her income through bad investments, and her health is so bad that she is unable to work. Relieved three times, £29. Voted £12 in 12 instalments.—Daughter, aged 57, of M.R.C.S. Eng. who practised at Newport, Mon., and died in 1892. Has tried to earn a living by keeping a children's school, but owing to ill-health, and the high cost of living, cannot make it pay. Relieved twice, £24. Voted £12 in 12 instalments.—Widow, aged 72, of L.R.C.S. Irel. who practised in London and Wales and died in 1915. She was left entirely without means through long illness of husband. Has two daughters, one of whom is very delicate, and the other helps all she can. Has the old age pension. Relieved twice, £26. Voted £12 in 12 instalments.—Daughter, aged 60, of M.R.C.S. Eng. who practised at Wymondham and died in 1870. Applicant is quite unable to work, and the loss of her benefactress 14 years left her quite destitute. Relieved nine times, £52. Voted £12 in 12 instalments.—Daughters, aged 53 and 45, of L.S.A. Lond. who practised in London and died in 1903. One is an epileptic, and the other unable to earn a living. Joint income £69 a year. Relieved jointly nine times, £101. Voted £18 in 12 instalments.—Widow, aged 68, of L.S.A. Lond. who practised at Ipswich and died in 1901. Was left entirely without means, and has tried to earn a living by taking in lodgers. Has a family of five, four of whom are married, and only able to help slightly, so finds it difficult to get on. Relieved 14 times, £152. Voted £6 in six instalments, with leave to apply again in six months.—Daughter, aged 67, of M.D. Edin. who was a medical officer in the Army and died in 1898. Applicant is not entitled to any pension from the R.A.M.C., and her health has always been very bad, and has had to rely on help from friends, many of whom have recently died. Relieved once, £12. Voted £12 in 12 instalments.—Widow, aged 48, of M.R.C.S. Eng. who practised in London and New Zealand, and died in 1901. She was left unprovided for with three young children. She has endeavoured to make a living by taking in boarders, but her house being on the Essex coast she had not been able to make it pay since the war commenced, so has had to give it up. Her eldest son has joined a cadet school, with a view to taking a commission. Relieved six times, £71. Voted £10.—M.D. Glasg., aged 78, married, and who had practised in London. Applicant had to give up work a few years ago owing to ill-health, and the only income is an annuity his wife has, and an Epsom pension. Applicant has had several strokes. Relieved three times, £37. Voted £18 in 12 instalments.—Daughter, aged 51, of M.D. Glasg. who practised at Glasgow and died in 1897. Was left without means, and in consequence of ill-health has never been able to do much work. Has two small pensions from other societies, and is now assisting in the management of an hostel for girls, but only receives her board and lodging. Relieved three times, £30. Voted £10.—Widow, aged 56, of L.R.C.S. Glasg. who practised at Heaton-on-Tyne and died in 1899, leaving applicant unprovided for with six children. Three are now married and unable to help. Endeavours to make a living by taking in boarders. Relieved 12 times, £130. Voted £12 in 12 instalments.—Daughter, aged 56, of L.R.C.P. Lond. who practised at Birmingham and died in 1874. Endeavours to make a living by taking in lodgers, but has not been successful of late. Has only received £3 this summer. Relieved six times, £68. Voted £12 in 12 instalments.

Subscriptions may be sent to the acting honorary treasurer, Dr. Samuel West, 11, Chandos-street, Cavendish-square, London, W. 1.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

University Representation.

TEN Members to University constituencies in Great Britain are given by the Redistribution Schedule of the Representation of the People Act, which has been adopted in Committee in the House of Commons. As finally adjusted the University representation is allocated as follows:—

England and Wales.—University of Oxford, 2; University of Cambridge, 2; University of London, 1; Universities of Durham, Victoria (Manchester), Wales, Liverpool, Leeds, Sheffield, Birmingham, and Bristol, 2.

Scotland.—Universities of Edinburgh, St. Andrews, Glasgow, and Aberdeen, 3.

It was at first proposed that London University should be grouped along with the eight new English Universities, and that in combination they should return three Members. This proposal was modified by the House of Commons, which decided that London University should continue to be independently represented by a Member of its own, and that two Members should be returned by the other eight in combination. Irish University representation is not affected by the Bill.

Midwives (Ireland) Bill.

Mr. DUKE, the Chief Secretary for Ireland, has introduced in the House of Commons a Bill "to secure the better training of midwives in Ireland and to regulate their practice." It has been read a first time.

National Health Insurance Bill.

The effect of the National Health Insurance Bill, which Sir E. CORNWALL recently introduced in the House of Commons, is to make a long series of amendments in the existing Acts relating to National Health Insurance. It is a measure of 45 clauses. The first five are concerned with financial provisions. The other part of the Bill deals with such matters as qualifications for becoming voluntary contributors, rates of contribution in certain exceptional cases, membership of Approved Societies, arrears of contributions, transfers, payment of benefits, and so on.

Clause 31 contains provisions as to medical practitioners. The first subsection runs as follows:—

> Where the Insurance Commissioners in pursuance of their powers under Section 15 of the principal Act remove the name of any practitioner from any list of medical practitioners prepared under the said section they may, if they think fit so to do, remove his name from all or any of the other lists so prepared in which it is at the time included, and until such time as the Commissioners direct to the contrary that practitioner shall be disqualified for inclusion in any other list, whether in England, Scotland, or Wales, in which his name was not then so included or from which it was then removed.

HOUSE OF COMMONS.

WEDNESDAY, NOV. 7TH.

Officers in Territorial General Hospitals.

Major DAVID DAVIES asked the Under Secretary for War whether he would explain why captains serving as *à la suite* officers of the Territorial general hospitals were allotted precisely the same kind of work, the same hours of work, and bore the same responsibility for the treatment of their patients as lieutenant-colonels and majors attached to the same hospitals, whilst they received no temporary step in rank or addition to their pay.—Mr. MACPHERSON answered: The question of promotions to complete establishments of general hospitals is under consideration, but in all hospitals medical officers are frequently employed according to their professional aptitude and line of work, and, while senior officers are naturally given the more responsible duties, there is no reason why *à la suite* officers of captain's ranks, who are often of the highest professional standing, should not be employed in the same way.

Inoculation in the Army.

Mr. LYNCH asked the Under Secretary for War whether, in view of misconceptions as to antityphoid inoculation and prejudice against that form of treatment, he would direct his attention to a recent report on the subject communicated to the French Academy of Science by Dr. Richet, which showed the boon to the soldier, as well as to the State, conferred by this system of inoculation; whether he would have this document translated and circulated in quarters where it was likely to do good; and whether similar statistics referring to British forces would be published and laid upon the table of the House.—Mr. MACPHERSON replied: I am not familiar with the document to which my honourable friend refers, but the prejudice against antityphoid inoculation in the Army is negligible, and the course which he suggests is not considered necessary.

Mr. CHANCELLOR asked whether the 3000 who fell victims to typhoid in the Army in France were merely cases or deaths; whether they included cases of paratyphoid, dysentery, and diarrhœa; if not, how many cases, respectively, of these diseases had occurred and how many cases returned as P.U.O.; and what proportions of cases and what proportions of deaths from each of the diseases named arose amongst inoculated and uninoculated, respectively.—Mr. MACPHERSON said in reply: I am not aware what the figure of 3000 is to which my honourable friend is alluding. A hundred and eighty-four officers and men have died of enteric in France and 48 of paratyphoid. There have occurred 2321 cases of typhoid (enteric) and 3871 cases of paratyphoid. The totals for dysentery are not available, and it would take a long time to work them out. For diarrhœa it would be necessary to apply to France. I have no figures regarding P.U.O. (pyrexia, i.e., fever, of uncertain origin). Of the deaths from enteric—namely, 184—62 had been inoculated and 122 had not been inoculated. Of the 48 deaths from paratyphoid 39 had been inoculated and 9 had not been inoculated.

Mr. CHANCELLOR asked whether there were 50,000 cases of death from typhoid in the South African War; if not, would he say how many cases and how many deaths, respectively, occurred in that war from this disease; and whether inoculation was extensively practised in the Army in South Africa.—Mr. MACPHERSON answered: The number of cases of typhoid fever amongst the troops in the South African War was: officers 2066, other ranks 57,684; and of deaths: officers 205, other ranks 8022. Inoculation was not so extensively practised in the Army in South Africa as it is in the present campaigns.

Exchange of Prisoners.

Replying to Mr. PETO, Mr J. F. HOPE (representing War Prisoners Department) said: We have been informed this morning that the German authorities have agreed to the conditions suggested by us for the transport of exchanged prisoners to and from Holland. The date on which the first sailing will take place now rests solely on the choice of a route between Rotterdam and Boston, and I understand that this matter is now in the hands of the Admiralty.

THURSDAY, NOV. 8TH.

Renewal of Artificial Limbs.

Major CHAPPLE asked the Parliamentary Secretary to the Ministry of Pensions what proportion of limbless men supplied with artificial limbs were returning for renewals; whether he had evidence that this was due to the premature manufacture of the limb many months before full shrinkage of the stump had taken place; and whether he would send a commission to France and Italy to investigate the system of providing limbless men with temporary limbs, costing only a few shillings, pending the shrinking and moulding of stumps to their permanent condition.—Sir A. GRIFFITH-BOSCAWEN replied: It is recognised that a large portion of the men who are fitted with artificial legs have to return for the limb to be refitted within six months or a year, but it is not possible from available statistics to state the exact proportion. The refitting is necessitated by shrinking of the stump, but this shrinking will not take place simply as the result of the passage of time, but only as a result of the pressure of the socket of an artificial limb, so that there is no evidence that limbs are being fitted prematurely. The policy of supplying a provisional limb of a simple type before the fitting of the permanent limb is one on which surgical opinion is divided. It has been adopted in some cases, and its wider adoption is under consideration. It is unnecessary to send a commission of inquiry abroad, ample evidence being available in this country.

MONDAY, NOV. 12TH.

Infantile Mortality.

Mr. ANDERSON asked the President of the Local Government Board whether he would state the official estimate of the number of children dying every week whose death was due to preventible causes; why the Government delayed legislation on this matter; whether the vested interests of large insurance companies were a contributory cause of the delay; and whether he could make a statement as to any future action it was proposed to take.—Mr. HAYES FISHER replied: In 1916 the numbers of deaths of children under five years of age registered in England and Wales was 109,365. It is, of course, not possible to state exactly how many of these were due to preventible causes, but I am satisfied that if the local authorities in England and Wales were given the same powers as are now possessed by local authorities in Scotland and Ireland, and if they used them, as I have reason to know that they would do, the work which they are now doing in regard to infant welfare could be developed so as to effect great reductions in the numbers of deaths, and, may I add, not only of infants but of mothers. My department has for some time been anxious to secure for local

authorities this extension of powers and local authorities have pressed for them, but owing to the opposition from insurance organisations legislation has hitherto been delayed.

Medical Problems of the Air Service.

In moving the second reading of the Air Forces Bill, Major BAIRD (Parliamentary Secretary to the Air Board) said in the course of his speech: One of the most important needs is a specialised medical service. It has been found by experience that flying men are subject to many peculiar physical disabilities, and research into the prevention and cure of these disabilities has advanced very rapidly. So long, however, as the flying services remain merely as appendages to the Army and Navy it is very difficult to provide for the study of these medical matters and for the special treatment of the patient. Knowledge of the subject is almost entirely limited to those few medical officers and civil practitioners who have had considerable numbers of flying men continuously under their care, and it is necessary at once to take special measures to provide special accommodation for the cases and a separate staff to concentrate on the problems which have arisen. The mere selection of candidates for the flying services has become a highly specialised business, and the standard of fitness required for flying is diverging from the standard required for the ordinary naval and military services. There are many minor physical imperfections which render a man unfit for flying, but which, if taken in time, may be removed or cured. Still more important, many precautions have to be taken to enable pilots to maintain their fitness under the severe conditions of modern air warfare. These are only examples of the necessity of securing a body of men whose sole business will be to concentrate on this particular branch of medical science, which is necessary for the welfare of our flying men.

Treatment of Shell-shock in London.

Answering Colonel CLIVE on the question of the treatment of shell-shock patients in London, Mr. MACPHERSON wrote: It may be possible to discontinue the neurological centre in London as a treatment centre in connexion with the changes which are now being made.

TUESDAY, NOV. 13TH.

Contagious Disease in the Army.

Commander WEDGWOOD asked the Under Secretary for War whether the Army Council proposed to make use of the Defence of the Realm Act for the purpose of reintroducing any provision which would have the same effect as the Contagious Diseases Acts.—Mr. MACPHERSON answered: No, Sir, I am not aware of any such intention.

THE SERVICES.

ROYAL NAVAL MEDICAL SERVICE.

To be temporary Surgeons: B. L. Skeggs and J. B. Orr, D.S.O., M.C.

ARMY MEDICAL SERVICE.

Col. J. W. Bullen is retained on the Active List under the provisions of Articles 120 and 522 Royal Warrant for Pay and Promotion, and to be supernumerary.

Temp. Lieut.-Col. T. P. Legg, C.M.G., to be temporary Colonel.

TERRITORIAL FORCE.

Col. W. Kinnear relinquishes his commission on account of ill-health, and is granted permission to retain his rank and to wear the prescribed uniform.

ROYAL ARMY MEDICAL CORPS.

The undermentioned are granted temporary rank whilst serving with No. 83 (Dublin) General Hospital:—As Lieutenant-Colonel: H. C. Drury. As Majors: J. Lumsden, C. M. Benson, S. H. Law. As Captain: J. W. Killen.

The undermentioned officers are seconded for duty with a General Hospital: Lieut.-Col. (Brevet Col.) A. B. Gemmel, Major R. A. Bickersteth, Capt. R. W. MacKenna.

Lieut.-Col. A. W. Mackintosh is restored to the establishment.

Major (temp. Lieut.-Col.) J. G. Andrew and Capt. (temp. Major) J. Eason relinquish their temporary rank on an alteration in posting, and are restored to the establishment.

Temp. Major G. D. Gray to be acting Lieutenant-Colonel whilst in command of the Chinese General Hospital.

Temp. Major K. W. Monsarrat (Capt., R.A.M.C., T.F.) relinquishes his temporary commission on reposting to T.F.

E. W. Hore (Lieut.-Col., I.M.S., retired) to be temporary Major whilst employed with the Wharncliffe War Hospital.

Capt. F. E. Price is seconded for service overseas, and is restored to the establishment.

Temp. Capts. G. Schofield and K. F. Rogers, Canadian A.M.C., to be temporary Majors.

J. W. Darling, late temporary Captain, is granted the honorary rank of Captain.

Temp. Lieut. R. Franklin to be temporary Captain.

Temporary Lieutenants to be temporary Captains: A. V. Greaves (Canadian A.M.C.), R. W. Blackwell (Canadian Army Dental Corps), J. B. Anderson, J. Campbell, K. J. Aveling, G. Adam, A. Fleming, P. J. Verrall.

To be temporary Captains: L. E. Williams, H. C. Martin, C. D. Pile, D. Gillespie.

Temp. Hon. Lieut. R. A. Holmes to be temporary Honorary

To be temporary Lieutenants: W. Wright, J. M. Glas Naish, V. C. Pennell, W. H. Richardson, H. W. P. Young, E. G. M. Cameron, J. McCausland, H. M. Gilbertson, B. R. Vick Bradley, A. Evans, P. J. Flood, F. W. K. Lawrie, W. S. Git Howell, E. W. Atkinson, G. W. Clark.

To be temporary Honorary Lieutenants: S. R. Meaker, J. I J. M. Bremner.

Officers relinquishing their commissions: Temp. Capt. W. Temp. Lieut. M. A. Harrington, and Temp. Lieut. A. S. account of ill-health).

SPECIAL RESERVE OF OFFICERS.

J. F. van der Westhuyzen, late Captain, is granted the hono of Captain.

To be Lieutenants: W. L. Yell (from Aberdeen University Co O.T.C.), J. B. D. Galbraith, I. M. Robertson, T. R. Wilson, White, J. Macleod, and A. Riddell (from Glasgow University gent, O.T.C.).

TERRITORIAL FORCE.

Major L. B. Rawling is restored to the establishment.

Major A. S. F. Leyton relinquishes his commission on a ill-health.

Major A. Wilson vacates his appointment on the perma sonnel, and is restored to the list of officers available for mobilisation.

Capt. (temp. Major) D. H. de Souza relinquishes his tempo on alteration in posting, and is restored to the establishment.

Capt. (acting Lieut.-Col.) A. A. Hingston to revert to tempor on ceasing to command a Field Ambulance.

Capts. R. A. Brodrick, M.C., and C. L. Lander to be act tenant-Colonels whilst commanding a Field Ambulance.

Capt. W. B. Secretan is seconded for duty with a War Hospi

Capt. (acting Lieut.-Col.) G. S. Williamson relinquishes h rank on ceasing to command a Field Ambulance.

Capt. H. F. Wilkin, M.C., from Army Medical Service, to be

Capt. S. Acheson relinquishes his commission on accou health contracted on active service, and is granted the hono of Captain.

Temp. Lieut. and Medical Officer W. Langran to be t Captain, 5th Battalion, Devonshire Volunteer Regiment.

TERRITORIAL FORCE RESERVE.

To be Captains: Capt. C. C. Messiter, from R.A.M.C.; Capt. from R.A.M.C.; Capt. W. J. Lacy-Hickey, from R.A.M.C.; Porter, from R.A.M.C.

Capt. R. G. Wills relinquishes his commission on accou health.

URBAN VITAL STATISTICS.

(Week ended Nov. 10th, 1917.)

English and Welsh Towns.—In the 96 English and Welsh to an aggregate civil population estimated at nearly 17,000,00 the annual rate of mortality was 11·8, against 12·0 and 12·6 in the two preceding weeks. In London, with a popul ceeding 4,000,000 persons, the death-rate was 12·5, or 0·5 below that recorded in the previous week; among the r towns the rates ranged from 5·0 in Blackpool, 5·6 in Le 5·7 in Lincoln to 16·5 in Exeter, 17·0 in Liverpool, an Sunderland. The principal epidemic diseases caused 246 deat corresponded to an annual rate of 0·8 per 1000, and included 70 infantile diarrhœa and measles, 51 from diphtheria, 36 from w cough, 10 from scarlet fever, and 9 from enteric fever. The de diarrhœa, which had declined from 278 to 114 in the five weeks, further fell to 70, and included 18 in London, 6 in Birm and 4 each in Liverpool, Manchester, Leeds, and Gateshead. cases of scarlet fever and 1469 of diphtheria under treatment Metropolitan Asylums Hospitals and the London Fever Hosp respectively 3 below and 60 above the numbers remaining at th the preceding week. Of the deaths from all causes in the 122 resulted from violence. The causes of 42 deaths were un of which 9 were registered in Birmingham, 7 in Liverpool, a in Darlington, Sunderland, and Gateshead.

Scotch Towns.—In the 16 largest Scotch towns, with an a population estimated at nearly 2,500,000 persons, the annual mortality was 11·9, against 11·4 and 12·3 per 1000 in the two p weeks. The 254 deaths in Glasgow corresponded to an rate of 11·9 per 1000, and included 3 each from diphtheria and diarrhœa, 2 from whooping-cough, and 1 from measles. The in Edinburgh were equal to a rate of 14·0 per 1000, and include diphtheria and 1 from whooping-cough.

Irish Towns.—The 145 deaths in Dublin corresponded to a rate of 18·9, or 3·5 per 1000 in excess of that recorded in the week, and included 4 from infantile diarrhœa, 2 from measl each from scarlet fever, whooping-cough, and diphtheria. deaths in Belfast were equal to a rate of 14·9 per 1000, and 1 fatal case each of enteric fever, measles, whooping-cou diarrhœa.

Appointments.

Successful applicants for vacancies, Secretaries of Public Insti and others possessing information suitable for this colu invited to forward to THE LANCET *Office, directed to Editor, not later than 9 o'clock on the Thursday morning week, such information for gratuitous publication.*

REID, P., has been appointed Certifying Surgeon under the and Workshop Acts for the Cleator District of the co Cumberland.

WILSON, A. S., Certifying Surgeon under the Factory and Worksh Acts for the Hastings District of the county of Sussex.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index).
When the application of a Belgian medical man would be considered the advertisers are requested to communicate with the Editor.

BARNET, CLARE HALL SANATORIUM, South Mimms.—Temporary Assistant Medical Officer. Salary at rate of £250 per annum, with board, &c.
BRADFORD CITY.—Temporary Assistant School Medical Officer. Salary 8 guineas per week.

LONDON LOCK HOSPITAL, Dean-street, Soho, W.—House Surgeon for six months. Salary at rate of £150 per annum, with board, &c.
NETLEY, BRITISH RED CROSS HOSPITAL.—Anæsthetist.
NEW HOSPITAL FOR WOMEN, Euston-road.—Female House Physician, Obstetric Assistant, Two House Surgeons, all for six months. Salary at rate of £50 per annum, with board, &c. Also Resident Medical Officer at House of Recovery, New Barnet, for six months. Salary at rate of £60 per annum. Also Clinical Assistants and Anæsthetists.
NOTTINGHAM GENERAL HOSPITAL.—Female Casualty House Surgeon for six months. Salary at rate of £250 per annum, with board, &c.
NORTHAMPTONSHIRE SANATORIUM, Creaton, near Northampton.—Medical Superintendent. Salary £500 per annum, with board, &c.
PRESTON ROYAL INFIRMARY.—Resident Medical and Surgical Officer. Salary £120 per annum, with board, &c.
QUEEN'S HOSPITAL FOR CHILDREN, Hackney-road, Bethnal Green, E.—House Surgeon for six months. Salary £100 per annum, with board, &c.
RECUPERATIVE HOSTELS (FOR SAILORS AND SOLDIERS INVALIDED FROM H.M. SERVICES WITH NERVE-STRAIN), 43-45, Fitzjohn's-avenue, N.W.—Honorary Neurologist and Honorary Laryngologist. Also Resident Medical Officer. Salary £400 per annum.
ROTHERHAM HOSPITAL.—Junior House Surgeon. Salary £150, with board, &c.
ROYAL COLLEGE of PHYSICIANS. Pall Mall East.—Milroy Lecturer.
WARWICKSHIRE COUNTY COUNCIL.—Assistant County Medical Officer of Health. Salary £325 per annum.
WINCHESTER, ROYAL HAMPSHIRE COUNTY HOSPITAL.—Assistant Resident Medical Officer. Salary £150 per annum, with board, &c.
WOLVERHAMPTON AND STAFFORDSHIRE GENERAL HOSPITAL.—House Surgeon for six months. Salary at rate of £200 per annum, with board, &c.

Births, Marriages, and Deaths.

BIRTHS.

STEINBACH.—On Nov. 4th, at Newton House, Knaresborough, the wife of Horace Steinbach, M.R.C.S., L.R.C.P. Lond., of a daughter.

MARRIAGES.

GLEGG—TYNDALE.—On Nov. 6th, at SS. Philip and James, Oxford, Wilfrid Glegg, M.D., M.R.C.P.E., to Marcia Edersheim, youngest daughter of the late Rev. E. F. G. Tyndale and of Mrs. Tyndale, Fyfield-road, Oxford.
MARRIOTT—FOOKS.—On Nov. 8th, by licence, at Beckenham Parish Church, Captain F. K. Marriott, M.C., R.A.M.C., to Dora Eveline, of Freathmore, Lower Bourne, Farnham, granddaughter of the late Robert Fooks, of Bridport, Dorset, and the late William Wallace Dunning.

DEATHS.

GRAHAM.—On Nov. 5th, at Purdysburn House, Co. Down, the result of an accident, Lieutenant-Colonel Graham, M.D., Belfast War Hospital, and Medical Superintendent, Purdysburn Villa Colony Asylum, Belfast.
RANDALL.—Killed in action, on Oct. 31st, John Beaufoy Randall, Captain, R.A.M.C., M.B., M.S. Lond., M.R.C.S., L.R.C.P., B.Sc., aged 28 years.

N.B.—A fee of 5s. is charged for the insertion of Notices of Births, Marriages, and Deaths.

Notes, Short Comments, and Answers to Correspondents.

THE MANDRAKE IN FOLK-MEDICINE.

THE root of the mandrake (*Atropa mandragora, M. officinarum*) is a ready-made amulet, resembling, as it does, the lower limbs of a human being and often a grotesque human body. A naked mannikin may suggest to primitive minds all kinds of thoughts. Hence in Scripture the fruit or root of the mandrake figures as a love-charm (Genesis xxx.), by means of which Rachel is enabled to escape the reproach of barrenness and to become the mother of Joseph. At a later period, as is shown by Professor Sir James G. Frazer in his recently published monograph on "Jacob and the Mandrakes," the root, rather than the fruit of the plant, became a sovran amulet. Solomon, according to "the Arab Dioscorides," Ibn Beithar, carried a mandrake in his signet ring, which gave him command over the jinn, or spirits. The plant, Ibn Beithar avers, is a remedy for all maladies caused by jinn, demons, and Satan. It cures lameness, cramp, epilepsy, elephantiasis, madness, loss of memory, besides affording protection against every kind of mishap. The mandrake root was well known as a charm to the ancient Greeks and to Pliny and the Romans, and it reappears in the Middle Ages as the centre of a perfect tangle of sinister superstition. As a rule the plant was held to spring up under the gallows, where it was fertilised by the drippings of corpses. In order to obtain it a laborious ritual had to be observed. It was death to dig it up, so its roots were carefully loosened, and a dog, preferably black, was tied to it, which, springing after its master or tempted by food, drew the plant out of the ground and died in the act, while the plant shrieked dolefully. The evil genius having left the plant and passed into the dog, the root might be safely handled and used as a valuable ingredient in the pharmacopœia, where it figured as a promoter of conception and as a cure-all. The Transylvanian gipsies still practise this ritual. In Syria and the East generally the mandrake is still used as a charm, and the making of counterfeit mandrakes, closely resembling hairy ape-like men, is carried on as an industry. Sham mandrakes are often sold for large sums.

"To make the counterfeit mandrake," says "A Thousand Notable Things" (London and Salisbury, 1791), "which hath been sold by deceivers for much money, do thus as followeth: Take the great double root of Briony, newly taken out of the ground, and with a fine sharp knife frame the shape of a man or a woman ['the woman drake' of our rustics] ..... with his stones and cods, and other members thereto, and when it is clean done, prick all these places with a sharp steel, as the head, the eyebrows, the chin, and privities, and put into the said holes the seeds of millet, or any other that brings forth other small roots, that do resemble hairs (which Leek seed will do very well, or else Barley). After this, put it into the ground, and let it be covered with earth, until it have gotten upon it a certain little skin, and then thou shalt see a monstrous idol, and hairy, which will become the party, if it be workman like, or cunningly made or figured." The quotation is from Mizaldus. "Another trim way for the like, is in the *Natural and Artificial* conclusions, englished by Thomas Hill."

It is curious to reflect that this quotation from Mizalde was served up to our great grandmothers as lately as 1791. Present-day rustics attach great virtue to the mandrake root, which is eaten as a cure for indigestion. The root is said to taste bitter, but the fruit can be eaten, a little at a time, and the fruit, perhaps, rather than the root, was the ancient mandragora, used as an anæsthetic or narcotic, and known as such to Shakespeare, who, always keenly reflecting the popular beliefs of his age, makes Iago say to his dupe—

> "Not poppy, nor mandragora,
> Nor all the drowsy syrups of the world,
> Shall ever medicine thee to that sweet sleep
> Which thou owedst yesterday."

The literature of the mandrake is enormous. Perhaps one of the best accounts of it was given by Mary Howitt in her poem "The Mandrake," which figured in her charming work "Birds and Flowers and Other Country Things," published in 1838.

THE address of the Department of the Medical Director General of the Navy is now 12, Charles-street, Berkeley-square, London, W.1.

The following journals, magazines, &c., have been received:—Archives Médicales Belges, Veterinary Review, Cleveland Medical Journal, Annales de Medicina e Cirurgia, Medical Review, Archives of Internal Medicine, Archives of Pediatrics, Revista Odontologica, Therapeutic Gazette, Canadian Medical Association Journal, Military Surgeon, Edinburgh Medical Journal, British Journal of Dental Science, Maryland Medical Journal, Canadian Practitioner, American Medicine.

Medical Diary for the ensuing Week.

SOCIETIES.

ROYAL SOCIETY, Burlington House, London, W.

THURSDAY.—Papers:—Mr. C. H. Browning and Mr. R. Sulbransen: Bactericidal Properties conferred on the Blood by Intravenous Injections of Diamino-acridine-sulphate (communicated by Prof. R. Muir).—Mr. W. D. Lang: The Pelmatoporinæ, an Essay on the Evolution of a Group of Cretaceous Polyzoa (communicated by Dr. F. A. Bather.

ROYAL SOCIETY OF MEDICINE, 1, Wimpole-street, W.

Tuesday, Nov. 20th.

GENERAL MEETING OF FELLOWS, at 5 P.M.

Ballot for Election to the Fellowship. (Names have already been circulated.)

MEETINGS OF SECTIONS.

Wednesday, Nov. 21st.

HISTORY OF MEDICINE (Hon. Secretaries—J. D. Rolleston, Charles Singer): at 5 P.M.

Conjoint Meeting with the FOLK LORE SOCIETY.

Paper:

Dr. R. R. Marett: The Medicine Man.

Exhibition of Books, Pictures, &c. (at 4.30 P.M.).

Friday, Nov. 23rd.

STUDY OF DISEASE IN CHILDREN (Hon. Secretaries—A. S. Blundell Bankart, G. E. C. Pritchard, C. P. Lapage): at 4.30 P.M.

Cases will be shown.

MEDICAL SOCIETY OF LONDON, 11, Chandos-st., Cavendish-sq., W.

MONDAY.—8.30 P.M., Resumed Discussion on the Value and Limitations of Sanatorium Treatment for Tuberculosis.

LONDON DERMATOLOGICAL SOCIETY, St. John's Hospital, 49, Leicester-square, W.C. 2.

TUESDAY.—4.15 P.M., Cases sent for Consultation. Demonstration of Pathological Specimens. 4.30 P.M., The President's Address. 4.45 P.M., Exhibition of Clinical Cases by Dr. M. Dockrell, Dr. J. L. Bunch, Dr. W. K. Sibley, and Capt. W. Griffith.

ROYAL SOCIETY OF ARTS, John-street, Adelphi, W.C.

WEDNESDAY.—4.30 P.M., Address:—Mr. A. A. C. Swinton: Science and its Functions.

ROYAL MICROSCOPICAL SOCIETY, 20, Hanover-square, W. 1.

WEDNESDAY.—8 P.M., Paper:—Mr. E. Heron-Allen and Mr. A. Earland: On Some Foraminifera from the North Sea, &c. V., On Thurammina Papillata, Brady: A Study in Variation. Mr. F. M. Duncan: An Exhibition of Lantern-slides in illustration of his paper read at the last meeting.

LECTURES, ADDRESSES, DEMONSTRATIONS, &c.

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C.

Museum Demonstrations (Pathology) for Medical Students and Practitioners and First-Aid and Ambulance Students:—

MONDAY.—5 P.M., Mr. S. G. Shattock: Inflammation and Gunshot Injuries.

POST-GRADUATE COLLEGE, West London Hospital, Hammersmith-road, W.

MONDAY.—2 P.M., Medical and Surgical Clinics. X Rays. Mr. Gray: Operations. Mr. B. Harman: Diseases of the Eye. Dr. Simson: Diseases of Women.

TUESDAY.—2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. Dr. Banks Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin.

WEDNESDAY.—10 A.M., Dr. Arthur Saunders: Diseases of Children. Dr. Banks Davis: Operations of the Throat, Nose, and Ear. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations.

THURSDAY.—2 P.M., Medical and Surgical Clinics. X Rays. Mr. Gray: Operations. Mr. B. Harman: Diseases of the Eye.

FRIDAY.—10 A.M., Dr. Simson: Gynæcological Operations. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. Dr. Banks Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin.

SATURDAY.—10 A.M., Dr. Arthur Saunders: Diseases of Children. Dr. Banks Davis: Operations of the Throat, Nose, and Ear. Mr. B. Harman: Eye Operations. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N. 15

MONDAY.—2.30 P.M., Children's Diseases: Dr. T. R. Whipham. Gynæcological Diseases: Mr. F. L. Provis. Surgical Operations: Mr. E. Gillespie. 3 P.M., Medical In-patients: Dr. R. M. Leslie. 7 P.M., Venereal Clinic: Dr. Kinsella. 3.30 P.M., Special Demonstration:—Dr. T. R. Whipham: Selected Cases of Children's Disease.

TUESDAY.—10 A.M., Surgical Operations: Mr. J. Howell Evans. 2.30 P.M., Medical Out-patients: Dr. A. G. Auld. Surgical Out-patients: Mr. Howell Evans. Nose, Ear, and Throat Diseases: Mr. C. H. Hayton. X Rays: Dr. Metcalfe. 3.30 P.M., Medical In-patients: Dr. A. J. Whiting.

WEDNESDAY.—2.30 P.M., Medical Out-patients: Dr. T. R. Whipham. Diseases of the Skin: The Dermatologist. Eye Diseases: Mr. A. S. Worton. Operations:—Nose, Ear, and Throat: Mr. Hayton; 4 P.M., Eyes: Mr. Worton. 5 P.M., Venereal Clinic: Mr. E. Gillespie and Mr. Benians.

THURSDAY.—2.30. P.M., Medical Out-patients, Dr. A. J. Whiting. Surgical: Mr. H. W. Carson. X Rays: Dr. Metcalfe. Gynæcological Operations: Dr. A. E. Giles. 3.30 P.M., Medical In-patients: Dr. R. M. Leslie.

FRIDAY.—2.30 P.M., Surgical Out-patients: Mr. Gillespie. Eye Diseases: Mr. A. S. Worton. 7 P.M., Venereal Clinic: Mr. E. Gillespie and Mr. Benians.

SATURDAY.—2.30 P.M., Surgical Operations: Mr. H. W. Carson.

THE THROAT HOSPITAL, Golden-square, W.

MONDAY.—5.15 P.M., Special Demonstration of Selected Cases.

THURSDAY.—5.15 P.M., Clinical Lecture.

ST. JOHN'S HOSPITAL FOR DISEASES OF THE SKIN, 49, Leicester-square, W.C.

TUESDAY.—4 P.M., Dr. J. L. Bunch: Itching Skin Diseases and their Treatment.

THURSDAY.—5 P.M., Chesterfield Lecture:—Dr. M. Dockrell: The Treatment of Eczema.

EDITORIAL NOTICES.

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITOR," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention should be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

Lectures, original articles, and reports should be written on one side of the paper only, *and when accompanied by blocks it is requested that the name of the author, and if possible of the article, should be written on the blocks to facilitate identification.*

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers—not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET should be addressed "To the Manager."

We cannot undertake to return MSS. not used.

Offices: 423, STRAND, LONDON, W.C. 2.

MANAGER'S NOTICES.

TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, London, W.C. 2, are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and not to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

THE COLONIAL AND FOREIGN EDITION is published in time to catch the weekly Friday mails to all parts of the world.

TO COLONIAL AND FOREIGN SUBSCRIBERS.

Subscribers abroad are particularly requested to note the rates of subscriptions given on page 51.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the rates shown, whatever be the weight of any of the copies so supplied.

METEOROLOGICAL READINGS.

(Taken daily at 8.30 a.m. by Steward's Instruments.)

THE LANCET Office, Nov. 14th, 1917.

DIRECT HITS have been obtained on the enemy's important chemical interests, e.g., Salvarsan, Neosalvarsan, Aspirin, Phenacetin, Urotropine, Eucaine, Cocaine, Atropine, Homatropine, Pilocarpine, Salicylates, Glycerophosphates, Photo Chemicals, etc. The raid is still in progress.

Boots Pure Drug Company Limited.

Keeping abreast with Medical Research

THE influence which medical research has on medical practice is more directly effective when accompanied by the immediate manufacture in marketable quantities of new compounds which are discovered. Of interest to the profession, no doubt, is the fact that Boots Pure Drug Co. Limited, are manufacturing synthetic and natural organic drugs of unsurpassed purity and excellence. They can supply immediately to the medical profession all the new antiseptics used by Dakin and his colleagues in their researches, which are described in various issues of the *B.M.J.* The attention of medical men is directed to

Oil solution of

Dichloramine-T

(toluene-p-sulphodichloramine)

FOR USE IN SURGERY AND NASAL ANTISEPSIS.

A complete outfit, containing the necessary drug, prepared oils, and atomiser, suitable for the treatment described and recommended by Dunham & Dakin in the *B.M.J.* of June 30th, 1917, page 865, for the disinfection of the naso-pharynges of carriers, is supplied by Boots Pure Drug Co. Limited. Supplies of Dichloramine-T are also available for prescription service on application through any of the 580 branches of Boots The Chemists.

Price of complete Outfit, 7/6 post free; or without Atomiser, 5/-

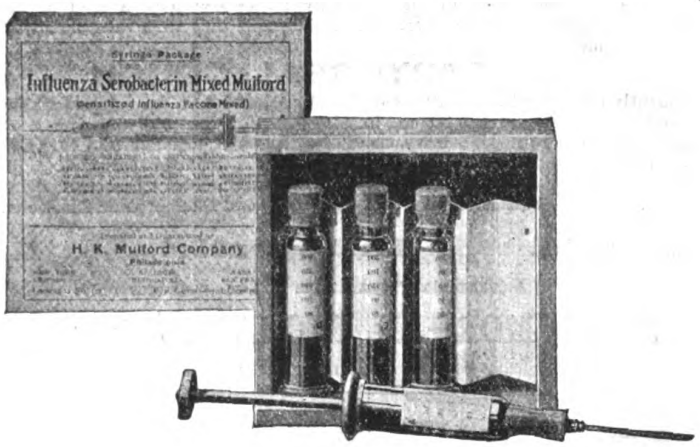
Boots Pure Drug Co. Limited.

HEAD OFFICES: STATION STREET

NOTTINGHAM.

JESSE BOOT, Managing Director.

Also Manufacturers of Chloramine-T, Proflavine, Acriflavine &c. &c.



Special terms to the Medical Profession.

Chloramine-T, while freely soluble in water, is practically insoluble in oils. But the corresponding dichloramine (toluene-*p*-sulphodichloramine, $CH_3.C_6H_4.SO_2NCl_2$, to which we now propose to assign the abbreviated name of dichloramine-T), though very sparingly soluble in paraffin oil, is quite readily dissolved in eucalyptol. The resulting solution can be subsequently diluted with paraffin. In this way a reasonably bland oil solution, containing as much as 2 per cent. of the dichloramine, can be obtained. It is with such solutions of different strengths that our second series of experiments was made.†

"An Ounce of Prevention Is Worth a Pound of Cure"

Immunize your patients against Influenza

and "Colds" NOW and do not wait until respiratory affections are prevalent.

Influenza Serobacterin Mixed Mulford will give immunity from attacks of "Colds" and influenza to a large percentage of patients suffering with periodic attacks of disease of the respiratory passages caused by the organisms used in preparing the serobacterin.

Supplied in packages containing four aseptic glass syringes.

Syringes contain killed sensitized bacteria as follows:

	Syringe A	Syringe B	Syringe C	Syringe D
B. influenzæ	125	250	500	1000 million
Staphylococcus albus	125	250	500	1000 million
Staphylococcus aureus	125	250	500	1000 million
Streptococcus	125	250	500	1000 million
Pneumococcus	125	250	500	1000 million
M. catarrhalis (group)	125	250	500	1000 million

Antikamnia Tablets

Strongly Recommended in:

INFLUENZA & LA GRIPPE

For the headache, pain, and general soreness give a five-grain Antikamnia Tablet crushed with a little water; if the pain is very severe two tablets should be given. Repeat every 2 or 3 hours as required. One single ten-grain dose is often followed by complete relief.

NEURALGIA

In the Treatment of Neuralgia and Myalgic Pains Antikamnia Tablets are not only palliative, but, along with other measures, assist in ultimate cures; they also have a field of use in Rheumatic and Gouty Affections. In Neurasthenia, Hysteria, and Migraine they are a valuable adjuvant to the other recognised therapeutic measures.

LARYNGEAL COUGH

Frequently remains after an attack of La Grippe, and has been found stubborn to yield to treatment. There is an irritation of the larynx, huskiness, and a dry and wheezing cough, usually worse at night. The prolonged and intense paroxysms of coughing are controlled by **ANTIKAMNIA & CODEINE TABLETS**, and with the cessation of the coughing the laryngeal irritation subsides.
Antikamnia Tablets are the least depressing of all the drugs that can exercise so extensive a control of pain, and also least disturbing to the digestive and other organic functions.

Analgesic. Antipyretic. Anodyne.

Antikamnia Preparations in 1-oz. packages only.

JOHN MORGAN RICHARDS & SONS Ltd.,
46-47, Holborn Viaduct, LONDON.

Glycolactophos

This preparation being British, inability to obtain supplies need not be anticipated.
FORMULA.—Casein 95%, Glycerophosphate of Sodium 2½%, Glycerophosphate of Calcium 2½%.
Its use is indicated in the treatment of Neurasthenia, Tabes Dorsalis, Neuralgia, Nervous conditions in which an excess of phosphates are excreted in the urine, Phthisis, Chronic Dyspepsia, Anæmia, Insomnia, and wasting diseases generally.
The presence of the Calcium salt gives it a high therapeutic value in the treatment of Rickets.
SAMPLES AND PARTICULARS SENT FREE TO THE MEDICAL PROFESSION ON REQUEST.

BLENOSAN
CAPSULES

As a routine
treatment for

GENITO-URINARY CONDITIONS.

BLENOSAN is a mixture of the finest East India Santal Oil with a specially prepared fluid extract of Kava-Kava. It is presented in the form of accurately-measured Capsules, and affords an ideal medicament for the treatment of all inflammatory conditions of the urethra.

BLENOSAN is an improvement upon the ordinary Santal, and the full proportion of the alpha resin of Kava-Kava ensures all the anæsthetic and diuretic properties of the root in a standardised and dependable form.

BLENOSAN CAPSULES consequently are indicated in all pathological conditions which affect the genito-urinary system, including acute Cystitis, Vaginitis, and Leucorrhœa, and where intense hyperæmia and swelling of the mucous membrane give rise to a diminution of the urinary canal.

BLENOSAN CAPSULES are well adapted for the continuous and systematic treatment of such cases, and are being used with excellent results by many of the most experienced and successful Physicians.

BLENOSAN CAPSULES can be prescribed for a course of treatment extending over two or three weeks.

KEROL

KEROL combines all the properties which go to the making of an ideal preparation.

It has been shown to be practically non-toxic, non-irritant and non-corrosive—a combination of properties which make it the one preparation which can be used with perfect confidence wherever the use of either a disinfectant or antiseptic is indicated. It is of high and definite germicidal value and is perfectly homogeneous

KEROL is highly recommended by Bacteriologists and by prominent members of the Medical Profession.

KEROL CAPSULES

INTESTINAL. These are of great value where intestinal antisepsis is indicated. In a comparatively short space of time the coli content of the intestine is reduced by over 99 per cent. They are non-irritant and perfectly safe

STOMACHIC. For use in cases of stomach fermentation and other gastric troubles, and are of great value in reducing the number of malign organisms prior to administration of treatment with lactic ferments, i.e., sour milk, etc.

ORAL SEPSIS.

"EUMENTHOL JUJUBES"

(HUDSON).

Made in Australia.

A Gum pastille containing the active constituents of well-known Antiseptics, Eucalyptus (a well-rectified Oil free from aldehydes (especially valeric aldehyde), which make themselves unpleasantly noticeable in crude oils by their tendency to produce coughing), Thymus Vulg., Pinus Sylvestris, Mentha Arv., with Benzo-borate of Sodium, &c., they exhibit the antiseptic properties in a fragrant and efficient form. Non-coagulant antiseptic and prophylactic, reducing sensibility of mucous membrane.

THE LANCET says:—

"In the experiments tried the Jujube proved to be as effective bactericidally as is Creosote."

Mr. W. A. DIXON, F.I.C., F.C.S.,
Public Analyst of Sydney, after making exhaustive tests, says:—

"There is no doubt but that 'Eumenthol' Jujubes have a wonderful effect in the destruction of bacteria and preventing their growth. ..... I have made a comparative test of 'Eumenthol' Jujubes and Creosote, and find that there is little difference in their bactericidal action."

THE PRACTITIONER says:—

"They are recommended for use in cases of oral sepsis, a condition to which much attention has been called in recent years as a source of gastric troubles and general constitutional disturbance, and are also useful in tonsillitis, pharyngitis, &c."

The AUSTRALASIAN MEDICAL GAZETTE:

"Should prove of great service."

The New Patent "Phonophore" Stethoscope (Fig. A.) 8/6

Ditto Chest piece (Fig. B.) 7/6

Ditto Single flexible (Fig. C.) 9/9

Ditto Double flexible (Fig. D.) 13/6

Ditto Binaural (Fig. E.) 16/6

Ditto Folding (Fig. F.) 17/6

COPIES OF UNSOLICITED TESTIMONIALS.

DEAR SIRS,—"I find that most certainly the chest sounds are rendered clearer and more distinct by your 'Phonophore' than by any stethoscope I have used during over thirty years' work."—Yours, F.R.C.S.

DEAR SIRS,—"I may say I am very pleased with the Phonophore. It renders chest sounds more audible and more distinct than any instrument I have so far used."—Yours faithfully.

DEAR SIRS,—"I have used the Phonophore for twenty years, and have never come across a better stethoscope."—Yours faithfully.

Extract from the "British Medical Journal":—"Some years ago Messrs. Arnold & Sons, of Giltspur-street, E.C., brought out a Stethoscope which they named the 'Phonophore.' Its construction secured a considerably increased volume of sound, and the appliance gained favour among those dissatisfied on general grounds with ordinary stethoscopes, or whose needs, owing to some lack of aural acuity, were not adequately met thereby. Of this appliance the same firm has recently brought out a modification in which the bell-like attachment constituting the chest-piece is provided with two sound tubes instead of one. These tubes are continued upwards, the sound thus being conveyed to each ear direct from the collecting chamber. The gross volume of sound is also greater than supplied even by the original 'Phonophore.' This modification of the 'Phonophore' is worth examination by anyone interested in stethoscopy."

ARNOLD & SONS, SURGICAL INSTRUMENT MANUFACTURERS, **Giltspur Street, London, E.C.1**

(J. E. ARNOLD, E. R. ARNOLD.) Telegraphic Address: "INSTRUMENTS, LONDON." Telephone Nos. 5240 City (3 lines).

A Government Decree

Our fighting men—by Government decree—wear pure wool next the skin. Medical opinion upholds this command—the health of the men proves its value.

For fifty years doctors have advised Wolsey because it is *pure wool*. To-day, though wool is scarce and dear, Wolsey remains pure wool—untampered with, uncheapened in its quality. Forced upwards by the increased cost of wool, the price of Wolsey has risen. But Wolsey is worth its extra cost.

Wolsey

Pure Wool Underwear

The Wolsey machinery is busily engaged in making underwear for the troops—their urgent needs come first. Wolsey should now be ordered in advance to ensure supply. Wolsey garments are made for men, women, and children. Any garment found to shrink is replaced free of cost.

THE WOLSEY UNDERWEAR CO., LEICESTER.

PRINTED and PUBLISHED by the PROPRIETORS, WAKLEY AND SON (1912), LTD., at No. 423 Strand, and Nos. 1 and 2, Bedford-street, adjoining, in the County of London,—Saturday, Nov. 17th, 1917.

SAUNDERS' BOOKS

Recently Issued

DISEASES OF THE EYE

Eighth Edition

By G. E. DE SCHWEINITZ, M.D., Professor of Ophthalmology, University of Pennsylvania. Octavo of 754 pages, with 386 illustrations and 7 coloured plates. Cloth, 25s. net.

"Its outstanding merit is the abundant reference to all the most valuable contributions to the literature of the subject in recent years, and Dr. de Schweinitz succeeds in incorporating these details without marring the general perspective—no easy task. ..... We can cordially recommend the book as belonging to the small group of the very best text-books on ophthalmology." —THE LANCET.

A Complete Work

LOCAL ANÆSTHESIA

Fully Illustrated

By CARROLL W. ALLEN, M.D., Instructor in Clinical Surgery at Tulane University of Louisiana. With an Introduction by RUDOLPH MATAS, M.D. Octavo of 608 pages, 255 illustrations. Cloth, 25s. net.

"Every surgeon who wishes to place at the disposal of his patients the full advantages to be gained from recent advances in our knowledge should gladly study the records and results of Dr. Allen's work."—DUBLIN JOURNAL OF MEDICAL SCIENCE.

A New Work

SURGERY OF SPINE

Recently Issued

By CHARLES A. ELSBERG, M.D., Professor of Clinical Surgery, New York University. Octavo of 330 pages, with 158 illustrations, 3 in colours. Cloth, 21s. net.

"Dr. Elsberg's work attains a very high standard, and including, as it does, his own extensive and matured experience, we should like it to be in the hands of every surgeon before undertaking a laminectomy."—EDINBURGH MEDICAL JOURNAL.

Recently Issued

STOMACH, INTESTINES & PANCREAS

New (3rd) Edition

By ROBERT COLEMAN KEMP, M.D., Professor of Gastro-Intestinal Diseases, New York School of Clinical Medicine. Octavo of 1096 pages, with 428 illustrations. Cloth, 30s. net.

"The writer's intention has been to provide a practical reference book for general practitioners, and in this object he has succeeded. ..... We have pleasure accordingly in commending it to our readers."—DUBLIN JOURNAL OF MEDICAL SCIENCE.

Fifth Edition

GENERAL BACTERIOLOGY

Thoroughly Revised

By EDWIN O. JORDAN, Ph.D., Professor of Bacteriology in the University of Chicago. Octavo of 647 pages, illustrated. Cloth, 15s. net.

"The popularity of the book is no doubt due to its comprehensive nature and general excellence."—DUBLIN JOURNAL OF MEDICAL SCIENCE.

New (8th) Edition

DISEASES OF THE SKIN

A Standard Work

By HENRY W. STELWAGON, M.D., Professor of Dermatology, Jefferson Medical College, Philadelphia. Octavo of 1250 pages, 334 text-cuts, 33 plates. Cloth, 28s. net.

"A careful, reliable text-book which will be of value to the whole dermatological world. ..... It is thoroughly up to date, and, in our opinion, sound."—BRITISH JOURNAL OF DERMATOLOGY.

New (13th) Edition

PRACTICE OF MEDICINE

Just Issued

By JAMES M. ANDERS, M.D., Ph.D., LL.D., Professor of the Theory and Practice of Medicine and of Clinical Medicine, Medico-Chirurgical College of Philadelphia. Octavo of 1335 pages, illustrated. Cloth, 25s. net.

"This revision must have necessitated a very wide examination of special monographs, pamphlets, and journals, since many of the matters treated have as yet found their way into but few text-books. Questions of diagnosis and treatment are discussed with special care."—THE LANCET.

THE MEDICAL PUBLISHING COMPANY, LTD., 23, BARTHOLOMEW CLOSE, E.C.

Thirty-fifth Year. **NOW READY.** *Fully illustrated in Colours, and Black and White.* **10/- net.**

THE

MEDICAL ANNUAL, 1917

BY TWENTY-SEVEN DISTINGUISHED CONTRIBUTORS.

This year's Volume has a unique value, for while the civil side of the Practitioner's work has received every attention as before, it also provides a careful review of the latest achievements in War Surgery and Medicine which cannot be obtained from any other single source. This will be of value to every Practitioner in dealing with such cases, with which he will inevitably be confronted now and in the years to come.

Thus the new "Annual" continues to be a digest of the best modern teaching, culled by experts from the medical literature of the world.

BRISTOL: JOHN WRIGHT & SONS LTD. **LONDON: SIMPKIN, MARSHALL & CO. LTD.**

Baillière, Tindall & Cox

NOW READY. **FOURTH EDITION.**

Pp. xxiv. + 1045. With 42 Illustrations. PRICE **18s.** NET.

MONRO'S MEDICINE

¶ "*Its conciseness, its clearness of statement, its soundness of view, and its universally modern teaching, make it one of the best books of its class in English.*"
—BRITISH MEDICAL JOURNAL.

¶ "*An exposition of medicine that is thoroughly in accord with the best teaching of the present day.*"—THE LANCET.

NOW READY. Royal 8vo. Pp. xii. + 317. With 322 Illustrations. PRICE **15s.** NET.

TINEL'S NERVE WOUNDS

SYMPTOMATOLOGY OF PERIPHERAL NERVE LESIONS CAUSED BY WAR WOUNDS.

By **J. TINEL,** Ancien Chef de Clinique et de Laboratoire de la Salpétrière. With Preface by Professor J. DEJERINE. Revised and edited by **CECIL A. JOLL,** F.R.C.S. Eng., Senior Surgeon, Richmond Military Hospital; late Surgeon-in-Chief, Majestic Hospital, Croix Rouge Francaise.

¶ *One of the surprises of the present war has been the considerable number of peripheral nerve wounds which have been met with, and this work is the only one which in any way fills the gap in the literature dealing with the subject.*

NOW READY. SECOND EDITION. Royal 8vo. Pp. xxii. + 386. With 3 Coloured Plates and 201 other Figures. PRICE **21s.** NET.

LUY'S GONORRHŒA

AND ITS COMPLICATIONS.

Translated and edited by **ARTHUR FOERSTER,** Captain, R.A.M.C., M.R.C.S., L.R.C.P. Lond., late Resident Medical Officer, London Lock Hospital.

¶ "*It seems to us particularly opportune that this very complete text-book on gonorrhœa has appeared in this country at a time when venereal diseases are receiving special attention. ..... We believe this work to be the most complete in our language on its subject. The text is lucid and precise, and the illustrations numerous and helpful. Alike to author, translator, and publisher, we tender our thanks for the production of a most valuable text-book.*"
BRISTOL MEDICO-CHIRURGICAL JOURNAL.

NOW READY. SECOND EDITION. THOROUGHLY REVISED AND ENLARGED.

Pp. xxviii. + 492. With 1 Coloured Plate and 15 Figures. Price **15s.** net.

JUNG'S Analytical Psychology

By **C. G. JUNG,** M.D., LL.D., formerly of the University of Zürich.

Authorised Translation edited by Dr. CONSTANCE E. LONG, Medical Officer, Educational Board, &c.

¶ "*The contents of this book, representing as they do the results of Jung's work over a series of years, form a valuable contribution to the subject, and cannot fail to be of interest to psychologists.*"—PRACTITIONER.

¶ "*The work is one of the most striking and interesting contributions to the literature of the subject which has yet been published in this country.*"—ASYLUM NEWS.

Use a Douglas Motorcycle

WITH a DOUGLAS it is possible to travel along narrow country paths and over loose ground where it would be impossible to drive a car or any other vehicle.

The DOUGLAS is eminently suitable for service in country districts where roads are bad and hills abound. It has an astonishing turn of speed, ample power to meet every emergency, and is so utterly reliable that mechanical trouble is almost unknown.

That is why so many Doctors with country practices are using a DOUGLAS motorcycle. Permits are easily obtained, and we have a limited number of models available.

May we send YOU full particulars?

DOUGLAS BROS., Kingswood, BRISTOL.

Douglas

To the Citizens of Britain—

BURN LESS FUEL!

OWING to the increased demand for Gas for munition works and the unprecedented growth in its use for industrial and domestic purposes—caused partly by the loyal response to the Government appeal to use Gas instead of Coal—the supply of Gas will run short this winter unless in hospital, nursing home, and private houses alike the strictest economy in its use is exercised.

No one should indulge in the comfort of a gas fire in the bedroom except in case of illness.

The use of hot water should be reduced to a minimum.

The number of rooms heated and lighted should be strictly limited.

The utmost economy should be observed in the use of gas for cooking.

Gas should never be left burning a moment longer than is necessary.

The meter should be read regularly so that waste can be promptly detected and stopped.

Everywhere there must be economy if the supply of gas essential for munition works and for other war purposes is to be maintained during the remainder of the war.

COCKING'S ADAPTABLE PORO-PLASTIC JACKETS AND SPLINTS.

INSTRUCTIONS FOR MEASUREMENT.

JACKET.
Circumference at axilla.
" waist.
Circumference at hips. Length from axilla to great trochanter

In severe angular cases, circumference over apex of curve, position of same, and contour should be given; in lateral cases, a description of the case. In all cases it should be stated if for male or female.

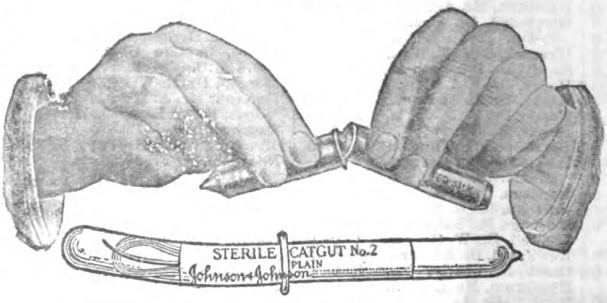
CERVICAL JACKETS. Same measurements required, and circumference at neck, and length from neck to axilla.

Any part of the jacket can in the process of manufacture be made to

LEG SPLINT.
Circumference at top of thigh.
" above knee.
" at knee.
" below knee.
Circumference at calf.
" ankle.
Length splint is required.

State if for right or left leg. When the foot part is required, also circumference at heel and instep, and length from centre of knee to ground. If the limb is contracted the contour should be given.

JACKETS, SPLINTS (in various forms) and PORO-PLASTIC in SHEETS may be had of our Agents.



PATENTEE & SOLE MANUFACTURER — **J. T. COCKING, PLYMOUTH.**

RELIABLE LIGATURES.

In ligature and suture material, there can be nothing better conceived for the sterile and aseptic preparation and conveyance of the same, than a hermetically sealed glass tube. Catgut or silk, as it is prepared in our laboratories must reach the surgeons' hands in absolutely sterile condition.

This is our positive guarantee.

BREAKABLE TUBES.

These Tubes possess advantages known to no other tubes. The perfection of Johnson & Johnson's Laboratory preparation of Ligature and suture material cannot be obtained elsewhere.

Specify
JOHNSON & JOHNSON,
or write for
"HANDBOOK OF LIGATURES" and sample of STERILE CATGUT

Hæmorrhages from Wounds, &c.

FOLLOWING severe hæmorrhage from wounds or other causes, wide experience has illustrated the pronounced value of BOVININE as a blood replenisher. Its use during the present war has so emphasised its expediency in this condition that we confidently invite a trial in the treatment of such cases.

Ready for immediate use BOVININE at once provides a pabulum which fully meets the most exacting medical requirements. It can be given either by mouth or as a

Nutrient Enemata
(Bovinine, 2 oz., Saline Solution, 4 oz.).

This combination yields results far in advance of other rectal feedings.

Write for sample, also for one of our new (sterilizable) Tongue Depressors

On sale at all Chemists and Drug Stores. Price 1/3, 2/9, and 4/6 per bottle.

BOVININE
Established 1878.

J. D. BISHOP, Talbot House, 87, Borough High St., London, S.E. 1.
(Managing Agent for the United Kingdom.)

1867 HAYDEN'S HVC VIBURNUM COMPOUND 1917

In 1867 HAYDEN'S VIRBURNUM COMPOUND was first introduced, and for fifty years it has enjoyed an ever-increasing demand, due to the confidence accorded it by the medical profession for its therapeutic dependability in Gynecological and Obstetrical conditions.

It gains and retains confidence by the results it manifests therapeutically, the only convincing test of the value of a medicinal remedy and upon this basis we invite your consideration.

Accord Hayden's Viburnum Compound a trial in your next Dysmenorrheal patient, and *you will be convinced.* *Dose*: One or two teaspoonfuls three times a day or as required. Administer in three or six teaspoonfuls of hot water.

A supply of the genuine H. V. C., with literature, will be sent you on request.

NEW YORK PHARMACEUTICAL COMPANY
Bedford Springs, Bedford, Mass.

Put up in 4, 10 and 16 oz. bottles
Prescribe in original bottle when possible

HVC HVC

Sole Agents for Gt. Britain: THOS. CHRISTY & CO., 4-12, OLD SWAN LANE, LONDON, E.C.4.

Prescribed by the Medical Profession for 35 years.

The MEDICAL PRESS & CIRCULAR (Lon. Eng.) says: "Few modern improvements in pharmacy have done so much as Benger's preparations to assist the physician in his treatment of the sick."

Benger's Food has been widely used by the Medical Profession for treating—

Diseases of the Stomach and Intestines,
Diseases of the Blood,
Tuberculosis,
Anaemia,
Fevers, and other Infectious Diseases,
After Operations,

and in conditions of Anorexia, Malnutrition, Gastritis, Enteritis, Appendicitis, and in Convalescence generally.

BENGER'S FOOD

for INFANTS, INVALIDS, AND AGED PERSONS,

may be prescribed to give the patient more or less digestive work as the condition indicates. It differs in this respect from preparations where the digestion is complete (predigested foods) and all other foods.

The composition of prepared Benger's Food is variable with the amount used, proportion of milk, or milk and water, upper milk, cream, etc., added, *and the extent of time it stands for self-digestion.* Formulæ and full particulars will be sent to the medical profession post free on application.

BENGER'S FOOD is sold throughout the World by Chemists, &c., in sealed tins.

BENGER'S Food

BENGER'S FOOD LTD., MANCHESTER, Eng.
Branch Offices:——NEW YORK (U.S.A.) 92, WILLIAM STREET.
SYDNEY (N.S.W.) 117, PITT STREET.
Canadian Agents: National Drug & Chemical Co., Ltd., 34, Gabriel Street, MONTREAL, and depôts throughout Canada.

N.B.—BENGER'S FOOD is the direct outcome of the pioneer work on digestive ferments, by the late Sir William Roberts, M.D., F.R.S, and the late Mr. F Baden Benger F.I.C., F.C.S. in 1880, since when it has been the premier dietetic preparation of its kind in the British Empire.

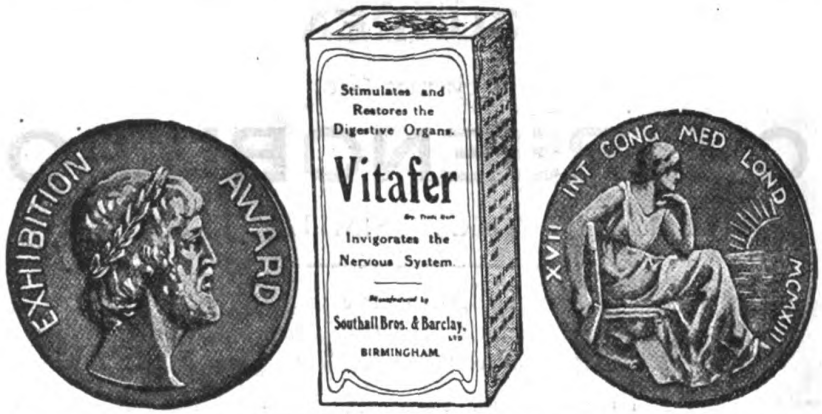
Cyllin Medical—A refined preparation of Cyllin.



Jeysol—Identical in composition with original German Lysol, and equally efficient.

Jeyes' Parasitic Soap—For destroying all body parasites in the trenches.

Jeyes' "Cyllin" Toilet Soap—Invaluable for promoting a healthy skin.

Cyllin Throat Pastilles } Antiseptic.—For all
,, ,, **Lozenges** } Throat Affections.

Jeyes' Sanitary Compounds Co., Ltd., 64, Cannon Street, London, E.C. 4.

VITAFER owes its great success to its perfection as a pharmaceutical Food, and to the recognition by the British medical profession of its superiority.

In pre-war times, Vitafer claimed superiority to existing tonic foods on scientific grounds, and gained a Gold Medal at the International Medical Congress in 1913, in competition with them.

It is as a Scientific Tonic Food that Vitafer has won the approval of the British medical profession. Doctors have prescribed and watched its benefit in tens of thousands of cases.

Vitafer

The All-British Tonic Food

is moderate in price and supreme in value. It gives uniformly successful results.

Sold in Tins by Chemists, price 1/6 and 2/6, larger sizes 4/6 and 7/6

An L.R.C.P. writes: "Your VITAFER Food Tonic is a much needed preparation in these days of nerve strain and worry, replacing the pre-war preparations, than which it is more agreeable to take. I have both pleasure and confidence in recommending this preparation when needed."

Sole Manufacturers:
SOUTHALL BROS. & BARCLAY Ltd., Lower Priory, BIRMINGHAM.

Science Offers You Her Latest Triumph

THE manufacture of synthetic organic drugs by skilled chemists enables the general practitioner interested in the scientific aspects of medicine to keep fully abreast of recent medical practice. In addition to being able to supply immediately all the new antiseptics investigated by Dakin and his colleagues in their remarkable researches, BOOTS PURE DRUG COMPANY LIMITED have pleasure in announcing the issue of a valuable new antiseptic preparation which they have recently perfected—

CHLORAMINE-T CREAM

Containing approximately 1 per cent. Chloramine-T. Described and investigated under the name of Chloramine Paste by Vincent Daufresne, Carrel, Hartmann and others, in the Journal of Experimental Medicine, 1917.

CHLORAMINE-T CREAM cleans and sterilises infected wounds, and maintains an aseptic condition once it is established: it has no retarding effect upon the speed of healing of wounds. CHLORAMINE-T CREAM is invaluable as a *safe and efficient curative toilet cream, and as a first dressing which may be relied upon to disinfect with certainty* wounds, cuts, and abrasions, whether light or severe, and in all similar cases of emergency.

IN POTS. TRIAL SIZE 9d. LARGE SIZE 2/6.

Head Offices
Station Street - NOTTINGHAM.

Chloramine-T and Chloramine-T Cream are manufactured by
BOOTS PURE DRUG COMPANY LIMITED,
Manufacturing Chemists and Makers of Fine Chemicals.

JESSE BOOT,
Managing Director.

'Pepsencia'

PEPSENCIA is an ever-ready digestive fluid, containing all the soluble constituents of the gastric juice, preserved in an agreeable aromatic menstruum. It represents both the peptic and milk curdling ferments obtained directly from the fresh peptic glands.

PEPSENCIA is acceptable to the most delicate and fastidious patient, while it excels all other allied preparations in activity and utility.

One teaspoonful before or after a meal will be found of service in all cases where pepsin is indicated.

Supplied to the Medical Profession in 4 oz., 8 oz. and 16 oz. bottles at 2/4, 4/2 and 7/8 each, and Winchester Quarts at 33/- each.

Peptogenic Milk Powder

Cows' milk prepared with PEPTOGENIC MILK POWDER becomes remarkably like mothers' milk in all particulars: in physical properties, in colour and taste, and in the percentage of nutritive constituents: in its digestibility, its behaviour with acid, with rennet, and in the infant's stomach.

Milk prepared with the PEPTOGENIC POWDER has simply the normal digestibility of mothers' milk: is not too easily or unnaturally digestible, and contains no aid to digestion. It affords a complete substitute for mothers' milk during the entire nursing period.

Supplied to the Medical Profession in two sizes, at 2/4 and 4/8 each.

Specimens and literature will be forwarded on request.

Originated and Manufactured by

Fairchild Bros. & Foster,

NEW YORK.

Agents for Europe, Asia, Africa, and Australasia:

Urodonal

37 TIMES MORE POWERFUL THAN LITHIA.

Dissolves Uric Acid, Oxalic Acid, and Xantho-Uric Bodies,

Oxidises Cholesterin, Glucose, & Fats,

Eliminates Urea and Chlorides,
and
Restores Arterial Tension to Normal

Uric Acid Crystals.

3 teaspoonfuls per day, each teaspoonful in a glass of water, taken between meals. Acute conditions: 3 tablespoonfuls per day. No Contra-indication, and may be continued indefinitely without any inconvenience.

Oxalic Acid Crystals.

GOLD MEDAL, LONDON, 1908
Grand Prix, Nancy and Quito, 1909
Hors Concours, San Francisco Exhibition, 1915

COMMUNICATIONS:
Academy of Medicine, Paris, 10th Nov., 1908.
Academy of Sciences, Paris, 14th Dec., 1908.

URIC ACID is never found free in the organism. It always exists in a state of combination with Soda, Ammonia, &c.; it forms biurates or quadriurates, which are complex and not easily soluble.

URODONAL by reason of its special composition, is able to effect the double chemical decompositions which liberate the Uric Acid from the combinations where it is fixed, and cause it to be easily eliminated in the urine.

URODONAL is a most powerful solvent of **URIC ACID,** because it can destroy its organic combinations.

URODONAL.—Price 5/- and 12/- per bottle.
Prepared exclusively at CHATELAIN'S Laboratories, 2 & 2 bis, rue de Valenciennes, Paris.
Can be obtained from all Chemists and Stores, or direct from the Sole British and Colonial Agents—

Trial Supplies and Full Descriptive Literature sent on application to **HEPPELLS** *at the above Address.*

SUBITOL

(The product of an Allied Country)

HAS USEFULLY and EFFICIENTLY REPLACED

ICHTHYOL

THE attention of surgeons is directed to the excellent results which have been obtained in the treatment of septic wounds with Ichthyol and glycerine. Dressings do not need changing so frequently, and thus not only is the disturbance to the patient lessened, but valuable time is saved. Even the most septic wounds have been found to respond readily to the above treatment.

Ichthyol being an enemy product

SUBITOL

has been substituted, and has already been found to give equally good results.

The therapeutic efficiency and usefulness of Ichthyol in the treatment of Gastro-Intestinal Affections, Vesical Catarrh, Endometritis, Eczema, Erythema, Hæmorrhoids, Acute and Chronic Arthritis is sustained when **SUBITOL** is prescribed instead of Ichthyol.

SAMPLE AND PAMPHLET SENT FREE.

Prices: 4 ozs., 2/-; 8 ozs., 3/6; 1 lb., 5/6; also in larger containers for Hospital use.

SUBITOL *can be had from leading Pharmacists, or direct from—*

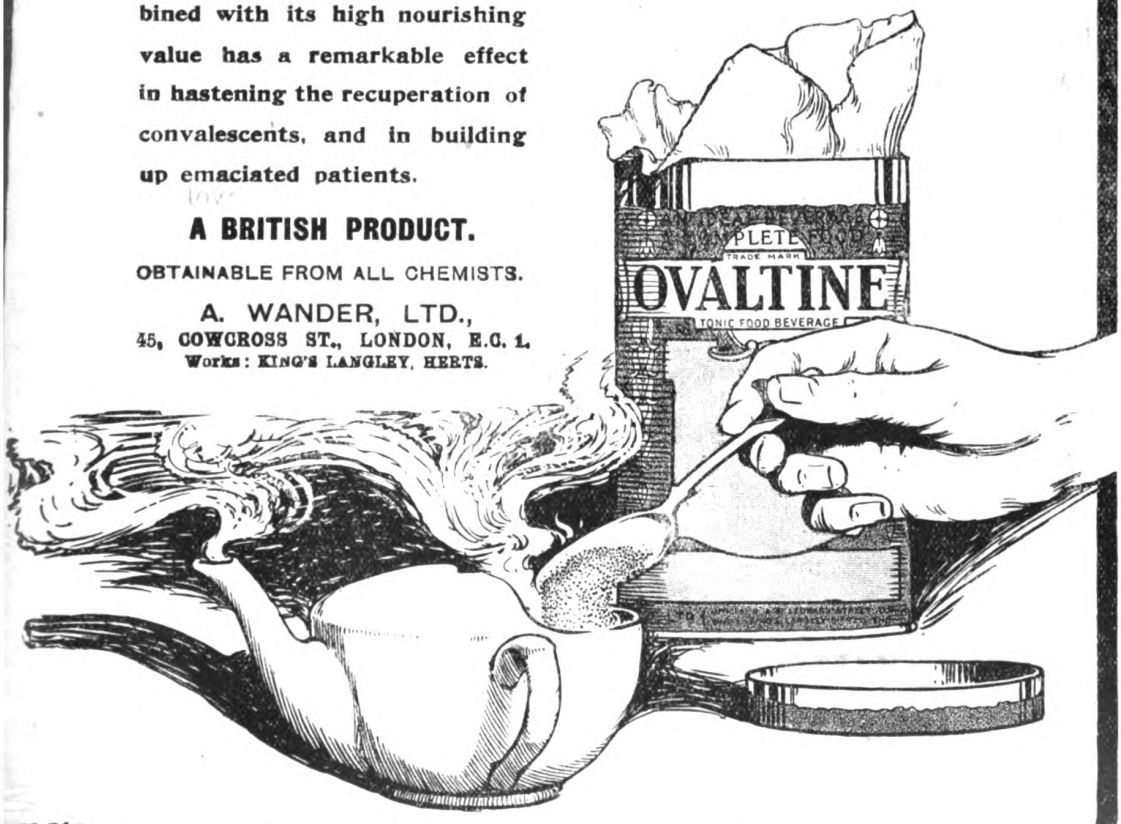
BRITISH FIRM.

OVALTINE

TONIC FOOD BEVERAGE

IN THE SICK ROOM.



The ease of preparation of "Ovaltine" is an obvious advantage. The granules on being dropped into hot milk dissolve in a few seconds. Troublesome and tedious cooking processes are thus avoided.

A cup of "Ovaltine" contains as much nourishment as three eggs, and is digested and absorbed with the minimum of strain to the digestive functions. Its flavour is always acceptable even to the most fastidious and during prolonged courses. "Ovaltine" is distinguished from ordinary invalid foods in being unusually rich in organic phosphorus compounds. This combined with its high nourishing value has a remarkable effect in hastening the recuperation of convalescents, and in building up emaciated patients.

A BRITISH PRODUCT.

OBTAINABLE FROM ALL CHEMISTS.

A. WANDER, LTD.,
45, COWCROSS ST., LONDON, E.C. 1.
Works: KING'S LANGLEY, HERTS.

M 51A.

AN EFFECTIVE MEANS OF ALLEVIATING COUGH.

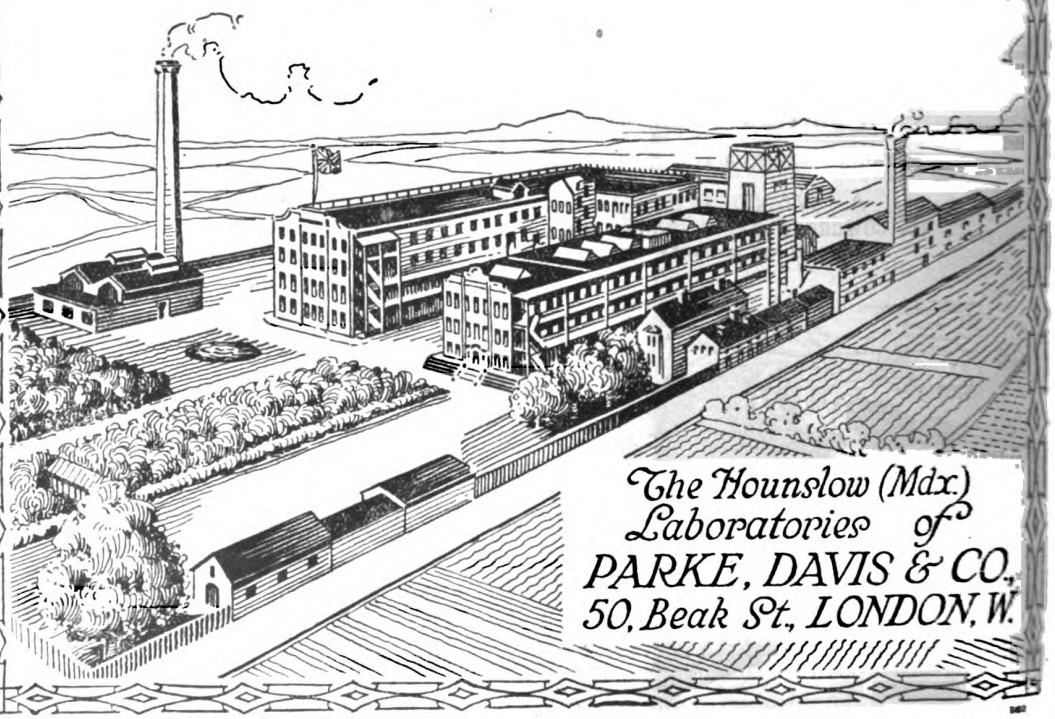
SYRUP COCILLANA COMPOUND (P., D. & Co.) possesses therapeutic properties distinct from those of any preparation hitherto available for the relief of bronchial affections.

SYRUP COCILLANA COMPOUND (P., D. & Co.) renders most efficient service in cases of hard dry cough with scanty expectoration. It soothes the inflamed mucous membrane, promotes dislodgement of indurated mucus, restores tone to the bronchi, and relieves dyspnœa. The small dose of cascarin (the tonic-laxative principle of cascara sagrada) promotes the regular action of the bowels which is particularly desirable in catarrhal conditions of the respiratory tract.

SYRUP COCILLANA COMPOUND (P., D. & Co.) is specially prepared for Prescribing by Physicians.

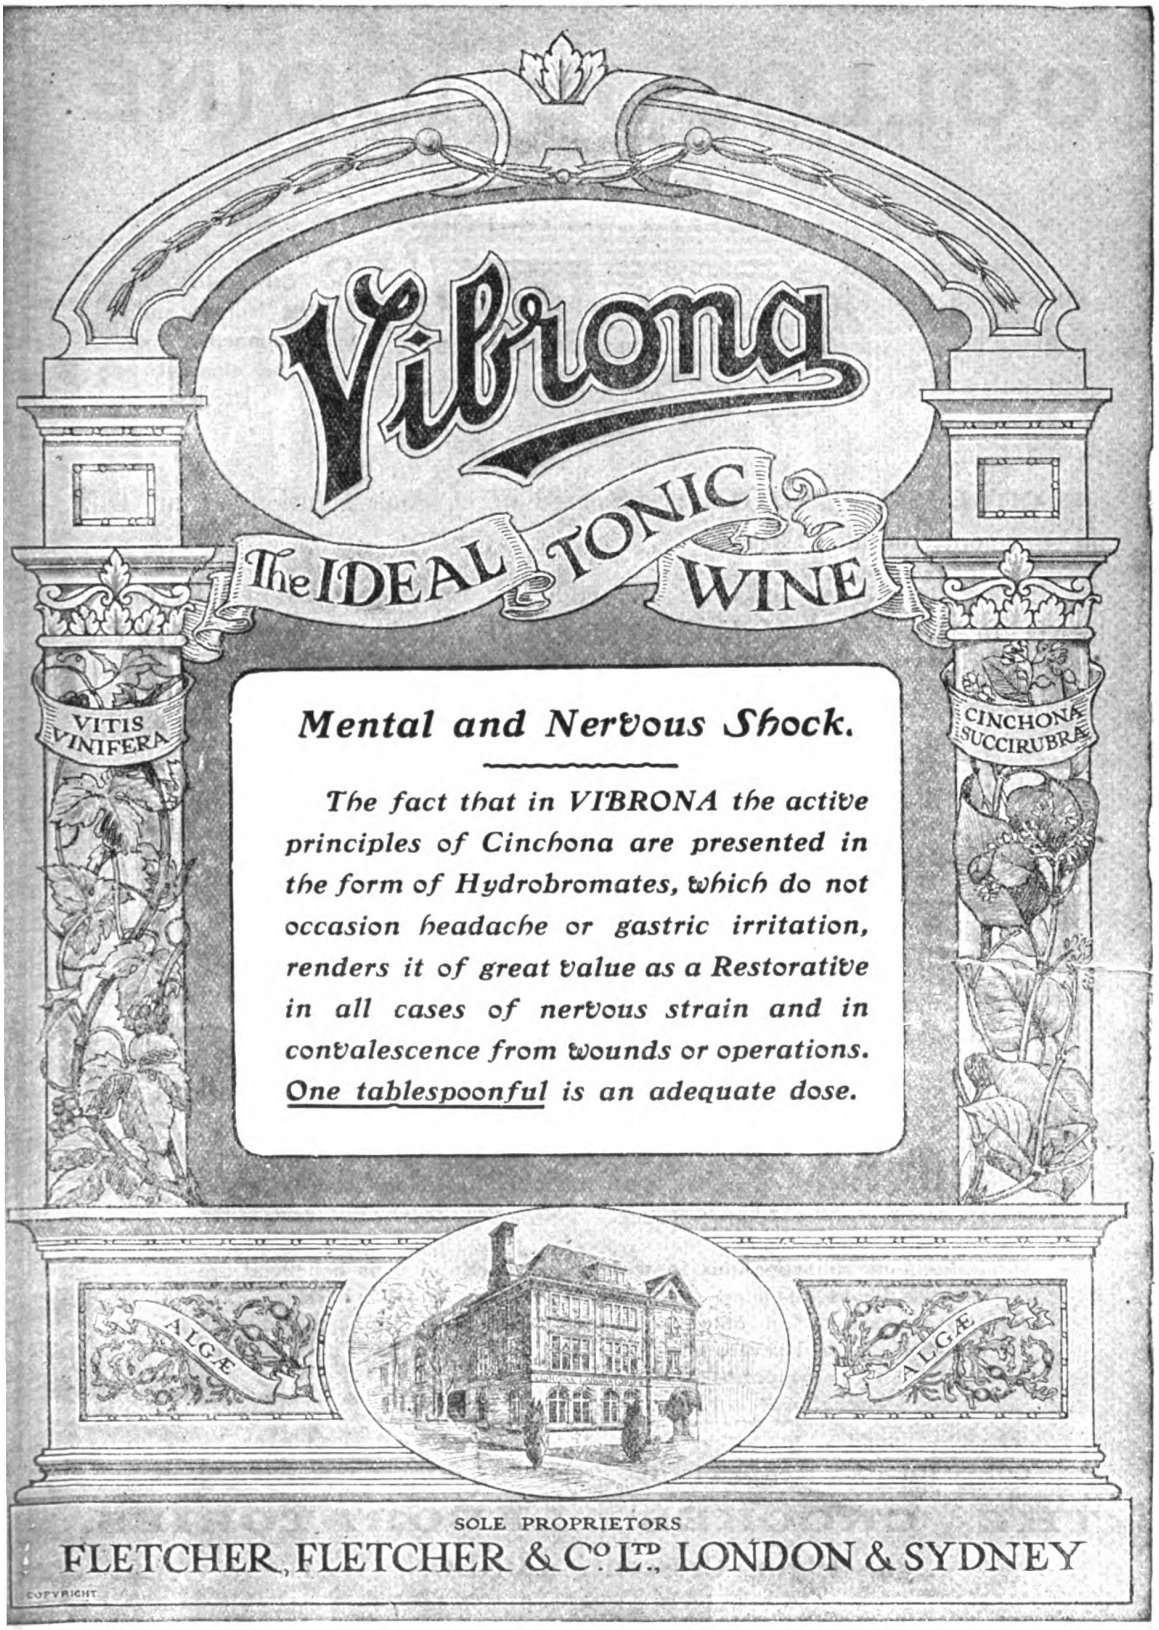
The precise formula is published.

The Syrup is not advertised to the public. Its name on the prescription does not convey any meaning to the patient.



Syrup Cocillana Compound is supplied in bottles of 4, 8 & 16 fl. ounces. Please specify "P., D. & Co."

EACH FLUID DRACHM CONTAINS:



Tincture of Cocillana	5 minims.
Tincture of Euphorbia Pilulifera	15 minims.
Syrup of Wild Lettuce	15 minims.
Compound Syrup of Squill, U.S.P.	3 minims.
Cascarin (P., D. & Co.)	1 grain.
Heroin Hydrochloride	1/24 grain.
Menthol	1/100 grain.

DOSE.—One-half to one fluid drachm.

NOTE. — COCILLANA BARK (*Guarea Rusbyi*) is a South American drug which we were the first to bring before the medical profession. It has been found equal to ipecacuanha in expectorant properties and to possess, in addition, a tonic and laxative action. Euphorbia has a well-deserved reputation for the alleviation of subacute and chronic inflammations of the respiratory tract. Wild Lettuce (the source of lactucarium) possesses sedative and antispasmodic properties akin to those of opium, but it does not interfere with the secretory or digestive functions.

The Hounslow (Mdx.) Laboratories of PARKE, DAVIS & CO., 50, Beak St., LONDON, W.

Vibrona
The IDEAL TONIC WINE
VITIS VINIFERA
CINCHONA SUCCIRUBRA
Mental and Nervous Shock.
The fact that in VIBRONA the active principles of Cinchona are presented in the form of Hydrobromates, which do not occasion headache or gastric irritation, renders it of great value as a Restorative in all cases of nervous strain and in convalescence from wounds or operations. One tablespoonful is an adequate dose.

COLLOSOL IODINE

CROOKES'

COLLOSOLS are Drugs in the COLLOID STATE.

COLLOSOLS are isotonic and isomorphic with the elements of the body.

COLLOSOL IODINE is prepared in aqueous solution, as an Oil, an Ointment, and as a Pasta.

The following extract from an article by one of the foremost dermatologists, in the *British Medical Journal* of May 12th, 1917, testifies to the efficacy of **COLLOSOL IODINE OIL** in the treatment of

CHILBLAINS.

"In a severe case of chilblains in the first stage, that of a woman of 37, whose fingers were so swollen that they looked like sausages, under the application of Collosol Iodine Oil rubbed in four or five times a day every trace of the condition disappeared in four days."

COLLOSOL SULPHUR

Prepared for Internal administration, as an Ointment, and for use in Sulphur baths. Indicated in **RHEUMATIC** conditions and **SKIN** affections.

The above-quoted medical authority, in the same issue of the *British Medical Journal*, stated :—

"Among the affections in which Collosol Sulphur is beneficial are various forms of acne, including acne rosacea and seborrhœa. ..... In the case of an officer from the front, who was crippled with fibrositis and had severe eczema, a daily Collosol Sulphur bath relieved him of all his symptoms in a week."

COLLOSOLS are prepared for the Proprietors, Crookes' Collosols Ltd., at

THE CROOKES' LABORATORIES,

50, Elgin Crescent, LONDON, W. 11.

An Advance in Lecithin Administration

'Byno' Lecithin

A VALUABLE TONIC NERVE FOOD

'BYNIN' LIQUID MALT

'BYNIN' AMARA

'BYNIN' EMULSION

'BYNOL' THE 'ALLENBURYS' MALT AND OIL

'BYNO' CASCADA

'BYNO' GLYCEROPHOSPHATES

'BYNO' HYPOPHOSPHITES

"BYNO" LECITHIN presents Lecithin in combination with "Bynin," pure active liquid malt, together with the Alkaloids of Cinchona and Nux Vomica. The advantages claimed for this product are **therapeutic efficiency, palatability and ease of assimilation.**

"BYNO" LECITHIN is at once a digestive, a tonic and a food; it exerts a stimulating and reconstructive action on the enfeebled nervous system, and greatly improves general nutrition.

Each ounce of "Byno" Lecithin contains 4 grains of Lecithin.

In bottles **at 2/6, 4/6 and 8/6 each.**

Rich in Diastase.

Maltine

Rich in Phosphates and Proteids.

The BRITISH MEDICAL JOURNAL says:—

"Clinical experience enables us to recommend it ('MALTINE') as a nutritive and digestive agent, in virtue of its albuminoid content and its richness in phosphates and diastase."

THE LANCET says:—

"'MALTINE' exhibits in an eminent degree the starch-dissolving power of diastase; in fact, a teaspoonful is capable of converting instantaneously a surprising amount of stiff starch paste into a thin limpid liquid."

"**MALTINE**" is readily distinguished from other extracts of malt by its agreeable flavour, convenient consistence, and attractive colour. Its **diastasic** strength, richness in reconstructive constituents, and easy assimilability are the **facts** which explain its use by medical men.

INDICATIONS:

(1) As a nutrient in feeble nutrition and wasting disease.

(2) As a starch digestant to aid feeble amylaceous digestion.

(3) In fever and milk diets, to supplement nutrition and to prevent coarse curdling.

(4) In Infant Feeding, to humanize cow's milk.

(5) As a vehicle and emulsifying agent.

(6) As a natural counteractant to constipation in infants and children.

(7) As a galactagogue.

The word "MALTINE" is our Trade Mark. In prescribing, kindly specify "MALTINE COMPANY."

THE MALTINE MANUFACTURING CO., Ltd., 183, Acton Vale, London, W. 3,

Will be pleased to send Specimens Free of Charge to Medical Men.

"DRY PEPTONOIDS" SOLUBLE (Carnrick & Co.)

BEEF, WHEAT, and MILK

PRE-DIGESTED by ENZYMES.

THE LANCET reports, November 27th, 1915:—

"The pre-digestion is evidently complete, inasmuch as 'Dry Peptonoids' dissolve to a practically clear solution even in cold water. The taste is attractive, a malt flavour being more in evidence than anything else. Our analysis gave the following results: Moisture, 5·00 per cent.; mineral matter, 8·2 per cent.; proteins, 38·80 per cent.; and total sugars, 48·00 per cent. The preparation is one of distinct merit, and should serve as a rapid nutrient, especially in cases of digestion enfeebled by illness."

"LIQUID PEPTONOIDS" is a palatable solution of the same food principles —Beef, Milk, and Wheat Pre-digested—that constitute "DRY PEPTONOIDS."

CARNRICK & CO., Limited, 183, Acton Vale, London, W. 3,

Will be pleased to send Samples Free of Charge to Medical Men.

COMBATS SERIES, 173—SIAMESE

To combat the Season's Epidemics

TRADE MARK **'WELLCOME'** BRAND

Concentrated Diphtheria Antitoxin

Each c.c. contains at least 1000 units. Doses of many thousands of units are therefore easily injected and absorbed.

Supplied in hermetically-sealed phials as follow: 1000 units, 2/0; 2000, 3/6; 3000, 5/0; 4000, 6/0; 5000, 7/0; 6000, 8/0; and 8000, 10/0 per phial

TRADE MARK **'WELLCOME'** BRAND

Anti-meningococcus Serum

Contains a high anti-body titre when tested against all the recognised types of meningococci and parameningococci.

SUGGESTED DOSAGE.—
20 to 25 c.c. intrathecally.

Supplied in phials of 25 c.c. at 6/6 each

Reproduction of a fresco illustrating an ancient Siamese-Cambodian historical legend. The two sons of a deposed King determined to dethrone the usurper. They sent an ultimatum and the proposal was made that, in order to avoid great bloodshed, the two Kings themselves with their body-guards, should fight it out in an elephant combat. In the scene here depicted, the son of the late rightful sovereign has just struck off the crowned head of the usurper while his elephant has thrust his tusks into the throat of that of his adversary. Date, the Middle Ages.

TRADE MARK **'WELLCOME'** BRAND

Influenza Vaccine

For treatment, when the *Bacillus influenzæ* has been detected.

SUGGESTED DOSAGE.—A suitable initial dose is 10 million organisms, which may be increased if necessary.

Two strengths—10 million and 50 million B. influenzæ in each c.c. Either strength in phials of 1 c.c., 3/0 each; bottles of 25 c.c., 30/0 each

TRADE MARK **'WELLCOME'** BRAND

Coryza Vaccines

SUGGESTED DOSAGE

Prophylactic—100 to 200 million organisms of a Vaccine containing a number of different organisms. This dose may be doubled a week later.

Therapeutic—100 million organisms of the Vaccine which contains the organisms most abundantly present in smear or culture. 200 million may be given a week later.

No. 1, containing 100 million *B. septus* in each c.c.

No. 2, containing 100 million *M. catarrhalis* in each c.c.

No. 3, containing 100 million each of *B. septus* and *M. catarrhalis* in each c.c.

No. 4, containing 50 million each of *B. septus*, *B. Hoffman*, *B. Friedländer*, *M. catarrhalis* and Staphylococcus, mixed; and 10 million each of Pneumococcus and Streptococcus, mixed, in each c.c.

Phials of 1 c.c., 2/6 each; bottles of 25 c.c., 25/0 each

ELECTRARGOL

Electric Colloidal Silver in Minute Ultramicroscopic Particles, the Solution being Sterile and Stable.

Electrargol offers the following advantages over the colloidal silver prepared by chemical means: Extreme minuteness of the particles and a degree of activity which is always equal. Absolute purity. Maximum catalytic power and activity, whether physiological or therapeutic.

For hypodermic injection.
Boxes of 6 tubes of 5 c.c.
Boxes of 3 tubes of 10 c.c.
For surgical use—Bottles of 50 and 100 c.c.

THERAPEUTICAL INDICATIONS:

All infectious diseases and in particular

Pneumonia, Bronchopneumonia, Typhoid, Typhus, Tetanus, Measles, Variola, Septicæmia, Scarlatina, Cholera, Erysipelas, Malta Fever, Acute Meningitis, &c.

LOCAL APPLICATIONS:

Septic Infections of Wounds, Mammary Abscess, Epididymitis, Orchitis, Whitlow, Furunculosis.

ENESOL

SALICYLARSINATE of MERCURY.

AN IDEAL COMPOUND for Combined ARSENO-MERCURIAL TREATMENT OF SYPHILIS.

Superior to all others on account of:

1. **Its slight Toxicity,** rendering possible the administration of comparatively large doses of mercury and arsenic without setting up intolerance.
2. **Injections Painless** even in full doses. Never causes induration.
3. **Double specific action** (mercurial and arsenical).
4. **Pharmacology and Doses.—Tubes of 2 c.c. and 5 c.c.,** containing 3 cgr. (0·46 grain) per c.c. solution. **Medium Dose.**—Intramuscular injections of 2 c.c., corresponding to 6 cgr. (0·92 grain) of **Enesol** per day. Should be injected by preference in the gluteal region.

Large doses or saturated solutions.—Intramuscular injections of 4 to 6 c.c. corresponding to 12 to 18 cgr. (1·85 to 2·77 grains) of **Enesol** every two or three days. Intravenous injections of 2 c.c. to 10 c.c., corresponding to 6 to 30 cgr. (0·92 to 4·63 grains) of **Enesol,** according to the subject, urgency, and gravity of the case, every two or three days.

Sold only in Boxes of 10 tubes of 2 c.c. each and 6 tubes of 5 c.c. each.

The above Preparations have been authorized by the **FRENCH** Ministries for use in the

NAVAL AND MILITARY HOSPITALS.

Employed by leading English and French Physicians and Surgeons.

NOURRY'S WINE

(Iodinated).

0·77 gr. of Iodine and 1·54 gr. of Tannin per tablespoonful.

THIS THOROUGHLY RELIABLE

and uniform preparation is prescribed by the most eminent British and Continental Physicians in cases of

LYMPHÆMIA, ANÆMIA, DYSMENORRHŒA, PULMONARY AFFECTIONS.

Children—One to two teaspoonfuls. Adults—One tablespoonful. To be taken at meals twice a day.

Free from Alkaline Iodides. Palatable. Easily assimilated. A perfect substitute for Cod Liver Oil and Iodides.

For Reports see "BRITISH MEDICAL JOURNAL," January 12th, 1895; August 29th, 1896; "LANCET," January 6th, 1894; March 30th, 1901, and various other medical publications.

NOURRY'S WINE is NOT advertised to the public.

CACODYLATE OF SODIUM (CLIN)

(Organic Arsenic).

Emphatically recommended by Professors GAUTIER, RENAUT, LETULLE, &c., in the treatment of

TUBERCULOSIS (either incipient or declared),

IMPALUDISM, DIABETES,

DERMATOSES and **CANCER.**

DROPS.—5 drops contain ¼ grain of Pure Cacodylate of Sodium.

GLOBULES.—This special form consists of little Globules, easy to swallow, with a shell of gluten. Each Globule contains ¼ grain of Pure Cacodylate of Sodium.

TUBES (Sterilised for Hypodermic Injection).—Each Tube contains a sterilised solution dosed at ½ grain of Pure Cacodylate of Sodium per injection of 16 minims.

CLIN LABORATORIES — PARIS.

Experiences IN COLONY TREATMENT AND AFTER-CARE.

By G. SIMS WOODHEAD, V.D., M.A., M.D., LL.D.,

BREVET COLONEL, A.M.S.; FELLOW OF TRINITY HALL AND PROFESSOR OF PATHOLOGY, UNIVERSITY OF CAMBRIDGE;

AND

P. C. VARRIER-JONES, M.A., M.R.C.S., L.R.C.P. LOND.,

FOUNDATION SCHOLAR, ST. JOHN'S COLLEGE, CAMBRIDGE; HONORARY MEDICAL OFFICER, CAMBRIDGESHIRE TUBERCULOSIS COLONY, AND ACTING TUBERCULOSIS OFFICER FOR THE COUNTY OF CAMBRIDGE.

THE Cambridgeshire Scheme of After-Care having been in operation in its experimental or its completed form for a matter of two years, we have been urged to put together the experiences that have been gathered and some of the results that have accrued from its application in the area concerned.

RESULTS OF SANATORIUM TREATMENT.

Sanatorium treatment is at the present time on its trial. Insurance Committees all over the country have followed up with critical eyes many of the cases that have received treatment at various sanatoria. A few counties have their own sanatoria, and have been able to observe the results obtained from a patient's stay at such an institution for a matter of three months or so. It is only comparatively recently, however, that sanatorium treatment has been available for the working man of this country, and it is obvious that the results are not what we were led to expect. It is stated on very good authority that the results of sanatorium treatment vary according to the class of person treated, and that amongst the well-to-do the results of treatment are three times as good as are those obtained with the working man. Taken as a whole, then, it may be asserted with confidence that sanatorium treatment for the well-to-do is, and has been, a marked success, but that when applied to the working man the results have fallen far short of expectations.

We have therefore to consider the different factors which influence these results and profit, if we can, from the experiences of various sanatoria, especially those that have observed for some considerable time the records of their patients after they have received and followed up treatment. It is evident that the mode of life continued by the patient after he has received sanatorium treatment is of paramount importance. It is clear, moreover, that another important factor in the result is the length of time that has been devoted to that treatment; whilst it is evident that the unfavourable results which have been observed as following the treatment of the working man are due, in great measure, to the strict limitations of time which have been imposed by various Insurance Committees on the length of institutional treatment.

It would seem that the method of procedure had been somewhat as follows. A patient is selected for sanatorium treatment. Very often the disease is well marked, but notwithstanding this unfavourable feature the length of treatment is seldom, if ever, increased, but is strictly limited to the regulation period of three months. There can be no doubt that such a method of procedure is practically useless. This is self-evident when it is remembered that the man is now compelled to return to the surroundings in which he contracted the disease and is given little or no opportunity to carry out treatment which he obtained as a matter of routine at the sanatorium. It is obviously useless to instruct such a patient to "carry on" the mode of life which for three months he has been obliged to live, when in all probability he has now to return to a crowded street in which fresh air and sunshine are extremely limited and the food-supply absolutely inadequate.

The first consideration, therefore, before condemning sanatorium treatment as utterly worthless is, Is it practicable extend the length of the institutional treatment? It is clearly impossible, without unlimited funds at our disposal, to prolong sanatorium treatment as at present carried out. The expenditure of money on buildings would be enormous, and buildings, to say the least, can contribute but an infinitesimal amount to the real treatment of the disease. The essentials of successful sanatorium treatment have been demonstrated, repeatedly, to be of the simplest character, and for cases which are at all suitable for such treatment it is useless to expend money on bricks and mortar, glazed tiles, and parquetry floors, when all that is required is adequate shelter from inclement weather and the opportunity for the patient to engage in interesting and instructive work.

Causes of Failure.

Undoubtedly one of the great causes of the failure of our present plan of sanatorium treatment is the manner in which it is carried out. It cannot be gainsaid that the medical profession has been far too timid in the application of the principle of "work" in the treatment of the consumptive working man. The oft-repeated injunction that the man must be extremely careful, must avoid any exertion, and must keep himself in a state of perpetual fear of a sudden hæmorrhage has been carried to great extremes.

Again, it is obvious that if we desire to avail ourselves of the educational facilities of a sanatorium, we defeat our own ends when we erect elaborate buildings and equip and fit them up on the present lavish scale. A patient will quickly succumb to the idea that his "cure" is more a matter of architecture than the provision of fresh air, graduated work, and an adequate food-supply. It must be the experience of many medical men who have sent patients to sanatoria that on their return they have lost the moral courage to make a fresh start amid surroundings which, not really unhealthy, require but little adaptation and the necessary courage to be made entirely suitable for the reception of patients in whom the disease has been arrested.

Again, an institution in which the working man is educated to imagine that a life of ease is the one which he must hereafter enjoy is morally bad for the patient, in addition to which it involves a distinct loss to the general community to which he has to return and in which he will have to live and ought to work.

The patient returning home is thoroughly dissatisfied with his surroundings and refuses to make the effort which, in the interest of the man himself, it is of prime importance he should make. If this dissatisfaction led to a keen desire to improve his condition and that of his neighbours, much good might come of it, but as a rule the desire does not take this direction. It induces rather a feeling of depression, and the patient regrets that he is unable to enjoy the good things with which he was surrounded at the sanatorium, and without which, he has become convinced, his cure cannot be effected or completed, and it is with no feeling of encouragement that he attempts to restart his former mode of life. The gulf fixed is too great, and he realises, or believes that he realises, that without an adequate income he is powerless to start any system of reform.

To what authority can he possibly turn for help? A self-respecting man scorns the helping hand of charity, and in how many places in England and Wales can a consumptive be provided with a model cottage and suitable work to which to turn? There seems to be no single authority in the Kingdom by which these arrangements are made. Indeed, the greatest efforts put forth, so far, are those of After-Care Associations, which offer small doles of food or money to enable the man to return to some out-of-door occupation at which the wages earned are miserably low and the labour market extremely limited.

When we come to review the possible occupations for ex-sanatorium patients, it must be confessed that they are few in number, and that they are limited still more in that the number of employers who are willing to accept the services of an ex-sanatorium patient are few and far between, and will remain few until they become properly educated in this matter. An ex-patient then, having for three months tasted the joys of an open-air life surrounded by every care, receiving every attention, with every comfort ministered to, with little to do and supplied with adequate food, unfailingly despairs when he has to return to his own home and start afresh what he believes will be a losing struggle.

Direction of Treatment along Industrial Lines.

From all this it is clear that before sanatorium treatment is condemned in its entirety, some effort should be made to correct faults which obviously detract from its value. Taking into consideration these various factors the first line on which to make an advance is to alter, radically, sanatorium treatment and endeavour to direct it along industrial lines. If the treatment can be prolonged in such a way that the patient can be made to realise that he can work satisfactorily for a certain number of hours per day we shall have overcome one of the greatest obstacles to effectiveness that at present bars our way to further progress.

There are two ways in which this can be done. One is to prolong the actual treatment at the sanatorium, and the other is to provide suitable accommodation and give the working man an equal opportunity of carrying on the treatment in his own home: an opportunity enjoyed by his more fortunate rich neighbour.

It must be borne in mind, however, that if the treatment is to be prolonged in an institution it should be more carefully modelled on *lines* of useful and remunerative work. The working man objects very strongly—and naturally—to useless labour, which is not only useless but irksome, savouring of the treadmill rather than of the tonic.

He is quite ready to admit that labour is a necessary part of his treatment, but he is also ready to dispense with that form of treatment at the first available opportunity. Patients will readily, and with avidity, swallow gallons of obnoxious fluid in the form of medicine, but the appetite for irksome toil soon becomes nauseated. What is the remedy? Substitute for meaningless labour work in which the patients can take a keen interest. Stimulate them to take an actively intelligent interest in the task in hand, and as their working capacity becomes gradually restored let the patients receive a wage for the labour of their hands.

The problem of remunerative work both inside and outside an institution is one of the most difficult with which we have to deal and one not lightly to be discussed or put aside. On the one hand, however anxious one may be to stimulate the interest of the patient in the task he has to perform (and although the performance of that task is directly and distinctly for his own benefit) it must be borne in mind that various cracks soon become apparent whereby the man's labour may appear to leak into the gulf of exploitation. It is sometimes, nay frequently, felt by the working man when he is called upon to perform various sanatorium tasks that, willy-nilly, he is being imposed upon, that the labour is not only not for his particular benefit but is being exploited by the institution as a means of obtaining free labour. That certain working men have these ideas there can be little doubt, but we cannot accept it that they are those of working men, who have enjoyed the advantage of treatment at a sanatorium, as a class. Nevertheless, if such a feeling exists, it will soon spread, and its extension will seriously prejudice the good to be achieved by such institutions. It is our duty as far as possible to remove these erroneous ideas, and it is necessary for us to place ourselves in the position of these patients and look at the problem from their point of view.

In our work we immediately came into collision not only with a friendly society rule but also with the law, which states that no man may be in receipt of sick-pay whilst he is engaged in remunerative work. In Cambridgeshire, however, we have been fortunate in the formation of the After-Care Association through the action of which this apparently almost insuperable difficulty has been overcome, so that the road is now clear for the reformation of institutional treatment on colony lines.

THE PROBLEM AS VIEWED BY THE WORKING MAN.

In order to obtain light on the outlook of the working man on some of the above points it has been the practice to give to each patient coming into the Bourn Colony a set of questions with a request that he will answer them as fully and as frankly as he can, the object being to obtain a picture of the man's state of mind and to gain some idea of how the problem presents itself to him. Here are reproduced two sets of answers from patients having widely different outlooks on life. One of these men was an ex-employee of a large Glasgow firm of engineers, the other a traveller for a firm of engineers. The answers are here given exactly as put down, and are instructive as showing how clearly the difficulties of the problem of after-care is grasped by the "working man."

Views of an Engineer.

Question 1: Would you be prepared to accept a situation in the country after your treatment at the colony has come to an end?—Answer: If strongly advised by the doctor, yes.

If the country is more suitable than the town for the ex-patient it follows that in the majority of cases the patient would accept with good grace the inevitable, although to do so strong prejudices might have to be overcome; but in answer to—

Question 2: What conditions of employment would you consider satisfactory?—Answer: Suitable employment must be found, and the question arises: Can sufficient employment be found of a suitable nature for the number of people suffering from tuberculosis? This must not be taken as want of faith in the doctor.

To make it quite clear take my own case. Up to the commencement of my illness I was in the regular employment of Messrs. Barr and Stroud, Glasgow, at whose shops the conditions are far in advance of any engineering firm in the U.K. Good wages were paid, and the writer was given 1*s.* per hour for a 50-hour week; all time over this was paid for at the rate of 1*s.* 6*d.* Engaged as a tool maker, I was eventually given the position of a brading hand on a milling machine. The wages of the brading hands have been advanced during the last nine months.

As this shop is in a large city returning to it is out of the question. Would a man who has been used to good working conditions with fairly good pay accept a job in the country—say light work on a farm at 18*s.* a week with cottage? I think not.

A mechanic might be advised to take up motor-driving, but how many people realise that to pay a mechanic 40*s.* a week with a cottage is cheaper in the long run than a handy man at 25*s.*?

The writer would require a situation with regular hours, one half day a week, no Sunday work, with fairly good pay, and some prospects of advancement.

A situation hard to find. Then what work is there for this class of tuberculosis patient? I do not know; therefore it is impossible for me to answer the question of working conditions.

Question 3: Would you desire a temporary or a permanent situation?—Answer: Permanent. Age is a large factor which enters into the choice between a temporary and permanent situation. A married man or one with the intention of being married finds it undesirable to keep changing his mode of living and the manner of getting that living. Again, of what use is a temporary situation to an ex-patient? As soon as that employment ceases he is again looking for another job, and in the meantime what is to become of him? His resources, if any, would soon be at an end, and in a very short time his position is worse than before the commencement of his treatment.

Question 4: If not, state the reasons which influence your decision?—Answer: Not applicable.

Question 5: If a situation were found for you (at your own particular job) and you were in close touch with the Colony or similar institution, what conditions of employment would you consider satisfactory?—Answer: Were the treatment to last for a long period on the colonisation system, and the patient put to work at his trade or to do work of a marketable value, I do not think any other conditions could prevail except those as between employers and employees.

Take a carpenter from Cambridge, where the rate of 11½*d.* per hour is paid, give him three years' treatment, during which time he has an average of 280 working days in a year, doing each day four hours work. Can it be expected that he should do a work value of £42 and receive nothing in return? This is taking very low figures, because it is more than probable that he would work eight hours a day during the last year. For the married man this would be impossible, unless his family were provided for.

A man must be allowed to retain his self-respect, independence, and liberty as far as the treatment will allow; this he can do only if he is paid a living wage for his work. I do not think many men would accept voluntarily treatment under any other conditions.

Could they be compelled? I certainly think their friends would have something to say. This would matter little if there were only a few cases of tuberculosis, nor do I think that the voice of the trades unions should be overlooked or underestimated. Would they stand by while a large number of men were put to work at various trades all over the country at wages below the general rate or no wages at all?

The cure of tuberculosis is of greater national interest than individual interest, therefore the State should make adequate provision for its treatment, also for the patient after treatment has ceased. The writer may be accused of being selfish and asking too much, but it must be remembered that the working man finds it next to impossible to help himself, he cannot create work of a suitable nature, but must return to objectionable surroundings and ultimately be a source of danger to other people; therefore, is it too much to ask that provision be made for him?

I have wandered far from the point, but probably the questioner will be able to sift from these scrapes of the pen some sort of answer to his questions. For what they are worth I should like to make one or two further remarks on the last question.

If a system of colonisation were started and it was thought necessary in the case of a married man to remove his family into the estate it would, of course, be necessary to give the family circle some advice. This should as far as possible be done by the medical officer. Visits by lady health visitors are not, as a rule, appreciated by the better educated of the working classes, and the whole thing is aggravated by the fact that public bodies usually appoint maiden ladies to these positions, and however well trained they do not understand the intricacies of the domestic hearth.

Where a large estate and a large number of patients are being dealt with it might not be desirable for a patient to occupy a shelter during the later stages of his treatment. For a single man boarding out on the estate institutions might be provided.

Where the former was in vogue I think the patient should be allowed a certain amount of discretion in the choice of place, as personally I should strongly object to board where there was tuberecular trouble. Where institutions or such like are resorted to they should be designed with a view to giving each patient one place of privacy.

L. P., Bourn Colony, November, 1916.

Views of a Traveller for Engineering Firm.

Question 1.—**My *answer* is in the affirmative, in view of the fact that the health of myself and family would benefit in consequence.**

Question 2.—Answer: In my particular case it seems rather a difficult problem to find suitable employment in the country village, as such places do not offer many opportunities to the commercial man who has received training appertaining to city requirements, so that I am of the opinion that one could not lay down any stipulations regarding the nature of the work desired, but simply state as the only conditions that one were given a fair wage in order that a good education could be given one's children (which matter I refer to in a later paragraph) and to enable one to live in respectable circumstances.

Question 3.—Answer: This opens up rather a difficult problem in the case of the married man, as having a wife and family dependent upon one, one most naturally desires to obtain employment of as permanent a nature as is possible under ordinary circumstances, although I would state at this juncture that I am not foolish enough to imagine that any employment is absolutely permanent, as neither employer nor employee can foresee what circumstances may present themselves which would necessitate one relinquishing the duties one was fulfilling. Nevertheless, I would certainly wish to enter into an agreement whereby my services would be retained so long as I continued to fulfil my duties to the entire satisfaction of my employer.

Question 4.—Not applicable.

Question 5.—With reference to that question, I am convinced that to answer it fully one would be required to state one's views under various subheadings; therefore I propose to do this as follows:—

(a) *Mode of living.*—I mention this first, as I consider it the most important factor in dealing with this question. One must bear in mind the fact that this scheme is intended for persons who with ordinary care and few exceptions will be in a position to carry on their daily life as heretofore. Therefore I am fully convinced that the married man will wish to have his own private dwelling in which he may live with his wife and family. Hence this is the first and most important condition I would lay down before entertaining the idea of taking one's position in connexion with this scheme.

(b) *Nature of employment.*—I think that difficulty would arise in finding employment for some men, as in my own particular case a tuberculosis institution does not offer any opportunities for one of my calling, therefore the only alternative would be for me to accept a post of a different nature from that which I followed previous to joining the Army.

I do not consider it necessary at the moment to expound one's qualifications, but I would, under the circumstances, be prepared to consider any position of trust on the organising, administrative, or secretarial staff if such were offered me, if some mutual agreement could be arrived at concerning remuneration, which question I propose to deal with next.

(c) *Remuneration.*—In dealing with this question one cannot state anything definite in view of the fact that one does not know what position one would be offered, therefore one must consider to what extent one would be prepared to make financial sacrifices in order to have work and general surroundings of a favourable nature, thereby retaining that most valuable asset "good health" and also to be of economic value to one's country.

One wonders why any ex-soldier should be called upon to make financial sacrifices, when one considers that the disability from which he is suffering has been caused solely through military service, as one hears of endless committees, &c., being formed to assist, train, and find employment for ex-soldiers who have lost limbs, &c., and also to give financial assistance to dependants whilst undergoing training for a new calling if the soldier's income is reduced through such incapacity, yet the discharged tuberculous soldier is left to struggle on on probably half the income of pre-war days.

I have no doubt that the time has come when this question will have to be faced, and I fail to see why some post in connexion with a sanatorium or similar institution could not be offered and the salary supplemented by a permanent pension, thus making his income near that which he was in the habit of receiving before his patriotic instinct took him to the recruiting office, full of health and energy.

I venture to think that the reader may think my remarks are sentimental, but I feel I cannot find words to express my feelings of indignation towards those responsible for the welfare of the discharged tuberculous soldier.

(d) *Education of children.*—This point must not be overlooked in accepting any post in connexion with the scheme.

It was my ambition in pre-war days to endeavour to attain some position which afforded remuneration sufficient to allow one to devote a sufficient sum of money to this matter, as I consider it most essential that one's children should be given an opportunity of receiving a sound education, and therefore I should not consider the country village one of the best places to receive same. I have no doubt, however, that some arrangement might be arrived at whereby one's children could be sent to a boarding school if one's income were sufficient to defray expenses.

I now close, trusting that the foregoing remarks will be received in the spirit in which they are penned, my endeavour being to offer some suggestions which would allow the discharged tuberculous soldier to become a national asset instead of a danger and an encumbrance.

A. H. C., Bourn Colony, August 18th, 1917.

Consideration of Above Answers.

These answers to the questions submitted bring out one or two points which are well worth considering. One is the very important fact that both patients realise how essential it is for their recovery that they place themselves for some considerable time under conditions insisted upon by the After-Care Association. They do not hesitate about this; any hesitation, as illustrated by these two particular examples, and all are practically unanimous on the point, is due to the fact that no concrete proposals are ever placed before the men. It is, as Paterson has repeatedly said, the height of folly to say to these men, "You must find a light job in the country and carry out the treatment there." Would anyone in his senses make such a remark to a well-to-do patient? Of course, the answer is "No," and the patient is advised to live under conditions which you know are within his reach. The only difference is that the well-to-do patient has, at his own expense, the opportunity to live under these ideal conditions—conditions not available in the case of the working man, and as in the case of the tuberculous soldier, so with the tuberculous civilian working man, an opportunity should be given him to follow out medical instructions under improved conditions. The generous pension given by the State to tuberculous soldiers will, if properly handled, be the means of establishing the principle of "equal opportunity," a valuable phrase, but hackneyed from its frequent repetition in another sense.

Provided that the surroundings are healthy and adequate the patient may be allowed to return home, but he should then be followed with a course of after-care, which ensures that he is provided with an adequate food-supply and that the conditions under which he lives, and the rooms and shops in which he works, are not obviously undesirable and unhealthy.

CAMBRIDGESHIRE AFTER-CARE SCHEME.

The following are the lines on which the Cambridgeshire After-Care Scheme has been inaugurated, and, working in close coöperation with the Colony system, good results have been obtained and still better are confidently anticipated.

The Cambridgeshire After-Care Association was formed for a very special purpose. It was designed to help such cases as presented certain favourable features—so to assist patients that the benefit of sanatorium treatment might be considerably prolonged, it being hoped that the great gulf which was fixed between sanatorium conditions and those of ordinary life might be bridged over with some degree of success at any rate.

In any scheme of after-care it is obviously useless to treat all cases as if they were identical. The difference existing both as to the extent of the disease and the resistance which the patients offer to the spread of the disease, as well as their social conditions, working conditions, and a great number of other conditions, must be studied separately.

Cases of tuberculosis are divided into three categories. Early cases, which are most favourable for sanatorium treatment; middle cases, which, as a rule, are not so favourable; and advanced cases.

Gradual Return to Suitable Work.

In the first category after-care is designed to place the patient in such favourable conditions that the maximum amount of benefit may be derived from a stay at a sanatorium, *and that such benefit shall not be wasted when the man returns to his former occupation.* Again, after-care in this group is designed to enable certain of the patients to take up more suitable occupations than those on which they were engaged when they contracted the disease. The working capacity of such patients varies greatly, but as a rule a large proportion of them can be allowed to work for almost, if not quite, a full working day. It is really a question of time and grading, for in many cases if the work is resumed gradually the patient adapts himself to full work more readily and for a much longer period than if he is at once plunged into full work on his return from a sanatorium.

The principle which has been taken advantage of in the Cambridgeshire After-Care Scheme is that which allows a patient gradually to resume his former occupation, if this is suitable, under conditions as nearly ideal as possible. The great dividing line which separates the working man from his more fortunate neighbour is that involving the presence or absence of the opportunity of gradually resuming a former occupation after treatment has been carried on for a considerable time, during which time the patient has had to lead the life of an invalid. A well-to-do man never thinks of returning to a full day's work immediately on his return from a sanatorium. He takes up his tasks very gradually. He has no anxiety as to his financial position, and has no difficulties about the provision of an adequate food-supply for himself and his family. He has ample opportunity of taking long rest-periods, and any danger of over-fatigue is entirely eliminated.

Until the Cambridgeshire scheme was inaugurated the working man patient had no opportunity of restarting under similar conditions. If he dared to graduate his work the resulting financial loss crippled him and his family so

severely that in a very short time a great reduction in his food allowance was inevitable. The only other course open to him was to forfeit his independence and become dependent for help upon some charity or similar organisation. When he resumed his occupation, to whatever small extent, the contribution he received from his Friendly Society, part of which came from the State and part from the private side of the club, was immediately withdrawn, and left without any visible means of support he was forced to plunge into the turmoil and strife of competition to earn, if possible, enough to support himself, his wife, and his family.

We have previously noted that it has been stated on the highest authority that the chances of recovery of a well-to-do person are three times as great as that of a working man, the only apparent difference between the two being that the rich man has an opportunity of gradually resuming his employment—employment of a suitable nature, whereas the poor man has to return to unsatisfactory work for unsatisfactorily long hours—*at once*.

Is it not now desirable that some definite arrangement should be made for the continuance of pensions for some time after the patient is, superficially, fit for work? At present a pensioned tuberculous soldier is called periodically before a board convened to revise his pension. He is there questioned as to how long he can work and how much he can do, and according to his answers his pension is continued or curtailed. Here, surely, is a weak strand in the rope of our scheme; no particulars are, as a rule, furnished by the institution in which the patient has been treated or trained as to his working capacity or as to the extent of the progress of the disease as determined by continuous observation of the doctor in charge.

After a necessarily cursory examination the patient's pension may be reduced just at a time when plenty of food and further encouragement are required to bring the case to a successful issue. If these pensioners are to be induced to work in our farm or training colonies, we must understand that no board will, without consulting the colony physician or the tuberculosis officer in charge of the patient, reduce a pension too rapidly.

It would certainly be a move in the right direction if in cases of tuberculosis reports and suggestions from sanatoria or colonies in which the patients reside could, as a matter of routine, be forwarded to the boards before which these patients have to appear, or that consultations should take place between the pensions boards and the medical officer in charge of the area—the tuberculosis officer, who, usually, is the only person capable of giving a complete and satisfactory return, &c., of the progress of the case and the working capacity of the patient.

The Cambridgeshire scheme, then, was founded with the object of overcoming this fundamental drawback, and we think that the time has arrived when it may be well to publish the results which have already been obtained and to indicate the lines upon which the desired ends have been attained.

Outline of Scheme.

The After-Care Association is composed mainly of members of the various Friendly Societies operating in the county, and is essentially, in every sense of the term, a democratic institution. Each society has its Lodge or Court in every town or village in the administrative county in which the association works, and is represented on the association by a certain number of members. It is clear that the county is divided for this particular purpose into very definite areas, each area having a representative in touch with the local conditions, and having personal knowledge of every member of the particular Lodge or Court. The advantage of such a connecting link between insured persons and the association is of inestimable value, as it is clear that without such personal touch and supervision there is a great danger that the malingerer may escape detection. The arrangement arrived at, however, renders it difficult for the medical adviser in charge of the scheme to be deceived by the applicant for the grant, and, what is even more important, enables a personal local touch to be maintained between the medical officer and the patient.

In this scheme grants are made on the recommendation of the medical officer of the association—the tuberculosis officer. Applications are often countersigned by the general practitioner in charge of the case. There are therefore very efficient safeguards from a medical point of view that the applicant is a suitable case for the operation of the after-care scheme, and it is obvious that no undue pressure can be brought to bear upon the two medical men to authorise the expenditure of the funds of the association, except to the best advantage. Moreover, as explained in the previous paragraph, a very effective check is maintained by the local secretary, who, as a rule, is a working man well versed in local conditions, with a knowledge of the personal needs of the patient and of the desirability or undesirability of assisting the patient in the way to be explained presently. The association works, then, with a central executive committee, with the medical officer as honorary adviser, and through a series of local Lodges. The personal element is thus utilised to its fullest extent, whilst the knowledge available from these various sources is used in advancing the interests of the patient and at the same time in safeguarding those of the association.

The association pays by cheque certain amounts, which may be varied from time to time, according to the needs of the case. The sum expended is, as a rule, equivalent to that which a patient would forfeit under ordinary Approved Society arrangements when he passes off his club and starts his ordinary work. When a man returns from a sanatorium and it is found that he can resume his former occupation as suitable, the employer is communicated with, sometimes by the secretary of the association, or more often by the medical adviser, the graduated work scheme is explained to him and his help is sought. It has been found that when the matter has been fully explained to them the employers in the county are very sympathetic towards the scheme and are willing to help in any way they can. It has been made a matter of principle to accept as little as possible in the way of monetary grants from the employers concerned; this is important, as it is desirable that they may not have an idea that they are acting as philanthropists. The only concession they are asked to make is that the men may be allowed to work for them in the manner and under the conditions presently to be explained. It is made clear that according to his strength the man should work at first, say, four or six hours a day; and the employer is expected to see that the patient receives the ordinary trade union rate of wages of the district for the number of hours he actually works. This arrangement has been found to work very satisfactorily in the area concerned, although some employers have expressed doubt as to whether such an arrangement could become permanent, especially in times when labour is plentiful and when it would not be difficult to get as much labour as is required at full-time work. Whatever may be the danger of this difficulty arising in the future, up to the present it has not presented itself.

A Typical Case

Let us take a typical case—that of a farm labourer who has passed through a course of sanatorium treatment.

The man working for a farmer for four hours a day will receive for that four hours the ordinary rate of wages payable for that time in the district. He will thus receive 10s. per week from his employer. This will be supplemented by the After-Care Association with 10s. per week, the amount of sickness benefit the man forfeits by undertaking to work and so coming "off the club." It has been found that as a general rule a man is quite willing and anxious to work the prescribed shorter hours under these conditions, for he feels that he is thus carrying out to the letter the treatment which he receives at a sanatorium.

The man is in the meantime kept under careful observation. It is usually possible for him to present himself for examination at the dispensary at the end of three weeks. A report is furnished by the health visitor as to home conditions; the local secretary is satisfied that the man is endeavouring to carry out instructions, and if his condition is found to be satisfactory the period of work is increased by two hours per diem for the next three weeks. The man now receives a bigger wage, but the "sickness benefit" is kept at the same figure in order that he may be encouraged to continue to earn the larger wage when he knows that his perseverance will not be prejudiced by the premature cutting down of the allowance from the association.

Another examination is made at the end of a specified time, and if things are again found to be satisfactory the man is encouraged to put in full time, the allowance from the association being maintained as before. This places the patient in an extremely favourable position, coinciding with the period during which, exerting himself to the utmost, he has reached his maximum working capacity, when

too, his food allowance is also at its maximum—the most critical time of the convalescence. The allowance from the association cannot, of course, be permanent, but it is continued for a period varying according to the case, until it is quite clear that the man has got used to working full time and has become re-accustomed to his former surroundings. Then in a succession of 21-day periods the allowance is reduced by 2*s*. 6*d*., so that at the end of another nine weeks the man ceases to receive anything from the After-Care Association, and has returned to a position of absolute independence.

It is our experience that on these terms and under these conditions the man readily resumes his former work. He is spared the plunge straight into work-a-day conditions which he would have to have made if the association had not assisted him, and this at the most critical period of his treatment. The way is made easy for him by dividing his ascent to health into practicable stages.

So far, we have described the progress of the most suitable case—the case which can be dealt with easily in this scheme. Of these cases a considerable number have passed through the hands of the association in this particular way; in every case the results have amply justified the energy, time, and money expended on them. Comparing these cases with those allowed to return home without receiving this assistance from the association, there seems to be a marked shortening of the time elapsing between the patient's return home from the sanatorium and his resumption of full work. There is always, we find, a tremendous inclination on the part of the patient who has completed his treatment at one of certain sanatoria to become so wrapped up in himself, and to be so impressed with the gravity of his ailment and with the importance of not exerting himself unduly, that, clinging to his club money, he hesitates to re-enter his former occupation; he almost invariably looks for some further help, very little persuasion being necessary to induce him to accept some form of charity until, as he puts it, he gets quite strong. This attitude can be successfully combated by carrying on the treatment at sanatoria entirely on industrial lines—that is to say, by marking out the exercise allotted to the man, as far as possible giving it to him at his own trade, and commencing it at the earliest possible opportunity. It appears to us to be a gravely mistaken policy to treat early cases of pulmonary tuberculosis by means of graduated work unless that work is one in which the patient recognises his former employment or, failing that, one which gives a practical result: only then does he realise that under the favourable conditions obtaining at a sanatorium the actual work, far from contributing to his disease, enables him to fight against it—a realisation invaluable for the patient, for having reached it he is willing to return to his home and needs little encouragement to restart his former occupation (provided always that the occupation is one of a suitable nature).

THE WORK OF THE AFTER-CARE ASSOCIATION.

The work of the After-Care Association may well be illustrated by concrete cases, though we are well aware that the objection may be urged that insufficient time has elapsed between the patient's discharge from a sanatorium and the point at which the case is reviewed to allow of any very definite conclusion being arrived at that permanent benefit has accrued from this treatment. This line of argument may be entirely valid, and we shall have to wait until a considerably longer time has elapsed before we can definitely state that our method has been of permanent benefit to the cases concerned. Nevertheless, we are of opinion that we have already sufficient evidence to show that unless the method which is here being advocated had been adopted many of the patients would still be in receipt of a diminishing club allowance and would not have become producing economic members of the community.

In dealing with such cases two points must be kept constantly in view: 1. The benefits which accrue to the individual patient. These benefits may be a very considerable prolongation of a working life, greater contentment of mind, and other personal considerations. 2. A definite gain to the community in the form of value of the work performed by the man and the consequent gain to the State and the Friendly Society concerned by the gradual withdrawal of the man from the list of those receiving sickness benefit.

The tuberculosis problem is, of course, not completely solved on these lines, as is imagined in some quarters, nor is it contended that the Cambridgeshire After-Care Scheme can be put forward as constituting any new specific for the cure of tuberculosis. It has been designed rather with the object of rendering a consumptive working man of economic value to the community, and so of preventing the great drain on the funds of State and private side of Friendly Societies working under the National Insurance Act, and at the same time of enabling the patient to be placed in the most favourable position for the arrest of the disease.

Fifty-two cases have been assisted on the principles laid down during the period under review—three years. Out of these 52 cases, all in the first or second stage, only one has died; the others at the time of writing are all engaged in remunerative work. Those who have been assisted during the last few months are naturally not yet on full work, but those who were assisted between two and three years ago, with one exception, are all at full work. Nearly all the cases are those of men following country pursuits, but one or two are clerks in a factory or in an office; others are men who have been assisted to change their occupations for the benefit of themselves and their families. How many will fall out in a year's time or in two years' time it is impossible to say, and for this reason we wish to be quite guarded in making any undue claims for the advantages of this scheme. In one particular, however, it seems quite clear that there has been a considerable gain. In many cases the patients would have hesitated very considerably before "coming off the club" if there had been no special inducement for them to do so. Once they are "off the club," many hesitate to go on again, especially if they can gradually increase the number of their working hours and slowly accustom or "acclimatise" themselves to the new conditions.

A very typical case is that of a worker in a skin yard. When first seen the disease was in its second stage. The man was "on his club," and was apparently content to remain there. He had been "incapacitated" for nine months, and was firmly convinced that he would never be able to work again. His wife went out charing. Having found the man a suitable occupation—driving a light cart for his firm—he was induced to work six hours a day, being given a bonus of 10*s*. a week. Since then, during the past three years, the man has continued to work with but slight and temporary breakdowns. He is still working.

A farm labourer similarly treated, after going through a sanatorium course, is still at full work (harvest work at present). He was only induced to re-start work by the offer of assistance together with the willingness of the employer to take him on for part-time work to start with.

The proof is not conclusive, the data are not sufficient, but the facts point to the conclusion that the scheme is a step in the right direction.

THE PROBLEM OF FINDING SUITABLE WORK.

We have already stated, in reviewing the answers of the patients to a set of questions here given, that the crux of the whole matter seems to be the suitability of the work offered, and whether the work offered is really a concrete proposition. In a rural district such as Cambridgeshire, the finding of employment for such patients as are here described offers less difficulty, perhaps, than would be experienced in other parts of the country, especially in areas covered with crowded dwellings, large towns, mining districts, and so on. The difficulty is great even in a rural area, and will undoubtedly be greater in a county more densely populated, especially where the spread of the knowledge of the disease and of its treatment is defective.

Even in Cambridgeshire, where probably the conditions are simple and the difficulties less acute, the problem of finding work for ex-patients has by no means been solved in its entirety. It is, however, we hope, in the process of solution, the first essential having been secured—viz., *a method by which tuberculous labour may be subsidised for the time being;* for such a length of time as will secure the patient a favourable re-start at an occupation eminently suited to his condition. This principle, as has been explained, has been developed by the After-Care Association, and although the practice has been limited, the way of reform is clearly indicated.

In order to test still further the method, advantage has been taken of the very favourable opportunities which are afforded during the treatment of the tuberculous soldier, and doubtless the Ministry of Pensions had the principle of subsidising tuberculous labour in its mind when the proposals

were drafted. The proposals, however, fall short in so far that they do not provide the necessary accommodation for instruction in, and the carrying on of such labour—though once it is subsidised it can only be a matter of a few months before the provision of such accommodation will be an accomplished fact. In other words, we shall have established the chief essential for the after-care of the tuberculous soldier—that of providing him with work and subsidising his labour so that he may become a wage-earning member of the community.

Working Capacity of Ex-sanatorium Patients.

It is agreed that (according to the stage of the disease) an ex-sanatorium patient can do only from 30 to 60 per cent. of the work done by the normal individual; and since this is an ascertained and undisputed fact it is foolish to ignore it. That we have ignored it in the past is only too evident, and accounts for the story of failure which has followed most after-care efforts. *If a man is capable of doing only 60 per cent. of the work of a normal man it is only courting disaster to attempt to place him amidst his old surroundings and without assistance, in competition with the strong full-blooded worker.* To send him back to such surroundings with a pint of milk a day would seem humorous if it were not so tragic. It is inadequate, unscientific, senseless.

Hitherto the essential facts of the case have been ignored, so much so, indeed, that a mass of opinion, both medical and lay, is at present on the verge of condemning the principles of sanatorium treatment. The principles are sound enough; it is the method of applying them which is at fault. The essential facts to be grasped, if we are to deal satisfactorily with this problem, is that a consumptive working man cannot equal in working capacity a full-grown healthy man, and that until a specific cure for tuberculosis has been found sanatorium treatment can do no more than retard the disease and, under favourable conditions, arrest it. If, therefore, the retarding process can by some means be indefinitely prolonged whilst the man is doing industrial work our end is gained. Such means in our present state of medical knowledge would seem to constitute the right form of treatment both for the individual concerned and from the point of view of the State.

In densely populated districts and in areas where the housing conditions are bad and the hours long the chances of retardation of the disease in the ex-sanatorium patient are reduced to nothingness, and it seems to the writers that he will be a bold man indeed who attempts to carry on after-care in such surroundings. Just as the State recognises that it must be responsible for the treatment and training of ex-soldiers who have been incapacitated by the war, so the State ought to shoulder the responsibility of these civilians who fall by the way, succumbing to tuberculosis. The stress of modern life, inadequate housing, and severe competition are responsible for the break-down of such men, and it seems that since the State has already shouldered so much responsibility it should go a step farther and make sure that the opportunity be given to these men to do the work of which they are capable, though it be but a percentage of a full day's work.

THE BOURN COLONY.

This thought, together with others, made the writers attempt in a small way to estimate the amount of work of which sanatorium patients are capable, and to ascertain whether under suitable conditions various forms of labour could not be carried out without the elaboration of sanatorium surroundings; hence the foundation of the Bourn Colony, where it has been a matter not for surprise only but for congratulation to see what can be accomplished with a minimum expenditure of money, though not of time and energy.

The Bourn Colony was started by one of us (P. C. V.-J.) a little over two years ago. The "colony" consisted at that time of an old country house standing in its own grounds of two acres. It had long been empty, the garden was unrecognisable, and other parts of the ground resembled a wilderness. On this site a few shelters were erected and the patients (early cases with and without T.B. in the sputum) installed. In the house resided a matron (a trained nurse) and a nurse, together with a cook.

The number of shelters was gradually increased and the work of planning out the colony was begun. Paths had to be made and the land drained; a large pond in the middle of the grounds had also to be drained and filled up. To accomplish this a trench 6 feet deep and 40 yards long was dug by the patients. As soon as this necessary work had been done our attention was turned to the further fitting up of the colony for the reception of more patients. Since each patient lives in a shelter, the matter was easy of solution, and it was only necessary to erect more shelters to make the place available for the reception of the larger number of patients. We were, however, without a trained carpenter, but one or two of our patients being rather more skilled with their hands than the others volunteered to design and make a shelter which would serve as a pattern.

Our colony at that time resembled somewhat closely the island on which the "Admirable Crichton" of the play landed after the shipwreck. In such a community one patient will always take the lead, and if it is fortunate in having the right type of man the work will go on. This, at any rate, was what happened at the Bourn Colony in its early days. We were fortunate, also, in having a discharged soldier who had been a market gardener, and in a very short time, as he was able to enlist the sympathies of some of the patients, the garden grew apace.

The beginning of the colony well illustrates the principles on which it is run. Patients are encouraged to follow an occupation as near as possible to that on which they were formerly engaged, with the consequence that the colony has developed on simple lines merely with the aid of the patients themselves. After some time a carpenter patient arrived, and, guided by his experience, shelters have been re-designed and have been made at a greatly accelerated pace; now practically half the shelters in the colony are of home construction, and the patients, seeing the efforts of their labours amply rewarded by the installation of another patient who has benefited by open-air treatment in a hut made by themselves, are encouraged to push on with other shelters. As we have been able to extend the scheme on the recently acquired Papworth Hall estate, a still greater number of patients can be accommodated, and the work at Bourn is growing, the construction of shelters which will be worthy of the newer institution going on rapidly.

Practically all the patients now at Bourn are discharged soldiers; on admission they all had tubercle bacilli in the sputum, but, with the work as planned out, they are steadily improving, and—a very important matter—are taking a keen interest in their surroundings, a great factor in adding to the efficiency of the work and the benefit obtained.

The original capital laid out in the acquisition of the house and the rent of the grounds, in the building of a small sanitary block, in the purchase of extra bedsteads and bedding for the new shelters, in replacements, &c., was the moderate sum of £500, and up to date this has enabled 88 patients to be treated on the above lines. After two years' work 90 per cent. of the patients discharged from the colony are now at full work, and we think it can be claimed that the treatment is not only economical but that the results are in no way inferior to those obtained in sanatoria enormously more costly to build and much more expensive to equip and administer.

The colony being, of course, used as a training ground in connexion with the After-Care Association, a number of patients have been admitted who have had preliminary treatment in other existing sanatoria. Those who have returned to the county and have not been able to work have been taken in at the colony and there encouraged to make a new start on some suitable occupation. The latest addition to the activities of the colony is the tailor's workshop, which, again, has been erected by the patients themselves. The occupant, an ex-army man, who is a tailor by trade, is engaged in gardening work part of his time and part in tailoring in his specially designed workshop.

COMBINED SYSTEM OF INDUSTRIAL COLONY AND AFTER-CARE.

We have now no doubt that the experience gained at Bourn Colony, together with the experience of certain sanatoria which have made a feature of the introduction of trades into the sanatorium régime, will be of enormous value in indicating the way to the reorganisation of sanatorium treatment. Such experience affords promise that we have only to abandon the short sanatorium treatment and work on the lines of a prolonged stay at the less

expensive and more moderately staffed industrial sanatorium, run entirely on colony lines, to obtain the results which we have been led to expect and can now confidently anticipate.

Many local authorities at the present time hesitate to put up expensive buildings for the treatment of tuberculosis on what one might already describe "old lines." Let them be encouraged to work on the colony principle and follow their cases up by means of an after-care association.

It is the intention, in Cambridgeshire, to proceed still further along the above slightly sketched lines, and by means of a subsidy paid by the State through the Pensions Ministry or through Friendly Societies (the principle as will be seen is the same), to encourage the formation of a Garden City with organised industries in connexion with a central institution. Part of the Papworth Hall estate, which has recently been acquired for the working of the scheme, is being satisfactorily adapted; model workshops where the consumptives will in time be employed are being fitted up, and the model village to accommodate them, which already exists, will, we hope, also be acquired. It is anticipated that the maximum results will be obtained by sanatorium treatment, and that the breakdown which under present-time conditions so frequently occurs when the working man is discharged from the sanatorium may thus be prevented.

Summary of Advantages of System.

To sum up, the following advantages of the combined "colony" or industrial sanatorium and after-care system as here outlined may, with considerable confidence, be anticipated.

1. Prolongation of the period of treatment with—(*a*) more intensive, because more interesting and better graduated, treatment; (*b*) the utilisation of suitable occupations in such treatment even during the earlier stages of residence in the colony; (*c*) the continuation of training and the consolidation of the improvement already gained during the preliminary stages of treatment; (*d*) more personal supervision and immediate encouragement.

2. The utilisation to the best advantage of the funds drawn from (*a*) the National Insurance Commissioners; (*b*) the rates; (*c*) the Pensions Ministry; (*d*) Approved Societies; (*e*) voluntary subscribers.

3. The pooling of the advice and countenance of these various authorities, bodies, and individuals.

4. The preparation and encouragement of the patient to re-enter, under more favourable conditions, on the struggle for a livelihood without having to contend against the drawbacks attending overwork, overstrain, and anxiety.

5. The moral encouragement afforded to the patient by the knowledge that these favourable conditions, already tried and successful in the case of others, are available in his own special case.

6. The gain to the community of a productive member in place of a useless consumer. It may be objected that this member is producing but 50 per cent. or 60 per cent. of his full or original amount, but to this it may be answered that this 50 per cent. or 60 per cent. may represent considerably more than the full capacity of many a healthy worker.

7. The segregation and isolation of "centres" of massive infection and the bringing down to a comparatively safe dilution, of less—but still under certain conditions—dangerous quantity.

8. The education of patients in the "ritual" necessary for their own "nutrition," maintenance in, or restoration to, health and strength, and especially the knowledge of how to render themselves harmless to themselves, their families, and their friends.

9. The inculcation of a feeling of moral and physical self-respect involved in,

10. The knowledge that they are being cared for, not out of charity, but because their fellows—the State or community—recognise that they, members of this community, have fallen by the way, not as a result of their own misdoings, but because surroundings were unfavourable and conditions adverse, and that these righted they still have a chance of making a success of their life and work.

A LONG APPOINTMENT.—At the last meeting of the St. Thomas's (Devon) board of guardians a resolution was passed unanimously expressing the gratitude of the guardians to Mr. Henry Wallace Furnivall for his 40 years' devoted service as medical officer for the Woodbury District, and expressing regret at his resignation of the post.

THE VALUE AND LIMITATIONS OF SANATORIUM TREATMENT AS REGARDS THE WORKING CLASSES.[1]

BY W. O. MEEK, M.B., B.S. LOND., M.R.C.S., L.R.C.P.,
MEDICAL SUPERINTENDENT, BROMPTON HOSPITAL SANATORIUM, FRIMLEY, SURREY.

IT must be admitted that the results of sanatorium treatment of the working classes, as revealed by the after-histories of discharged patients, are at present far from satisfying. It is not that this particular class of patient fails to respond to treatment. Those drawn from a large city and its immediate neighbourhood, who form a very large majority of the total admissions to the sanatorium at Frimley, do, given reasonable initial selection, respond rapidly and well, generally are intelligent and easy to instruct, and make an attempt to carry out sanatorium principles in their subsequent life. In fact, the response to and immediate result of treatment in such cases are, in my experience, strikingly and almost uniformly good.

During the three years 1905–6–7, 292 patients, in whose sputa tubercle bacilli had been found, were discharged from the sanatorium at Frimley. Of 266 of these, who were traced to the end of the first year following that of their discharge, 65·8 per cent. were well and working, 24·4 per cent. were alive, and 9·8 per cent. were dead. Of 245 traced to the end of the second year following that of discharge, 56·8 per cent. were well and working, 21·6 per cent. were alive, and 21·6 per cent. were dead. Of 209 similarly traced to the end of the fifth year following that of discharge, 38·8 per cent. were well and at work, 14·8 per cent. were alive, and 46·6 per cent. were dead. These 292 were selected cases, carefully chosen by the physicians to the Brompton Hospital, and the great majority had undergone preliminary treatment at that institution, thus being under consecutive treatment for a very considerable period.

I propose to consider very briefly some of the chief factors responsible for such a rapid loss of working capacity in so high a proportion of cases, which factors are, in the main, well recognised, and to point out certain directions in which there seem to lie opportunities for improvement in the treatment of this class of patient.

I. *The Return to Faulty Environment.*

The great majority of these 292 individuals returned to their work in London at which they had broken down previously. The frequency and rapidity with which loss of condition and return of unfavourable symptoms follow a return to urban life are very striking. It is not easy to point to any one specific cause of this relapse. In a proportion of cases it follows immediately upon an attack of influenza or of common cold, accidents inseparable from town life. In others no such exciting cause can be traced. Its occurrence does not appear to depend to any great extent upon the presence or absence of what ordinarily constitutes "after-care."

At the time of the discharge of these 292 individuals there was little or no special provision for their after-care. Lately there has been improvement in this direction, and early in 1915 a special branch of the Almoner's department at the Brompton Hospital was instituted to deal with cases discharged from the sanatorium. A health visitor was also appointed. Homes were visited, arrangements made for the patients' return, help given where necessary, and patients were persuaded in gratifying numbers to present themselves regularly to report and to keep under the observation and treatment of hospital, dispensary, or private doctor. In many other ways useful work was done, the whole constituting a fairly complete system of "after-care."

For some years past a change to a more suitable environment has been urged upon many patients on their discharge where such a change seemed desirable. Until recently, in the absence of efficient supervision, it has been possible to accomplish this in comparatively few instances. Since the institution of the after-care department it has proved feasible in a much larger number.

[1] A contribution to a discussion at the Medical Society of London on Nov. 12th, 1917.

In order to demonstrate the beneficial result of such change of environment tables have been prepared contrasting the immediate after-histories of two groups of cases.

A. All traced instances of "apparent arrest of disease" and restored working capacity discharged in a certain year, and returning to their former occupations in and about a large city.

B. All traced instances of restored working capacity discharged in the same year and who effected a recommended change of environment.

(A) During 1915 a group of 32 cases, presenting important features in common, left the sanatorium. They all came from urban working conditions. In all tubercle bacilli were present in the sputum at the commencement of treatment; in none were they so found at its conclusion. The average number of lobes of the lungs in which any signs of disease had been noted was 1·8. They formed an excellent collective example of the "good sanatorium case," and were classified on discharge as instances of "apparent arrest" of the disease. They all returned to the homes and working conditions in which they had broken down previously. The majority of the patients were of distinctly the better working-class type. Their homes generally were clean and not obviously insanitary, sleeping arrangements satisfactory, and wages good. The work to which they returned was of very varied character, but as a whole, neither particularly arduous nor dangerous. All those still alive had been traced up to the latter half of the present year (1917). Of these 32 people, at the time of the latest reports (averaging two years and a few months from the date of discharge) 10 (31·2 per cent.) were well and at work and had kept so; 5 (15·7 per cent.) were "fairly well" and still at work; 8 (25 per cent.) were alive, but unable to work; 9 (28·1 per cent.) had died.

(B) In the same year, 1915, out of a number of cases of relatively good prognosis who were recommended to secure improved conditions 44 were able to effect a change for the better. They were not specially selected as having only slight pulmonary lesions, for in a considerable number such lesions were quite extensive. Nevertheless, they all appeared capable of doing a reasonably full day's work and to have a fair chance of maintaining working capacity in healthy surroundings. In all tubercle bacilli were present in the sputum at the commencement of treatment, in 23 they were still present on discharge, in 21 they were not so found. The average number of lobes of the lungs in which any abnormality had been noted was 2·2. All have been traced into the latter half of the present year. They form a group roughly comparable to the one analysed above. Twenty-nine effected a change of both residence and occupation, five a change of occupation only, while ten found situations at their former employment in more suitable localities. Many made the change unaided except with advice, to others help was given in the search for work or in the removal of the home, for some situations were found, and for a few courses of instruction in motor-driving, &c., were provided. Six joined the Forces. In most instances the work and surroundings which they were able to secure were far from ideal, but constituted a marked improvement on their former conditions. Of these 44 individuals, after a lapse of time averaging a few months over two years and excluding one who was accidentally killed, 35 (81·4 per cent.) have remained continuously well and at work; 6 (13·9 per cent.) are well and at work, but have had time off from work for illness and in 4 cases further institutional treatment; 1 (2·3 per cent.) is fairly well, but not at work; 1 (2·3 per cent.) has died.

The time interval is short, and these lists are admittedly imperfect, as time did not permit a thorough attempt to determine the fate of untraced cases, and most of those who are abroad have been excluded. Again, it is likely that among those who have effected a change are the majority of the more resourceful, intelligent, and financially better situated individuals. While these lists are far from being accurate statistical tables, I believe they illustrate tolerably fairly the rapid wastage on return to urban industrial life and the improved outlook under better conditions. It seems possible that the attempt to return to working-class life in cities, large numbers of discharged sanatorium patients who are, or have been recently, cases of "open" disease, may have to be abandoned as entailing great waste of life, labour, and money.

Obvious alternatives are: (*a*) Greatly prolonged residence in sanatoria; (*b*) a long or short period of treatment, respectively combined with or followed by training and subsequent start in suitable work in a proper environment; (*c*) the establishment of rural industrial centres, in which patients could work at their accustomed, or some closely allied branch of industry.

II. *The Lack of Provision for Prolonged Treatment.*

The working-man, who is obliged to return to full work immediately upon his discharge, requires longer sanatorium treatment than any other class. In all but the really incipient case two or three months is a quite inadequate period. It is reasonable to urge that in those with "open" disease, however limited in extent, some months at least should be spent under sanatorium conditions after the stage termed "arrest" has been reached. This at present is impossible for financial reasons. With the exception of a few more fortunate individuals, the married man is obliged to return to work far too soon, and prolonged treatment can be given only to the unmarried, usually young, man without responsibilities, who constitutes by no means the most promising material.

As to the length of time necessary to render those with health seriously undermined by extensive disease fit to resume ordinary working-class life, I have little experience. On the staff of the sanatorium at Frimley are a number of individuals who were originally of this type. They have done good work continuously for several years, in some instances for so long as 11; but I think he would be a bold man who would counsel their return to other environment. I know that the annual holiday, when they revisit their homes for a short time, is a very critical period.

With some form of permanent colony for advanced cases in suitable surroundings and under constant medical supervision, there seems little doubt that their lives would be prolonged, with a varying degree of capacity for useful work, and that in a certain number more substantial results might be obtained.

III. *Lack of Provision for Re-treatment.*

A considerable number of discharged cases require re-treatment sooner or later. It may be that, following a period of steady work and good health, loss of condition or recrudescence of symptoms points to the probability of relapse. Prompt cessation of work and removal to a healthy environment are called for. Delay may entail loss of employment and serious illness. Improvement is most rapid and satisfactory under sanatorium supervision. Unfortunately, admission to charitable or other public sanatoria involves, as a rule, a long period of waiting. During the last two years the use of occasional beds at the sanatorium at Frimley has been sanctioned for this purpose. The cases have been selected in the after-care department at the hospital, preference being given to those in whom the prognosis at the time of discharge seemed relatively good. These few beds have done useful work, for, if taken in time, the readmitted case responds rapidly. I believe that serious relapse may often be averted by this procedure and that an extension of such facilities would be a true economy.

IV. *The Admission of Cases Unsuitable on Grounds other than Medical.*

Among the admissions to a public sanatorium are a number of individuals whose treatment is foredoomed to failure on account of their habits, lack of will power or intelligence. Though they may be excellent subjects upon other grounds of selection, and though they may make a good immediate response to treatment, they relapse quickly upon discharge.

Such persons form an appreciable percentage of the total admissions. The difficulty is more likely to be encountered where treatment is gratuitous or given from public funds. It is not easy to exclude such people, since frequently the defect is apparent only after a period of observation, and it is probable that cases of this nature will always influence statistics adversely.

V. *The Need for Earlier Diagnosis.*

The working man's only capital is, as a rule, his capacity to perform continuously a full day's work. Once his working capacity is permanently impaired, however slightly, his whole outlook is jeopardised and provision for his future rendered more complicated and costly. In his case early diagnosis is all-important. At present a considerable number of individuals reach sanatoria for the first time permanently crippled by extensive disease. In the absence of elaborate provision for "after-care," residence for a few months at a sanatorium does little or no permanent good to the great majority, their after-histories are dolefully reading, and it is doubtful if the expenditure of large sums of money for this purpose is justifiable on any grounds. Certainly, in the case of many, such money could be laid out infinitely more wisely in other directions for their benefit.

In a very disquieting proportion of these cases there is a previous history of initial symptoms disregarded or made light of. Since treatment of advanced active disease is so hopeless and since in even selected cases of manifest disease present methods call for elaborate and costly amplification, recognition of initial symptoms and supervision at the really incipient stage are all-important for the working man. It is at this stage he needs access to the expert physician for diagnosis and advice, warning of future possibilities, regular and skilled medical supervision over a prolonged

period, education, removal from obviously unsuitable environment, and all that constitutes "after-care." It may not be essential to send all patients away for treatment at this stage, but wherever initial symptoms are accompanied or followed by impairment of general health a period of residence in a sanatorium is probably the most efficient means of restoring condition and imparting valuable knowledge. These incipient cases retain their working capacity for very long periods after discharge from sanatoria, in whose records they constitute a considerable proportion of the cases classed together as "tubercle bacilli not found," and whose after-histories are so good. Other methods of treatment can show a high percentage of successful records in this type.

Where similar results follow such widely varying procedures as residence in sanatoria, regular attendance to receive medicine, or the inoculation of various kinds and doses of tuberculin, it seems probable that these results must be ascribed to the factors common to all such forms of treatment—namely, the warning, supervision, and greater or less degree of education and after-care which the patient receives. Recognised and supervised the incipient case does well, unrecognised and assured that nothing is amiss a considerable number certainly do very badly.

In touching upon these causes of "sanatorium wastage" I have emphasised, necessarily, the gloomy aspect of the problem. Nevertheless, I am convinced that given certain essentials—viz., early diagnosis, reasonable treatment, and a chance to spend his future working life in a proper environment—certain attributes of this class of patient make him the most profitable subject for sanatorium treatment.

THE CONDITIONS OF GROWTH OF *BACILLUS WELCHII* IN THE PRESENCE OF OXYGEN.

BY C. G. L. WOLF, B.A. MANITOBA, M.D., C.M. MCGILL,
CAPTAIN, R.A.M.C.;
AND
SERGEANT J. E. G. HARRIS, R.A.M.C. (T.), B.SC. LOND.,
BRITISH EXPEDITIONARY FORCE, FRANCE.

Bacillus welchii is classed among the strict anaerobes, and in working with this organism much care is usually taken to make the conditions as anaerobic as possible for its growth. Certain statements in the literature have for a long time made us suspicious of this classification, and in the following notes are presented some observations in this direction.

The matter of the presence of air was taken up many years ago by Tarozzi, and Ori and Wroszek, who claimed that the addition of small pieces of various substances, animal and vegetable, was sufficient to induce the organism to grow in the presence of air. A certain amount of discussion followed as to whether it was necessary that the material should be living or dead when introduced into the culture medium. Rosenthal claimed that these organisms could be grown in the presence of air provided that they had been adapted to this mode of growth by preliminary treatment.

Recently Wright has repeated the experiments of the previous investigators and has confirmed them. On these he has based certain theories regarding treatment. The idea is advanced of "niduses of lowered bacteriotropic pressure."

What appears to have escaped the observation of these investigators is the fact that given a simple culture medium of suitable character, the *Bacillus perfringens* grows perfectly well under those conditions which bacteriologists speak of as aerobic, *provided the medium is freshly sterilised*. This can be done without the addition of any adventitious substance such as potato, liver, apple, or platinum black. The original difficulty in getting the organism to grow under aerobic conditions was probably due to the relative unsuitability of the culture media which were employed.

The strains of *B. perfringens* which have been used in the present work are those which have been used by us in other series of investigations. They have retained all the cultural characteristics of the organism, and, what is possibly more important, their chemical behaviour has remained absolutely constant. We have every reason to believe that they represent quite normal strains of this organism. As will be seen, we have controlled these results with other strains, among them one from the Institut Pasteur, Paris, with identical results.

The culture medium used was a peptone solution made by the digestion of casein, to which glucose was added, and adjusted to a definite hydrogen-ion concentration (acidity) with the hydrogen electrode. Experiments which we have recently made, and which are reported in the *Journal of Pathology and Bacteriology*, show the important influence of this single factor—the reaction of the medium—on the growth of these bacteria.

The content of "peptone" was about 2 per cent. The amount of culture medium used was 10 c.c., contained in ordinary bacteriological test-tubes, 5/8 × 6 inches. The inoculation was made with three drops of a 15-hour old culture on milk, which was seeded from a 6-hour old culture on cooked meat. The inoculation was made with a fine capillary pipette, so that the amount of fluid introduced was, roughly, 0·1 c.c.

Preliminary Experiment.

A preliminary experiment gave the following results:—

Tubes of glucose peptone containing 10 c.c. of medium and provided with Durham tubes, were inoculated and incubated at 37° C. for 24 hours. All these tubes showed a vigorous fermentation. The Durham tubes were filled with gas.

As the Durham tubes introduced a complication, by providing that a portion of the medium should be more or less sheltered from direct contact with the air, a second set of tubes was used.

These were the ordinary bacteriological test-tubes described above, containing 2 per cent. glucose peptone. The area of fluid exposed to the air was about 2 square centimetres. A similar set contained Durham tubes. A third set was so arranged that they could be incubated in a sloping position and so expose a larger surface to the air. A fourth set consisted of quite large tubes, 1 in. in diameter, containing the same amount of culture fluid. These were also grown in a sloping position.

In the small tubes containing Durham tubes the bacteria might be expected to find conditions which were more or less anaerobic. In the small tubes incubated in the upright position there would be less chance of the bacteria avoiding contact with the air. The chances for contact with air would be increased with the small and large tubes in the sloping position.

Four types of media were used in these experiments: (1) 2 per cent. glucose peptone; (2) 2 per cent. lactose peptone; (3) 2 per cent. lævulose peptone; and (4) 2 per cent. maltose peptone.

Three different specimens of *Bacillus perfringens* were used. The first set was inoculated with *B. perfringens*, K 95, 16 hours old, on milk; the second set with *B. perfringens*, K 94, 16 hours old, on milk; and the third set with *B. perfringens*, K 90, 49 hours old, on cooked meat.

The bacillus fermented the different sugars equally well, so far as could be judged by the gas production.

TABLE I.

—	Total number of tubes.	Number fermented.	Number unfermented.	Per cent. fermented.
With Durham tubes	11	11	0	100
Without ,, ,, ...	12	8	4	66
Small slopes	7	3	4	43
Large ,, ...	3	0	3	0

From these experiments (see Table I.) it is clear that *B. perfringens* is not absolutely anaerobic. It prefers anaerobic conditions, but can develop when air is present. The greater the amount of air that has access to it the less favourable are the conditions of growth.

Further Experiments.

In order to test further the ability of *B. perfringens* to grow under aerobic conditions another set of experiments was arranged.

Tubes were prepared containing 2 per cent. glucose peptone at a favourable reaction for growth. The reaction was $P_H = 6{\cdot}6$. Each tube contained 10 c.c. of medium.

There were three sets of tubes, each set being inoculated with a different culture of the bacillus. Each set consisted of:—

1. A small tube containing a Durham tube.
2. A small tube without a Durham tube.
3. A large (1 inch) tube containing a Durham tube.
4. A large (1 inch) tube without a Durham tube.
5. A large (1 inch) tube, incubated in a sloping position.

6. A large (1 inch) tube, incubated in a sloping position and shaken frequently so as to change the air in contact with the surface.

Series A was inoculated with K 97, Series B with K 98, and Series C with K 98 (in each case 24 hours old on cooked meat). The tubes were examined three days after inoculation.

TABLE II.

No. of tube.	Series A.	Series B.	Series C.	No. of tubes fermented.
1	+	+	+	3:3
2	+	+	+	3:3
3	+	+	+	3:3
4	–	–	–	0:3
5	–	–	–	0:3
6	–	–	–	0:3

+ Indicates growth; – indicates no growth.

These experiments show that *B. welchii* prefers anaerobic conditions to those where air is present. When, however, the conditions are nominally aerobic but the organism can find a certain amount of shelter from oxygen, either by reason of the depth of the layer of liquid or other cause, development will take place. Once development has begun the dissolved oxygen of the liquid is swept away in the evolved hydrogen and carbon dioxide produced by the fermentation.

In order to ascertain whether *B. perfringens* could develop in a steady stream of air, the following experiment was devised.

A litre flask was taken and provided with a three-holed rubber stopper. Through one hole passed a tube on the outer end of which was a cotton-wool air filter. The end inside the flask was drawn out into a fine capillary. Through the second hole passed the inoculation tube, and through the third hole passed the air-delivery tube. 500 c.c. of the glucose peptone were placed in the flask, which was sterilised in the ordinary way. After sterilisation all joints were made tight with paraffin wax. The delivery tube was closed off with a sterile-air filter, and the contents of the flask inoculated with a young culture of *B. perfringens*. After inoculation the flask was incubated in a water bath at 37° C. The air filter attached to the delivery tube was then connected to an aspirator by which sterile air could be passed through the medium by way of the capillary. The air-supply was so regulated that about 300 c.c. of air passed through the medium per hour.

After 24 hours the medium was examined to ascertain whether fermentation had taken place. The liquid was only slightly clouded. The reaction of the liquid, as determined by the hydrogen electrode, was very slightly more acid. Analysis of the outgoing air showed it to contain more carbon dioxide than ordinary air. The percentage of oxygen was somewhat low, indicating the presence of a gas such as hydrogen. The liquid had fermented, although the fermentation was of a very feeble nature.

Data.—500 c.c. of glucose peptone, sterilised at 110° C. for 45 minutes. Incubated at 37° C.

Air drawn through at the rate of 300 c.c. per hour.

Absolute reaction before inoculation, $P_H = 6{\cdot}7$.

Absolute reaction after fermentation, $P_H = 6{\cdot}4$.

A control experiment made with the same apparatus, using 750 c.c. of nutrient medium, gave practically the same result. The amount of carbon dioxide formed during the 24 hours was about 50 c.c.

A glucose peptone experiment done under strictly anaerobic conditions will yield about 750 c.c. of gas per litre, and the fermented medium will have a reaction of about $P_H = 4{\cdot}5$.

Experiments with Other Strains.

In order to control the above results obtained with a single strain of *B. perfringens* which we had subjected to frequent transfers, we investigated five different strains of *B. perfringens* to ascertain if their behaviour towards air was the same. These strains were taken from cultures given us by Captain H. Henry, R.A.M.C., and included a strain marked "Pasteur," furnished by the Institut Pasteur of Paris.

The method of testing them was to prepare sets of tubes containing 2 per cent. glucose peptone water. The tubes were so selected that the bacteria, after inoculation, were submitted to conditions becoming less and less anaerobic. The different types of tubes used were:—

1. Small tube; with Durham tube; surface exposed to air, 2 sq. cm.
2. Small tube; no Durham tube; surface exposed to air, 2 sq. cm.
3. Large tube; with Durham tube; surface exposed to air, 7 sq. cm.
4. Large tube; no Durham tube; surface exposed to air, 7 sq. cm.
5. Large tube; incubated in a sloping position.

Five sets of such tubes were prepared, and each set was inoculated with three drops of one of the five cultures, three hours after these arrived in the laboratory. They were then incubated for 24 hours, after which time examination was made for growth.

Series A was inoculated with strain labelled "King, 10/5"; Series B with strain labelled "Pasteur, 10/5"; Series C with strain labelled "Benson, 10/5"; Series D with strain labelled "Bryant, 10/5"; Series E with strain labelled "Wills, 10/5."

The results are given in Table III.

+ Indicates growth; — indicates no growth.

It is seen from the above that the condition favouring growth is protection from air and a consequent low concentration of oxygen in the nutrient media. There is no essential difference in the behaviour of these organisms from the original ones with which we have worked. The strain which corresponds in every particular to our own is that of the Pasteur Institute.

It would appear, therefore, that with a medium favourable for growth the development of the organism is determined by a suitably low concentration of oxygen.

Remarks.

The solubility of oxygen in water is such that 100 c.c. of water saturated with oxygen gas dissolve about 2·5 c.c. at 37° C. (Fox). At 100° C. the solubility is decreased, so that only 1·7 c.c. are in solution. With air, which has a partial pressure of 20 per cent. of oxygen, only 0·5 c.c. is in solution, while at 100° C. that amount is probably about 0·37 c.c. This is not taking into account any decrease of solubility due to salts or soluble nitrogen compounds in the medium.

The situation, therefore, is this: that during sterilisation less than 0·37 c.c. of oxygen per 100 c.c. has been left in the medium. As the surface of liquid exposed to the air is small, and as convection currents of air and liquid are slight, the amount of oxygen taken up by the liquid from the air is very small. Hence the concentration of oxygen in the lower layers of the tubes is such that it does not interfere with the growth of *B. welchii*. As growth proceeds and gas is evolved, oxygen is driven out of the upper layers, so that finally growth takes place in all parts of the tube.

That a higher concentration of oxygen than that remaining after sterilisation inhibits growth is shown by a simple experiment.

If we saturate the medium with oxygen before inoculation no growth should take place. In order to test this, tubes were prepared of the same diameter containing the same medium. Under aseptic conditions oxygen was bubbled through the sterile medium. The oxygenated and the control tubes were inoculated at the same time. The oxygenated tubes produced no growth, whilst in the untreated tubes there was a vigorous growth.

Wright makes the statement that potato bouillon gives a much less vigorous growth when stale than when freshly prepared. The explanation for this is, in our opinion, that the "stale" tubes have had time to absorb sufficient oxygen from the air to inhibit growth.

It would appear, therefore, that with a medium favourable for growth the development of the organism is determined by a suitably low concentration of oxygen.

It is possible to test the conception of a region of diminished bacteriotropic pressure by doing away with this region. For this purpose we take the same medium, which

under certain conditions of oxygen tension does not grow the bacillus of Welch, and under lower oxygen tension produces a vigorous growth. This medium is inoculated, and during incubation a constant stream of nitrogen, containing 1 per cent. of oxygen, is bubbled through. The bubbling of a similar current of air containing 20 per cent. of oxygen inhibited growth. In the nitrogen tube a very vigorous growth takes place. Although we have prevented any segregation of bacteria, this has in no way inhibited growth, although a slight increase in oxygen tension does so.

Wright states that one

"must abandon the traditionary view that the growth of anaerobes pivots on the presence or absence of oxygen ..... and that the therapeutic principle of combating anaerobes by combating anaerobic conditions cannot be regarded in any sense as adequate."

This is a paradoxical statement which at once arrests and holds the attention, but the practical fact to be borne in mind is that the anaerobe is at once inhibited in its growth by the increase of oxygen tension above a very low level, and that its so-called aerobic growth depends on the establishment of conditions which maintain that low tension.

In connexion with the conditions which are usually associated with anaerobic technique it would appear that bacteriologists have been deluded for a long time into thinking that by covering a culture medium with a layer of paraffin or lanoline the aqueous layer is protected from the gases of the atmosphere. Vernon, as quoted by Bayliss in his "Principles of General Physiology," found that oxygen was 4·5 times more soluble in fats and oils than in water. Bayliss directs attention to the futility of attempting to protect aqueous solutions from the gases of the atmosphere by layers of oil, as is done in Hesse's method. The anaerobic conditions desired can be just as well obtained by employing *high narrow* tubes of freshly sterilised media.

We have made a certain number of experiments which confirm Bayliss's statement in every particular. Sloped tubes covered with paraffin do not grow the bacillus any better than do similar tubes unprotected by the fatty layer. If the paraffin layer is of any real value, it probably plays its part in diminishing convection currents in the aqueous layer.

Summary.

With a properly prepared culture medium, *B. welchii* will grow freely in open narrow tubes. The addition of any solid matter is not necessary to produce this apparently aerobic growth.

No segregation of organisms is necessary, for the bacillus grows vigorously when nitrogen containing 1 per cent. of oxygen is bubbled continuously through the tubes, but the organism is very sensitive to, and its growth is inhibited by higher proportions of, oxygen. For this reason the so-called aerobic growth is best obtained in narrow tubes of freshly sterilised fluid from which the air has been partly expelled by the heat of sterilisation.

TREATMENT OF WOUNDS BY A SOLUTION OF SOAP IN THE CASUALTY CLEARING STATION.

BY R. GARSIDE DIXON, M.B., CH.B. LEEDS,
AND
H. T. BATES, M.B., B.CH. DUB.,
CAPTAINS, R.A.M.C. (T.F.).
At a Casualty Clearing Station, B.E.F., France.

A SHORT time ago Colonel Cuthbert Wallace, A.M.S., brought to our notice that some French surgeons were using soap solutions in the treatment of wounds, and suggested that we should try this method.

During the last few months we have used this dressing on 68 cases. During the same period we have treated similar cases with other antiseptics, including eusol, hydrogen peroxide, and B.I.P.P., with the result that we are using more soap, and less of the other antiseptics.

A sample of common yellow soap was analysed and found to contain per cent.: Water, 24·6; fatty acids, 63·0; combined alkali, 4·6; free alkali, nil; impurities, 7·8. This was considered suitable, and it was found possible to make a 5 per cent. solution of it.

The first cases tried were small open muscle wounds in which there was no gas gangrene. After being opened up, and metal and cloth removed, the wounds were dressed with sterile gauze soaked in this solution. The dressings were left undisturbed for two, three, or four days, provided there was no rise in temperature. At the first dressing the most striking features were less pain, the unusually clean appearance of the wound, absence of pus, and the redness of the whole of the tissues—the muscle in particular.

Encouraged by the success in regard to small wounds, we tried the same treatment in larger and deeper wounds, using Carrel's tubes in the ordinary way. Here we found a difficulty with the common soap solution; it was found to be too gelatinous to flow at all well down the tubes. A 2½ per cent. solution of the B.P. soft green soap was then tried, and found to be quite satisfactory.

The results continued to be most encouraging, and compound fractures of the bones of the hands and feet, also the long bones, including the femur, were so treated successfully. Cases of penetrating wounds of the knee-joint were treated by this method, the joints being irrigated and the capsule and external wounds closed. The cases did very well.

In cases of gas gangrene the results were usually good, but in one case (buttock) a gelatinous film or glaze was formed over the affected muscles, and the treatment had to be discontinued in favour of hydrogen peroxide.

In the case where a man had similar wounds of both calves the soap solution with Carrel's tubes was tried on one side, and another antiseptic, also with Carrel's tubes, on the other. Both wounds did well, but the side treated with soap was not dressed as frequently as the other side, and when the patient went to the base his soap-dressed wound looked more like a granulating wound, and more like one that it would be safe to close than the other.

The points claimed for the soap solution dressings are that they clean up a wound quickly, the dressings are much less painful than ordinary dressings, there is a saving of labour as the dressings need only be changed every three or four days, the solution is easily procured, easily made, and cheap.

Soap Dressings.

Compound fractures—		Vessels	17
Fractures	83	Nerves	6
Partial fractures	22		

Notes of Cases.

CASE 1.—Gunshot wound of left arm, compound comminuted fracture of humerus. Date of wound, July 1st, 1917. Re-dressed eusol, dressing requiring surgical treatment. Injection of antitetanic serum, first, 750 units, on the 1st. Morphia gr. ⅓ 12 o'clock same day. Relg. C.E. At 3 P.M., pre-operation hypodermic injection of atropine gr. 1/100, operation by Captain Dixon; anæsthetic, closed ether, Captain Lloyd. A large portion of the biceps and triceps muscles was excised. A large piece of isolated bone was removed as well as dirt and khaki cloth. Six Carrel tubes were inserted; soap dressing; Thomas splint. The temperature rose to 102·8° F. on the evening of the second day, was not above 100° after the third day, and fell to normal by the seventh day.

CASE 2.—Date of wound, June 28th, 1917. Compound comminuted fracture of left humerus. 29th: Antitetanic serum, 500 units; morphia gr. 1/4 and atropine gr. 1/100 at 2.30 A.M. Operation by Captain Dixon at 3.30 A.M. Anæsthetic, closed ether, Captain Lloyd. Loose bone removed; hæmorrhage arrested; Thomas splint; soap dressing: three Carrel tubes. The temperature slightly subnormal after operation, gradually rose to 102·8° F. by the 30th, thereafter ranging from 102° to just above normal until July 8th. On the latter date it was 100·4° in the evening.

CASE 3.—Gunshot wound of left leg; compound comminuted fracture of tibia and fibula. Operation on June 20th, 1917. Wound opened up. Three pieces of shrapnel removed, also a piece of isolated bone. Wound swabbed out with soap solution and sutured. Soap solution. On the 20th the temperature was 100·6° F. After this it ranged between 100·4° and normal, being 100° ou the 27th and normal on the 28th.

CASE 4.—Multiple shell wounds; compound comminuted fracture femur; under care of Captain Bates. Patient admitted at 1.30 P.M. on —— 28th; temperature 100°. Morphine 1/4 gr. hypodermically. Operation; Carrel-Dakin tubes, soap solution. On the 29th the temperature rose to 101·8° and on the 30th to 103·6°; oleum ricini given. Temperature normal on morning of 31st, rising to 102·6° in evening. Wound dressed. From —— 1st to 4th temperature swinging from 102·2° to 100°. On 4th wound dressed. On the 5th temperature lower; urine tested and found normal. On the 7th wound dressed; antitetanic serum 500 units; temperature 100·8°. Then up to the 18th the range was between 100° and subnormal; and on the 11th patient taken to theatre at 6 P.M. Morph. tart.

CASE 5.—Compound comminuted fracture of right femur; secondary closure; soap solution; under the care of Captain Bates. The temperature on May 24th was subnormal; 25th–29th, from 101·4° to 99°; May 30th–June 12th, 99·8° to 97·4°; June 13th, 100·4°; 14th–25th, 99° to 96·8°; 26th–28th, 99·4° to 97°.

PROCIDENTIA RECTI AND ITS TREATMENT.

BY DOUGLAS DREW, B.S. LOND., F.R.C.S. ENG.,
SURGEON TO THE HOSPITAL FOR WOMEN, SOHO.

UNDER the title of prolapse of the rectum are included conditions differing widely pathologically and clinically. On the one hand, there is the condition where the loose mucous membrane is extruded as a ring generally only when there is an action of the bowel; this condition is usually caused by the straining of chronic constipation, and is frequently associated with internal hæmorrhoids. On the other hand, and it is of this condition that I wish to speak, the whole rectum is thrust completely outside the anus.

Description of Condition.

The protrusion varies from 4 to 7 or more inches in length and is about 2½ to 3 inches in diameter at its base; one of the most striking features is the remarkable degree of dilatation of the anus, the external sphincter being completely paralysed, so that if the mass is reduced the anus remains in a very patulous condition. The mass presents the transverse folds of the mucous membrane, with the opening of the bowel at its apex. The mucous membrane may be normal in appearance, or inflamed and ulcerated from friction if it is constantly down; the patient's state is then pitiable in the extreme, there is a profuse discharge of mucus with tenesmus and the frequent passage of a small amount of fæcal matter.

The manner in which the bowel is extruded through the patulous anus is of importance as indicating the nature of the morbid process; it will be noticed on asking the patient to strain that it is the lowest part of the bowel that comes down first, whereas if the condition were due to an intussusception or invagination at a higher level, the lowest part of the mucous membrane would be the last to come outside, and then only in extreme cases.

Although procidentia is met with not infrequently in weakly children with chronic diarrhœa, it is by no means the formidable affair that it is in the adult, and with few exceptions is readily cured. I shall refer later to the treatment of these obstinate cases in children.

In all the cases that have come under my observation the patients have been women, otherwise healthy, between the age of 35 and 50 years (except one aged 27), and in most a similar history was obtained—"that the condition had existed for years," "as long as I can remember," or "since childhood."

Causation.

A great deal has been written on the causes of procidentia recti and procidentia uteri. That the determining factors are not the same I think there can be no doubt, for whereas the latter condition in its various degrees is extremely common, the former is a rare condition. I have only met with 7 cases in the course of more than 18 years at a women's hospital. Nor do we find the two conditions usually associated. I have, however, placed on record the remarkable case of a young woman of 27 in whom both conditions existed in a marked degree, and Lynch recorded a similar case in a woman of 71 years[1]; doubtless similar cases could be found in aged patients in those storehouses of pathological curios, the Poor-law infirmaries.

Further, the trouble is not limited to those who have borne children. Two of the cases recorded in this paper had not had children. That complete rupture of the perineum is not sufficient to produce procidentia of the rectum is also evident. I have seen patients in whom a complete rupture of the perineum had existed for years, and although the mucous membrane of the rectum was extensively exposed there was no falling of the rectum.

The essential condition for the occurrence of procidentia in the absence of any condition which drags or presses the bowel down appears to be undue mobility of the rectum either as a congenital defect or from stretching of the supporting structures. I recently performed hysterectomy (Case 5) for menorrhagia due to a fibroid, when I found that the mesentery of the pelvic colon and sigmoid were of unusual length; that of the former being fully 4 inches long at the bottom of Douglas's pouch, and as not more than 5 inches of the prolapsed rectum had been removed there was no doubt as to its unusual length, which I regard as a congenital abnormality.

The history, as I have already pointed out, is suggestive that in most of the cases the trouble had existed in childhood, and in one case it was definitely so stated; so that I am inclined to regard these cases as instances of the condition in childhood persisting into adult life, and consider that they are brought about by overstretching of the supporting structures of the rectum in early life.

Treatment.

I have operated on quite a number of cases in children in which, in spite of careful treatment extended over a long period, the bowel continued to come down. These inveterate cases are best treated by drawing down the prolapse to the fullest extent and excising a wide ellipse of the mucous membrane extending from the anal margin to the apex of the prolapse and suturing the edges with catgut sutures, which are embedded in the wall of the rectum, so that as they are tied the rectal wall is pleated; the procidentia is then pushed back and the bowels are kept confined for a few days, with precautions against straining when they are allowed to act. This operation, which is easily performed and entirely devoid of risk, is in my experience uniformly successful.

Many operative procedures have been practised for the cure of procidentia in the adult, and from their number and variation, apart from definite evidence of failure, it is suggestive that none of them are very reliable in effecting a cure. It is, perhaps, only necessary to mention, in order to condemn such methods as scoring the mucous membrane with the cautery or with a cauterising acid, these methods are in no way curative and only cause additional suffering.

Various plastic methods have also been devised. By those who regard the condition as a hernia from the pouch of Douglas the method of inserting rows of purse-string sutures in the peritoneum of the pouch of Douglas (through an abdominal incision), so that when they are tied the pouch is obliterated, is utilised. I have no experience of the operation; but if the view that I have advanced that the trouble is due to abnormal mobility of the rectum is correct, it would appear that an operation of this nature would not suffice to prevent the bowel from slipping down.

Other surgeons, by a transverse incision between the anus and the coccyx, have exposed the posterior wall of the rectum and have inserted a series of sutures into it; the ends, after reduction of the bowel, are passed through the skin on each side of the sacrum, and are tied over a pad of gauze in this position.

Ball, after opening the abdomen, drew up the prolapsed rectum until it was taut; an incision was made in the peritoneum of the left iliac region and the bowel sutured to the fascia and muscle, the peritoneum being stitched to the bowel. I have adopted this method on one occasion, in the case of the young woman referred to, in whom there existed complete procidentia recti et uteri, the latter being at the same time fixed by ventrifixation; in this case the result was satisfactory, until after a second parturition, subsequent to the operation, when the uterus began to come down again, and there was also a slight tendency to prolapse of the bowel again. Tuttle performed a similar operation, but attached the sigmoid to the anterior abdominal wall.

It is, I believe, generally admitted that all these methods at times fail to effect a permanent cure, just as similar operations on the uterus are by no means uniformly satisfactory; we have, however, at hand another method which, I believe, is invariably successful—i.e., excision of the whole mass with suture of the bowel to the skin.

I have now performed this operation on six occasions, details of which are given below, the earliest as long ago as 12 years, and I have been able to keep some of the patients under observation and to be able to judge how satisfactory are the remote results; not only is the prolapse permanently cured, but what is even more important is that the overstretched sphincter gradually recovers its power, although a considerable interval may elapse before this is complete.

That the operation is of a rather formidable nature must be conceded, and it may be that this cause together with the risk of sepsis have deterred surgeons from largely practising it. It is surprising, however, how slight the

[1] New York Medical Journal, 1909.

disturbance is, the patient convalescing as rapidly as after a Whitehead's operation for piles. The danger of sepsis has also been overrated; in the six cases that I have operated upon four healed per primam; in one there was a little suppuration, and a small abscess discharged at the posterior anal margin, but very little delay was occasioned, as the wound was healed in three weeks. In only one case was there any real trouble from this cause, in which an abscess formed in the recto-vaginal septum and discharged into the bowel; in this case suppuration continued for some months and eventually necessitated a further operation for the cure of what was practically a blind internal fistula.

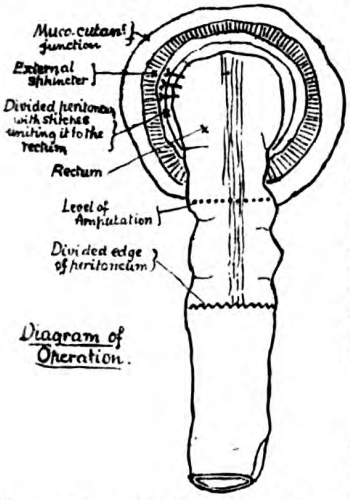

Diagram of Operation.

Three sutures only are shown uniting the peritoneum to the rectal wall. A continuous suture is usually employed.

Description of Operation.

In performing the operation it is important to be expeditious, particularly in the early stages, as bleeding is rather copious. An incision is made completely round the bowel at its junction with the skin, as in Whitehead's operation. The mucous membrane is dissected up and the stretched sphincter is defined and separated from the mass from above down, the muscle fibres being carefully preserved. Having secured the many bleeding points, the incision, at a distance of 1 inch from the skin, is deepened through the wall of the bowel till the peritoneum is reached and opened transversely. Forceps are applied to the anterior edge of the peritoneum and a piece of gauze is inserted into the opening to prevent the intestine from prolapsing and blood from entering the cavity. The remainder of the circumference of the wall of the rectum is then divided and the vessels in the mesorectum secured. The invaginated portion of the bowel can then be turned downwards so that the mucous membrane becomes internal.

Having drawn down all the slack bowel, I apply a rubber-covered clamp to it and cut the mass away by dividing the bowel below the clamp at the level at which it is to be stitched to the skin. The amount removed varies from 5 to 15 inches. The next step is to suture the divided peritoneum to the drawn-down bowel at about 2 inches above its divided end, and this is facilitated by the clamp, which not only holds the bowel securely but arrests the bleeding from the cut end and prevents the escape of any contents.

This being completed, the final step of the operation is to suture the cut edge accurately to the skin. This I find is more readily accomplished by stretching the lumen of the bowel gently and then inserting four sutures at the four opposing points of the circumference. These sutures should be passed deeply, passing outside the external sphincter and through the skin so that when they are tied the sphincter is approximated to the bowel; each quadrant is then accurately adjusted to the skin.

Notes of Cases.

CASE 1.—Aged 41, married, no children. Was admitted to the Hospital for Women in 1905. Twenty-one years before she had had an operation for the cure of the trouble. Control of the sphincter returned within five weeks of the operation under faradic treatment. This patient has been under constant observation since 1905. She returned some three years after with a large fibroid, for which a total hysterectomy was performed. Some year or so later she again returned with a ventral hernia owing to suppuration of the abdominal wound at the time of the hysterectomy and again two years later with acute appendicitis, requiring immediate operation.

This patient, who was last seen in 1916, has had no further trouble with the rectum. There is complete control of the sphincter, and on passing the finger into the rectum all that can be felt is a linear scar about ½ an inch inside the anus.

CASE 2.—Aged 39, married, eight children. Admitted in 1905. The trouble had existed for many years. 7 or 8 inches of the bowel came down; 15 inches were removed. Paralysis of the sphincter persisted for a long time after the operation.

CASE 3.—Aged 49, married, one child. Admitted in 1912. The history states that the trouble had been present two years only; the protrusion was 15 inches in length. In this case slight suppuration occurred.

CASE 4.—Aged 38, married, no children, admitted in 1915. Prolapse had been present nine years and was very painful to replace. In this case the incision around the mass was made at ¾ inch above the cutaneous margin. There does not appear to be any advantage in making the incision in this position; in fact, the hæmorrhage in this case was unusually severe.

CASE 5.—Aged 36, unmarried. Seen in consultation with Dr. Savill, of Bexhill in 1915. The trouble had been present for many years. It was in this case that troublesome suppuration arose in the recto-vaginal septum, necessitating a further operation some months later.

CASE 6.—Aged 46, married, two children. Admitted in 1917. The trouble had existed for years. The uterus was at a low level, but it was situated in a forward position.

CASE 7.—Aged 27, married, one child. This case, which had existed since childhood, was recorded in THE LANCET* and was treated by fixing the rectum in the left iliac region and the uterus by ventrifixation. This patient has since had two normal confinements at Queen Charlotte's Hospital. There was a return of the falling of the uterus after the second, and the patient stated that there was a tendency to a return of the rectal trouble, but I could not get her to extrude any bowel on examination.

Wimpole-street, W.

REPORT ON

EXAMINATIONS OF FÆCES OF CHINESE LABOURERS.

BY F. B. BOWMAN, M.B. TOR.,
MAJOR, C.A.M.C., O.C., NO. 2 CANADIAN MOBILE LABORATORY;
AND
P. D. SAYLOR, M.D.,
CAPTAIN, C.A.M.C.

(*Report to the Medical Research Committee.*)

As numerous reports at different times have shown that Chinese are largely infected with intestinal parasites, it was decided to carry out an examination of several hundred Chinese labourers. These men had nearly all come from Northern China, and a recent report[1] has shown that a large percentage of the people of Southern China are infected with the "hookworm." The question as to the possibility of these northern Chinese being infected arose, and the possibility of their spreading this infection. It was also decided to examine the stools of these men for the presence of typhoid or paratyphoid organisms.

Procedure.—To obtain the specimens a small cardboard plate was given to each man, and he was instructed to defecate upon it at the latrine. A small portion of fæces was then picked up with the small spoon supplied with the specimen bottle, and placed in the bottle, which was then tightly corked. These bottles had been sterilised previously. The sample was then taken to the laboratory for examination. Only 25 were collected each day, for comparatively little time could be spared for this work without interfering with the necessary routine work of the laboratory. For bacteriological examinations the technique outlined by one of us[2] was used—i.e., Endo's plates, followed by Hiss sloped-agar tubes, and later agglutination of suspicious cultures.

To make the examination for ova in the specimens as regular as possible only one preparation from each was made and examined unless the first one was entirely unsatisfactory. It is probable that a much higher percentage of infections would have been found had several slides from each specimen been examined.

It was hoped to examine 1000 men indiscriminately, but as they were detained sometimes for a few hours only before going overseas it was impossible to carry this out without extending the work over a long period of time. The results of the examination of 340 specimens is considered of sufficient interest to be reported. A table is attached which

Table showing Percentages of Parasitic Infections Found.

Diagnosis.	Number of infections.	Percentage.
Ascaris lumbricoides	225	88
Ankylostoma duodenale...	38	11
Oxyuris vermicularis	7	2
Strongyloides stercoralis...	3	1
Trichiuris trichiura...	15	4

* THE LANCET, 1913, ii., 136.

[1] Journal of A.M.A., June 23rd, 1917, lxviii. (No. 25), 1888.

[2] Brit. Med. Jour., August 25th, 1917.

shows the different infections present with percentages. It may be noted that no *tænia* infections were found The sputum of several cases showing a considerable amount of blood was examined for paragonimus ova with a negative result.

The specimens were not examined carefully for amœbæ unless blood and mucus were present. Only two cases of amœbic dysentery were found and these were acute, and the stools, which were very frequent, contained very large amounts of blood and mucus.

Bacteriological examination of 340 stools showed the presence of paratyphoid A in two of them. The men had no symptoms.

Summary.

The importance and seriousness of hookworm infection as a predisposing cause of many seemingly unrelated acute infectious diseases is well known.

Foster and Sinclair in a recent article[3] declare that among certain Alabama troops on the Mexican border, where 39·9 per cent. of the men were infected with hookworm, the high mortality from infectious diseases was undoubtedly due to this infection.

In California rigid quarantine measures are taken with immigrants from the Orient, and all are examined, among other things, for the presence of hookworm infection before being allowed to proceed.

It is stated by Rosenau[4] that in Bilibid Prison, Manila, P.I., when the Americans took it over the death-rate was 234 per 1000. This high percentage by ordinary sanitary measures was reduced to 75 per 1000, and it was only when the hookworm question was investigated and prisoners were thoroughly treated for this condition that it was reduced to 13·5 per 1000. A large number of these examinations at Bilibid Prison were made by one of us (F B. B.) while on the staff of the Bureau of Science, Manila, and the comparatively sudden change from a high to a low mortality rate was notable.

The ease with which the infection spreads in non-infected districts is remarkable, and if the percentage of infection among 340 Chinese examined indiscriminately is any indication of the total number of infections among them, among 100,000 there will be at least 10,000 "soil polluters."

The winter and early spring are the seasons when pneumonia, measles, &c., appear, and the possibility of these diseases appearing among the Chinese is not remote. Hookworm infection should be taken into account as a devitalising agent, and thus a predisposing factor in the seriousness of these conditions.

Conclusions.—1. Parasites are common in the fæces of Chinese labourers. 2. Hookworm infection is very prevalent and calls for attention. 3. Paratyphoid A carriers may occur among the Chinese.

Note.—During the month 39 naso-pharyngeal cultures were made from Chinese, and 2 were found positive for meningococci. Agglutination tests proved one to be type I., the other type II.

Incidental expenses connected with this inquiry have been defrayed by a grant from the Medical Research Committee.

THE LATE MR. ETHELBERT HOSKING, M.R.C.S. ENG., L.S.A.—Mr. E. Hosking, who died at his home at Turner's Hill, Sussex, on Oct. 22nd, was, until a few years ago, one of the best-known practitioners in North Sussex, where he had practised for over a quarter of a century. A son of Professor William Hosking, Professor of Architecture at King's College, London, he was born in London on Nov. 17th, 1846. He was educated at King's College School and received his medical training at King's College Hospital, qualifying in 1871. In the following year he was appointed resident medical officer at Bloomsbury Dispensary, and from 1874 to 1880 was assistant medical officer at the Surrey County Asylum at Tooting. For a time also he was assistant house surgeon at Salop Infirmary. Afterwards he went to Turner's Hill where he soon gained an extensive practice and took up several public appointments, among them being that of medical officer of St. Saviour's Middle Class School at Ardingly. He retired in 1912, and was then placed on the commission of the peace for the county. He married Annie Sophia, daughter of Dr. Nance, of Eccleshall, Staffordshire, and his widow survives him.

MEDICAL SOCIETY OF LONDON.

Resumed Discussion on the Value and Limitations of Sanatorium Treatment for Tuberculosis.

A MEETING of this society was held on Nov. 19th, Sir STCLAIR THOMSON, the President, being in the chair, when the discussion on the above subject was resumed.

Sir R. DOUGLAS POWELL said that he was impressed by Dr. Lister's warning against the tendency to exaggerate the direct agency of infection in the production of tuberculosis. If there were no dirty surroundings and bad habits of life the infection of tuberculosis would almost cease to be operative. The ultimate object of all treatment of tuberculosis was to help the patient to secure immunity, and by immunity he meant a power of resistance amounting to a safeguard against fresh attacks of the disease. Some patients would acquire immunity without any orthodox direction or treatment, post-mortem observations revealing many such cases. Some attained a practical immunity who could by no means be regarded as cured of pulmonary tuberculosis. He had seen many people with considerable lesion in one lung for many years with chronic cough and expectoration, more or less bacillus-laden, who seemed immune from fresh attack, and ultimately died of some other disease, amongst which cancer and some gouty affections would, he thought, be found relatively prevalent. The disease in such cases was localised and circumscribed by fibrosis. Many cases did well without sanatorium treatment; the margin of difference in favour of sanatorium over general hygienic management was much less defined than one might expect. On the whole his firm opinion was that sanatorium treatment was, without doubt, the best, not only in the interests of the community but in properly chosen cases, also of the individual patient. He thought it would be advisable to have more subdivisions in sanatoria and suggested (1) a hospital department for acute cases requiring constant nursing, care, and medical treatment; (2) a department for advanced cases; (3) a sanatorium proper with full equipment for cases selected from the two preceding and for incipient and quiescent cases in which immunity was in sight; athletic and industrial exercises would be provided in this department; (4) associated bungalows and chalets in groups for convalescent and after-care cases. Referring to the value of after-treatment, he thought that the patients' prospects depended largely on their own intelligence and care, but also on the conditions of life to which they returned. He thought insurance might help, and that some arrangement might be made whereby employees, when definitely attacked with tuberculosis, should receive a certain portion of their insurance money which would enable them to undergo prolonged sanatorium treatment, and then seek a more outdoor and healthy occupation.

Dr. ARTHUR LATHAM said that both the public and the profession paid too much attention to the infectivity of the disease. The von Pirquet test showed that 2 per cent. of children of 2 years had had tuberculosis, 55 per cent. of those of 15 years, and pathologists said that by the age of 30 every man and woman had evidence of tuberculous trouble. Few could say that a patient had contracted the disease from a certain person, as might be said with regard to scarlet fever, for example. If the defence was undermined by definite factors the disease immediately became active. These factors were *strain* and *stress*. The increase of tuberculosis during the war could not be explained by increased infectivity, but could be explained by the increased strain and stress. He thought sanatorium treatment was the best we had; it regulated the daily stress and exercise. We should not fill our sanatoria with those who had a right to be there, but with those who would do well. We could only remove the disease by removing the strain and stress of working people; until this were done the results would be as unsatisfactory as at the present time.

Sir ARTHUR NEWSHOLME said that during 1916 there were 53 000 deaths due to tuberculosis in this country. Sanatorium treatment was but a link in the chain of measures of treatment. The first was *notification*, which was enforced in 1908. By this means (*a*) the medical officer of health

could get control of the environment of the patient; (*b*) light was thrown on the influence of alcohol, as to whether it (1) increased the opportunities for infection or (2) lowered resistance; (*c*) coöperation between the medical officer of health and the private practitioner was possible. The work of the tuberculosis officers was of value in consulting with the general practitioner and in examination of contacts. By examining the relatives it was often possible to get cases early. Sanatoria were of great value educationally, diminished tendency to relapse, prolonged working life, and decreased the danger to the public. Patients often did extremely well in huts in the back garden; it was better for the patients and safer for the families. The selection of cases for sanatorium treatment should be on purely medical grounds. Infectivity and environment were factors which worked together; both were necessary to the production of disease. The resistance and the dosage varied. He considered massive infection of more importance than the other speakers had done. The object of treatment was the expeditious recovery of the patient and the prevention of infection of others.

Dr. J. J. PERKINS spoke of the causes of the failure of sanatorium treatment. I. Cases of tuberculosis were not sent up at a sufficiently early stage. Sometimes diagnosis was delayed and milder measures were first tried; sometimes—from kindness—the patient was not told of his illness in plain terms. Early diagnosis was required, early speaking out, and the insistence on adequate early treatment. He had seldom met with a refusal to enter a sanatorium when it was possible in the early stages confidently to hold out hope of recovery. He suggested that we should push our diagnosis further back, and send not only patients with tubercle bacilli in sputa to a sanatorium but especially the cases of early hæmoptysis, the tubercular pleurisy, and the case of progressive emaciation and debility, with some pyrexia but few physical signs. II. Further limitations were to be found in the environment to which the patient returned. He hoped much from change of occupation to an outdoor life which the more intelligent should be able to make. The National Association for the Prevention of Consumption was founding a colony with the intention of giving these men a thorough grounding in the various branches of outdoor and farm work in the hope of enabling them to settle on the land.

Dr F. R. WALTERS was firmly convinced of the great value of sanatorium treatment. The only question was as to how far it could be replaced with advantage by dispensary or home treatment. Restoration to health in a sanatorium was usual if the case was suitable and the treatment early, thorough, and prolonged. Suitable cases were those with limited lesions, only moderate constitutional disturbance, no serious complications, originally fairly good constitution, and without history of massive or virulent infection. It was not usually possible to keep a non-wealthy patient in a sanatorium until he was cured. Three or four months might be needed before graduated exercise was even begun. Relapses were usually caused by disregard of simple rules of life, by late application for treatment, or by premature return to unfavourable conditions. To prolong the sojourn under more favourable conditions health colonies were needed. He called attention to the need for physiological subdivisions, according to febrility and exercise capacity, under the purely anatomical groups, as done in the Surrey County Council statistics. From these it appeared that if patients applied for treatment before they had lost their full working capacity, two-thirds would be fit for full work 12 months later, whereas of those who waited until they were feverish five times fewer would have full working capacity a year later. Physiological disturbance was of more importance in prognosis than anatomical extent of the lesion. Shorter expectation of life in the tuberculous did not show that sanatorium treatment was useless—it might result from a poor constitution quâ tubercle, or from unsatisfactory after-conditions. Dr. Walters urged the importance of prompter and more systematic treatment of the febrile tuberculous; health colonies to bridge the gap between sanatoria and full work, more universal training in sanatorium ways, and greater continuity of treatment.

Dr. B. A. RICHMOND said that he had urged the Bermondsey borough council to take municipal beds for the treatment of tuberculous patients. During 1911–12–13 15 cases were sent to the Maitland Sanatorium. In June, 1914, only seven deaths had been reported. Three cases were in close touch with the medical officer four years after discharge from the sanatorium. In each case the occupation had been changed. According to the medical officer's opinion the great difficulty lay in the inability to get suitable occupation, two to three months being spent in a state of semi-starvation looking for work at a time when good food and care were required. The way to keep up the immunity gained in a sanatorium was to improve the social condition of the patient so that he could take advantage of the education received there. There was need to awaken the interest of practitioners in this work. The value and limitations of sanatorium treatment should be settled, and it should be made clear that everyone was not suitable for sanatoria and that the sanatorium was only one link in the chain.

Mr. H. KINGSLEY WOOD, chairman of the London Insurance Committee, said that this was not a single but a mixed problem, and together with housing, maternity and child welfare, &c., must be treated as part of the great problem of national health. Until there was a Ministry of Health to coördinate all authorities the money now spent was largely wasted. Short periods at a sanatorium were useless; the patient returned to a worse stress than when he left.

The Right Hon. C. W. BOWERMAN, M.P., secretary of the Trades Union Congress, said that all were aware of the great value to workmen of sanatorium treatment. If those skilled judges, men in charge of institutions, were enabled to follow men discharged as cured or nearly cured into their ordinary domestic surroundings, one of two things would happen—their hearts would be broken or they would help to form a band of men determined to improve the housing accommodation in this country.

The discussion was adjourned till Nov. 26th, when Dr. A. NIVEN ROBERTSON, Dr. G. A. CRACE-CALVERT, Dr. W. CAMAC WILKINSON, Dr. D J. CHOWRY-MUTHU, Dr. HENRY ELLIS, Dr. JANE WALKER, Dr. JOHN SORLEY, Dr. H. J. CARDALE, and Sir WILLIAM OSLER will take part.

Reviews and Notices of Books.

1. *Physical Remedies for Disabled Soldiers.* By R. FORTESCUE FOX, M.D. Lond. With 3 plates and 84 illustrations. London: Baillière, Tindall, and Cox. 1917. Pp. 277. Price 7*s.* 6*d.* net.
2. *Massage: Its Principles and Practice.* By JAMES B. MENNELL, M.A., M.D., B.C. Camb. With 135 illustrations. London: J. and A. Churchill. 1917. Pp. 259. Price 8*s.* 6*d.* net.

1. IN the past the various physical methods of treatment, massage, manipulations, exercises, baths, heat, light, electricity, have been left very largely to the specialist, the methods adopted and the results attained being comparatively unknown and unrecognised by the profession at large. Too often the treatment has actually been left in the hands of the unqualified practitioner of the particular physical method, without even expert direction by a medical man. The inevitable result has followed. Hospital departments for physical treatment have in many cases become the dumping ground for chronic, difficult, and often hopeless cases, so that these branches of work have not attracted the best assistants, and the work has become discredited. Claims have been made that are not justified by results, and in many cases the whole system has tended to develop into quackery. Physical treatment early came into prominence in the surgery of war. First it became obvious that a very large body of masseuses would be required; these have been obtained and their work has been invaluable. Then, first in France at the Grand Palais, physical remedies of all sorts were collected together and utilised as combined methods of treatment on the same patient, a rational course which has been still further rationalised in the orthopædic hospitals in this country by the combination of physical methods of treatment with surgical clinics in the same institution. Dr. Fortescue Fox was responsible for a campaign which ended in this extension of the combined method of physical treatment to England. His book is welcome as giving a brief but clear and rational exposition of the various physical

methods, their indications, and the results to be expected so far as our present experience goes. Dr. Fox has himself written the section on hydrological methods and most of the remainder of the book, but he has been assisted by such authorities as Professor Tait McKenzie on mechanical methods and exercises, Dr. J. B. Mennell on massage, and Dr. F. Hernaman-Johnson on electrical treatment. Naturally in such subjects, which are comparatively new to the profession at large, there will arise criticism of detail. For example, the mechanical exercisers, usually named after Zander, which Dr. Fox describes, have found but few advocates in this country. But it is only right that the knowledge of these methods should be widely diffused, so that everyone may try them and form their own conclusions, and Dr. Fox makes no miraculous claims for any method but only asks for their trial.

2. Massage has few text-books in this country, and perhaps not one that is really first-class. Dr. Mennell's book should fill a long-felt want. It treats of massage as it should be treated, as a means to an end. Massage in the treatment of injuries is only a step towards the attainment first of passive then of active movements, leading on finally to treatment with active exercises with or without apparatus. Dr. Mennell deals with it in this spirit, he devotes a considerable space to treatment by exercises, and he describes his apparatus, which is certainly a model of compactness and at the same time of simplicity. In this work again there is room for criticism, and it is to be hoped this will come. It is time that the whole profession studied massage; it can be studied in theory in Dr. Mennell's book, a practical observation of patients under treatment and of results will then lead on to the formation of individual opinions, not upon the value of "massage" as a therapeutic method, but upon the value of the different methods included under this generic term.

Experimental Pharmacology. By DENNIS E. JACKSON, Associate Professor of Pharmacology, Washington University Medical School, St. Louis, U.S.A. London: Henry Kimpton. Pp. 536. Price 20*s*.

TWENTY years ago laboratory instruction in the medical schools of the United States was confined to the departments of anatomy and pathology, except in one or two of the most advanced centres. How far medical education has progressed from the didactic lecture which then formed the staple of instruction is shown by this elaborate description of the technique of pharmacological experimentation. The author gives no less than 158 experiments, more than one half of them on mammals, which may be used to elucidate the action of drugs; not all of these are intended to be given in any one course, the instructor is given a wide choice of illustration. The directions are simple, accurate, and detailed, so that the student can readily follow them; some of them may appear a little startling in present conditions, as where the student is advised to give a dog half a pint of cream as a preliminary to the study of the lymph circulation. Many of the more difficult operations are obviously intended to be demonstrated by the teacher rather than performed by the student himself; for example, few students can be expected to insert cannulæ into the thoracic or the pancreatic duct without much previous experience in operations of this kind. In this country this manual can hardly be used by students under the regulations on experiments on animals. But it may be highly recommended to teachers of pharmacology, for it offers a wealth of experiments which may be used to illustrate lectures, and the care with which these are described renders it easy to perform those which may be selected. It deserves attention also from investigators in the fields of physiology, pharmacology, and pathology for its review of reliable methods and for many useful hints drawn from the author's experience. It contains nearly 400 illustrations (24 full-page colour plates), some of which are superfluous, but others presenting the anatomical relations and the successive steps of the operations are extraordinarily useful. As examples the series of drawings of the exposure of the salivary ducts and nerves may be cited. When these are compared with the single woodcut which is generally supplied of the operation, the advance may be appreciated. Altogether this book promises to lighten the labours of many teachers, and will prove almost indispensable in laboratories of experimental research.

The Method of Enzyme Action. By JAMES BEATTY, M.A. M.D. Dub., D.P.H. London: J. and A. Churchill. 1917. Pp. 143. Price 5*s*. net.

THE hypothesis put forward by the author in these pages as to the mode of action of enzymes has at least the merit of simplicity. Without dealing completely with his summary given in the last section of the book, we may say that his general conclusions is that the whole of the chemical action of enzymes may be reduced to the action of hydrogen and hydroxyl, and this, he adds, is to be expected, as the two substances everywhere present when life first developed were water and air. The use of enzymes, he continues, is to control the rate and the sphere of naturally occurring reactions. The former is secured by increasing the number of the active H and OH radicles; the latter by limiting them to definite points to which the substrate of the reaction is also attracted. It is suggested that in the light of his hypothesis it ought to be possible to manufacture enzymes by adapting the constitution of any given enzyme to a congenial substrate or environment. Dr. Beatty's work should attract the attention of all workers in this field. It is a most interesting contribution on the subject that invites many directions of research, whether it does or does not some day culminate, to use the author's last words, in "the synthesis of life itself."

New Inventions.

THE ADMINISTRATION OF SALINE SOLUTIONS.

Lieutenant-Colonel P. Fiaschi, A.A.M.C., has called our attention to a method for the rapid intravenous administration of prepared sterile saline solution, or of sterile gelatin saline solution (Hogan's solution), in the field. "The difficulties of preparing a surgically perfect saline solution," says Lieutenant-Colonel Fiaschi, "and of being able to rapidly give this intravenously to a number of cases demanding such a procedure, either during the rush of an engagement, or even to a few cases in periods of comparative quiescence in the fighting sector, are reserved only for those of us who have attempted this rational and physiologic method of treatment on the Egyptian Desert, at Gallipoli, or at the Somme." By his method the solution is supplied in bottles with automatic stoppers, each holding 500 c.c., together with a siphon and intravenous cannula apparatus. These are shown in the illustration. The bottle is warmed to blood heat in a basin of water, the stopper removed, and the cannula apparatus fitted to the mouth of the bottle. The solution is allowed to flow through the cannula by inverting the bottle. The method of use is quite simple, and it is easy to double the quantity of fluid administered by using two bottles in place of one.

The sterile saline solutions (0·9 per cent. sodium chloride in glass-distilled water) and sterile gelatin saline solution (gelatin 2·5 per cent., sodium chloride 0·9 per cent., sodium carbonate 0·2 per cent.) in bottles with automatic stoppers, autoclaved (15 lb. pressure for one hour), are prepared by Messrs. Burroughs, Wellcome, and Co., who supply one siphon and intravenous cannula apparatus to each six bottles.

DEVON AND EXETER HOSPITAL.—At the last meeting of the governors of the Devon and Exeter Hospital it was reported that the deficit balance against the charity now amounted to £2100; the President (Sir E Chaning Wills) gave £500 towards reducing this deficiency. Two years ago Sir E. Chaning Wills gave £1000 for the funds of the institution.

CUPRASE

For the Medical Treatment of CANCER.

Clinical facts carry greater weight than theoretical deductions. Doctors of repute in various countries give cases of great variety. In all of these **pain has been eliminated,** and in a good percentage **cures are claimed,** in no instance **any undesirable effects.** It should be remarked that all or nearly all the observations refer to inoperable cases in which the prognosis was unfavourable at an early date. It is needless to emphasize the practical importance of a preparation capable of yielding such results, even relative, in the worst stages of a disease which has always been regarded as absolutely resisting the action of all internal remedies.

Nothing has been found which can compare with the effects produced by means of Cuprase.

Its **easy application** (subcutaneous injections) places it within the reach of all practitioners. **It is not toxic.**

Cuprase is a colloidal Copper hydroxide obtained by the reduction of Salts of Copper in the presence of Albumosic Acid.

Disappearance of the Pain.

Return of Sleep.

Increase of the Appetite,

Colour and Strength.

WARWICKSHIRE, July 1st, 1917.

DEAR SIRS,—Will you please send me another box of Cuprase ampoules. The previous lot effected a most remarkable cure in an elderly lady suffering from cervical cancer — the cauliflower-like growth has disappeared with its offensive discharge.

This case was given three months' life by a Specialist, being inoperable.

Yours faithfully,
(Signed)
G—— B——, M.R.C.S., L.R.C.P.

Dr. GAUBE DU GERS' Cuprase is administered in subcutaneous injections made *very slowly* in the gluteal region, with a needle of about 0·03 cm. at the rate of an ampoule every four days, which should be continued in the same manner as long as necessary. These punctures are not generally painful and do not produce any local reaction.

LITERATURE and CLINICAL REPORTS to the PROFESSION on REQUEST.

THE ANGLO-FRENCH DRUG CO., Ltd.
(LATE M. BRESILLON & Co.),

'Phone: HOLBORN 1311. **Gamage Building, Holborn, London, E.C. 1.** Telegrams: "AMPSALVAS, LONDON."

OPOLAXYL

Rational Treatment of CONSTIPATION.

By the double action of secretions and peristalsis.

Opolaxyl is a combination of the secretions of the liver (biliary), pancreas, and intestines, with vegetable extracts of non-drastic nature.

It combines all the secretions to correspond to nature's therapy and promotes a flow of bile and glycogen.

It is a normal regulator of the gastro-intestinal functions; consequently it improves the metabolic exchanges of the entire organism.

Opolaxyl does not lose its efficacy by prolonged use; its effect is gentle and constant, with the least irritation. It is not merely purgative; it stimulates the defective organs and revives the normal equilibrium; it has a lasting effect because it builds the organs, thus correcting diminutional action.

Opolaxyl is put up in small size tabular form and should be swallowed without crunching at bedtime or before breakfast.

DOSE—For obstinate constipation 2 or 3 tablets, afterwards a tablet every 3 or 4 days for a month.

E———, Scotland, 9th Oct., 1917.

DEAR SIRS,—Having derived considerable benefit from the use of Opolaxyl tablets in my own personal case, I write as a practising physician to ask if you would make any reduction of price in the event of my sending you an order for a fair quantity, say, one dozen bottles.

Yours faithfully,
C. A——, M.D.

URASEPTINE

The Most Powerful and Effective Urinary Antiseptic.

URASEPTINE is a granulated product entirely soluble in water, its bases being **Piperazine, Urotropine, Helmitol, Benzoates of Sodium and Lithium.** It contains 60 centigrams (10 grs.) of active matter to each teaspoonful.

DOSE.—2 to 6 teaspoonfuls daily.

It purifies the Urine, and this action is due to its three principal properties:

1. **It is a URINARY ANTISEPTIC.**
2. **A SOLVENT of URIC ACID and of PHOSPHATES.**
3. **A MILD NON-TOXIC DIURETIC.**

INDICATIONS.—**Arthritism, Gout, Gravel, Hepatic and Renal Colic, Rheumatism, Calculus, &c., Phosphaturia, Urinary Antisepsis, Pyelitis, Bacteriuria, Cystitis, Prostatitis, Urethritis, Pyuria, Urinary Abscess, Vesical Catarrh, &c.**

LATAPIE
SERO-REACTION FOR SYPHILIS

Simplified Wassermann Test of the Pasteur Institute.

The Latapie method, which only requires **three** test tubes, has marked advantages over other methods. It simplifies the technique and makes errors almost impossible. This statement is based upon extensive practical experience embracing more than 100,000 examinations conducted at the Pasteur Institute (since 1908), with blood collected at the Institute itself or sent in from outside sources.

ACCURATE—RELIABLE—UNCOMPLICATED—ECONOMICAL.

The Antigen is supplied in tubes, which is diluted 22–26 times (according to indications on each tube). It keeps good and fully active for several years if kept at room temperature and protected from light.

Full and Complete Instructions with each Tube.

Recurrent Fever
SYPHILIS

GALYL

Frambœsia
Sleeping Sickness

3000 Injections (intravenous) were given in one of our **Service Hospitals.**

"No case has given the slightest cause for anxiety, and the clinical results are very satisfactory."
Staff Surgeon's Report.

GALYL is as effective as SALVARSAN or NEOSALVARSAN on Spirochætes and Trypanosomes, more rapid in action, and free from the neurotropic and congestive action of these preparations.

FOR INTRAVENOUS INJECTIONS:—
(1) **DILUTE.**—**GALYL** is supplied in neutral glass ampoules containing the necessary dose of Sodium Carbonate, sterile distilled water only being used for the dissolution.

(2) **CONCENTRATED.**—A special outfit containing one dose GALYL, one ampoule sterilised solution, and one small filter is supplied.
DOSES.
0·10—0·15—0·20—0·25—0·30—0·35—0·40.

(3) FOR INTRAMUSCULAR INJECTIONS:—
GALYL is supplied in **GLUCOSE SOLUTION.**
DOSES.
0·10—0·15—0·20—0·30—0·40

THE IMPROVED INTRAMUSCULAR INJECTION.

A STABLE SOLUTION *NOT* an Emulsion.

The GALYL is in the form of a Sodium Salt in a weak solution of Glucose. This is much easier to use and more rapidly absorbed than the oily emulsion. It is in every way identical with the intravenous—efficacy, dose, price, &c., only differing in administration.

Thorough and exhaustive tests in various parts of the Kingdom have proved it to be equal in every way with the intravenous; moreover, patients may resume and continue their occupations without inconvenience after injection of intramuscular Galyl.

BURNS
VARICOSE ULCERS
RHEUMATISM
NEURITIS

AMBRINE

(The only Authorised Preparation of Dr. Barthe de Sandfort. Various Imitations compel us to make this statement.)

GOUT
NEURALGIA
CHILBLAINS
SCIATICA

The most efficient means and method of ensuring active **Hyperthermal-Therapy** to the practical treatment of **Burns, Varicose Ulcers, Rheumatism, Gout, Arthritis, Neuralgia,** and similar affections.

Although the dressing with AMBRINE is occlusive and adhesive, it becomes after a short period non-adhesive, and can be removed without pain, hæmorrhage, or injury to the newly forming tissues. The healing takes place without leaving scars or contraction.

May be applied with a camel-hair brush, but our specially designed spray greatly facilitates the application of Ambrine, especially in the case of wounds or extensive surfaces.

THE LANCET.

LONDON: SATURDAY, NOVEMBER 24, 1917.

The Value of Sanatorium Treatment.

SANATORIUM treatment has now been on trial in this country for about a generation, and there has been time to form a considered opinion upon its merits. Although the debate at the Medical Society of London on the Value and Limitations of Sanatorium Treatment, begun on Nov. 12th, was again adjourned on the 19th, it was evidently the conviction of a large proportion of those taking part in it that sanatorium treatment, whatever its limitations, is the best treatment that we yet have for early pulmonary tuberculosis. The immediate results under favourable conditions are obviously very good, as seen in the summary given by Dr. DAVID LAWSON last week of a thousand cases on the point of leaving his care at Banchory. Of these, 53 per cent. had appreciated during sanatorium treatment to the extent of probable arrest of disease, and a further 27 per cent. had definitely improved. Dr. W. O. MEEK, whose paper we publish in full this week, finds equally favourable results in the different class of patient for which Frimley Sanatorium provides. Given a reasonable selection of cases for treatment, he finds the response and the immediate result to be almost uniformly good.

But, except in the case of the well-to-do, the immediate effect of sanatorium treatment gives no trustworthy indication of the ultimate result. Professor SIMS WOODHEAD and Mr. VARRIER-JONES, in a communication to our columns this week, express the fact in exact terms when they state that the well-to-do person has three times more chance of keeping sound after treatment than has the working-man. Recognition of this fact has, indeed, resulted in certain quarters in branding the sanatorium treatment of the working-classes as a complete failure. But figures based on sound clinical observation and analysed on logical methods must replace general impressions. Dr. NOEL BARDSWELL has compared the prospect of life of sanatorium patients, as they leave Midhurst Sanatorium, with the actuarial expectation of life for a healthy person at the same age. He finds that in first-stage leavers the prospect of life was about one-sixth, and in second-stage leavers about one-twentieth of the normal expectation. The calculation is a novel and useful one, but Dr. BARDSWELL pointed out himself that the comparison should in fairness be made with the prospect of life for the tuberculous patient *not* undergoing sanatorium treatment, but the figures for such an analysis, however, are not available. Although Dr. MEEK did not put the Frimley figures into similar form, he gave a most instructive comparison between two series of leavers with apparently equal prospect of maintaining their health. In the one case the patients returned to their former occupation in and about a large city, and of these 30 per cent. were well and at work two years later. Of the second group, who changed their environment in accordance with the advice given to them, 80 per cent. were continuously well and at work after the same period. Sanatorium treatment cannot fairly be judged apart from what precedes and what succeeds it. It has been described as one link in a chain of remedial measures, or, in the language of metaphor, as a stanza in the lullaby which tuberculosis sings from the cradle to the grave. All that can fairly be expected from sanatorium treatment is that it shall teach to those who are experiencing it the hygiene of the healthy life, and shall raise for a brief period the resistance to the disease which has been lost under unfavourable circumstances. Nothing can prevent a return to the environment which produced the disease from leading to a renewed breakdown.

Sanatorium treatment is therefore bound up so closely with after-treatment that the two cannot in any useful sense be considered apart, and where efficient after-care is lacking no result can be expected. Conditions in London are especially disappointing, and the two distinguished laymen who contributed to the adjourned discussion of this subject at the Medical Society last Monday were not impressed by the value obtained in London from expenditure on sanatorium benefit. One described it as so much money thrown away, and both urged upon their hearers the necessity of drastic reform in the environment of the working-classes. An increased hygienic standard for town life is essential to maintain the immunity acquired during sanatorium treatment, and will, as Dr. T. D. LISTER pointed out trenchantly in opening the debate, largely avoid the necessity of sanatorium treatment at all if it is applied in advance. Do away with dirty surroundings and bad habits of life, Sir DOUGLAS POWELL put it, and the infection of tuberculosis would almost cease to be operative.

Georgian Medicine.

GEORGIAN medicine, especially the theory and practice of our science and art during the half century when GEORGE III. was king, formed the interesting subject chosen by Dr. ARNOLD CHAPLIN for the FitzPatrick lectures delivered last week before the Royal College of Physicians of London. In giving the chief reasons which had determined this selection Dr. CHAPLIN stated that the reign of GEORGE III. witnessed the last struggle of Feudalism to control the acts of mankind, and the dawn of those conceptions of civil, intellectual, and religious freedom under which we at present live. This, of course, is substantially true, though a good many vested abuses remained to be dealt with in Victorian days, nor is the victory over them yet complete. Between the general conditions of intellectual advancement and the special progress taking place in medicine at the close of the eighteenth and beginning of the nineteenth

centuries Dr. CHAPLIN instituted a just parallel, describing the movements in which mere speculation gave place to inquiries which, founded on a true basis, became steps towards scientific freedom. But advancement in medical knowledge which gave such promise at the end of the seventeenth century, for some reason, not easily explained, slumbered for the first half of the eighteenth century, and enthusiasm was only rekindled by the work of HALLER, MORGAGNI, and BAILLIE, whom Dr. CHAPLIN regards as the real founders of modern medicine.

The numerical strength of medical men resident in England and Wales was computed by Dr. ARNOLD to be something under 5000 at the end of the eighteenth century, from which figures, which he submitted as quite rough, it would seem that the proportion of medical men to population has not much varied. The control exercised over them by the Royal College of Physicians of London, the Company or Corporation of Surgeons, and the Society of Apothecaries was capricious, stringent in many ways, and inefficient in others. The passing of the Apothecaries Act in 1815 placed a considerable portion of the medical profession under the ægis of an Act of Parliament, and from this time conditions arose which made the standardising of professional knowledge, and the institution of some professional body to undertake such work, a foregone conclusion. Soon it was seen that the facilities existing in England for the acquirement of medical knowledge were good if properly used. In this part of the lecture the scope of education at the Universities and in London was given in detail, and it was shown how extensive was the standard of culture expected of those who intended to become physicians. The curriculum at the London hospitals and private schools in the metropolis was discussed, and an account was given of the rise of dispensaries, 23 of which were founded during the reign of GEORGE III. Space was also devoted to a consideration of the activities of the various medical societies established during the reign, several of which are in existence at the present time. Following on the above, a detailed account was given of the great contest in the College of Physicians between the Fellows and the Licentiates, and from Dr. CHAPLIN'S learned picture there emerges the definite impression that those of us who regard the medical profession of a century ago as either ill-trained or unprogressive hold a quite unsound opinion.

In the second lecture the individual work of physicians who contributed to the advancement of medical knowledge was considered. After giving some account of the sources from which information concerning the activities of individual leaders could be gleaned, Dr. CHAPLIN showed that for the first 30 years of the reign of GEORGE III. physicians were purely clinicians, and relied entirely upon knowledge of disease gained at the bedside. As types of these clinicians, the characters and work of HEBERDEN, Sir GEORGE BAKER, and Sir HENRY HALFORD were described at some length. But towards the end of the eighteenth century the clinicians had reached limits beyond which it was almost impossible to advance, and were compelled to make way for men who, in addition to being possessed of clinical knowledge, had brought to their aid the chemistry and physiology of the day, which were already shaping into scientific pathology. These sciences, owing respectively to work by HALLER, MORGAGNI, and later BAILLIE, to whose names that of LAVOISIER should be added, had already been placed upon a sound basis, and were in a position to lend their aid to practical medicine. The first to make use of the newer methods was MATTHEW BAILLIE, the father of medical pathology, but he was soon followed by WILLIAM PROUT, who applied the lessons of chemistry to the elucidation of medical problems. After the work of these men medicine was able to make rapid strides, and the logical sequence of their efforts found expression in the brilliant discoveries of the modern clinicians, of whom BRIGHT, ADDISON, WATSON, and JENNER were the prominent examples selected by Dr. CHAPLIN for mention, as well as ROBERT WILLAN, who founded the modern school of dermatology. The position of obstetrics during the reign of GEORGE III. was very interesting. Most of the activity in this branch of medicine was due to the teaching of SMELLIE, although the influence of THOMAS DENMAN, WILLIAM OSBORNE, WILLIAM HUNTER, and DAVID ORME played a considerable part. Strong feeling was excited among the public by the introduction of "men midwives" into this department of medicine, and it lasted in England down to the time of WILLIAM IV., in spite of the fact that on the continent the work of obstetrics had been in men's hands many years.

In Dr. CHAPLIN'S summary of the work of those physicians who contributed most to the advance of medical science during one of the longest reigns in our history, he has employed as outstanding examples the characters and work of THOMAS YOUNG, WILLIAM HYDE WOLLASTON, and WILLIAM CHARLES WELLS. In the lectures to be delivered next year quite other medical protagonists should obtain mention, for the subjects to be considered will be the rise and development of the Army and Naval Medical Services and the care of the insane. We are glad that such particular attention was paid to the work of WELLS, both as a physician and a man of science, for his valuable contributions to medicine and natural philosophy have been somewhat neglected. The claim for WELLS as one of the foremost intellects of the reign has much to support it. In the domain of medicine his papers on the presence of albumin in the urine and his able differentiation of the several forms of dropsy certainly paved the way for the great work of RICHARD BRIGHT. We owe to his researches, also, the first exact explanation of the phenomenon of dew.

Dr. Marcus S. Paterson, medical director of King Edward VII. Welsh National Memorial, has resigned his appointment on account of illness. We are glad to learn that he is now recovering his health.

Dr. Edward Burd, who died last week at his residence, Newport House, Shrewsbury, at the advanced age of 91, was a well-known consultant in the West of England, and the first man to take the degree of Master of Surgery at Cambridge.

Annotations.

"Ne quid nimis."

PRISON DIET.

REPLYING to a question in the House of Commons on Oct. 25th, the Home Secretary alluded to the revision of the prison dietary which had been carried out with a view to economy in the use of foodstuffs. He added that the effect of the new diet was being carefully watched by the medical officers of the prisons, who freely used their power to supplement the diet in case of necessity. We understand that the calorie value of the diet works out in round figures as follows: In local prisons, for males, 2900; for females, 2500. In convict prisons, for males on ordinary labour, 3200; on very hard labour, 3500; for females, 2650. The record of body-weight which is being kept will afford a ready criterion as to whether the diet results in a satisfactory equilibrium under the conditions of prison life. It may be recalled that the generally accepted standard of diet for an average man doing an average day's work is 3400 calories, but in making a comparison between this standard and the figures given above for prison diet two points should be borne in mind. In the first place it is doubtful whether there are actually 3400 calories available at the present time for every member of the community. And secondly, the prison figures are to be taken as the caloric value of the food *as eaten*, whereas in the other case the value is for food *as purchased*. Langworthy has given a round figure of 15 per cent. for the depreciation in caloric value between the purchased food and the quantity which passes the lips, although in these days of economical cooking and well-tidied plates the discrepancy is probably less. In neither the one nor the other is allowance made for the indigestible portion of the food which passes the alimentary canal unchanged, and is variously reckoned as from 5 to 11 per cent.

A SWISS CANCER INVESTIGATION.

THE council of the Swiss Association for Combating Malignant Disease has addressed a circular to the Swiss doctors calling attention to the conspicuously high incidence of cancer in Switzerland and to the fact that nothing is yet known either as to the cause of the disease or the explanation of its special prevalence in that country. The council therefore asks for precise statistical and clinical information in regard to all fatal cases of cancer of the breast. Special notes are requested, first, of the influence of lactation, mastitis, or previous innocent tumours (fibro-adenoma, cysts) on the development of cancerous growth, and, secondly, of the effect on prognosis of operation, Roentgen rays, or radium applications. This inquiry will be based on the death certificates sent in to the Statistical Department. Similar information is also requested in regard to patients still living at the end of 1915 who had been under treatment for mammary cancer during the preceding five years. A modest honorarium of 2 francs is offered for each schedule thus filled in, and the association hopes to obtain statistical material which may lead to the formation of some useful opinion. Switzerland has, as is well known, the highest cancer death-rate in the world, although alone among civilised countries the rate is a diminishing one. Inspection of all dead bodies by a medical man is compulsory in Switzerland, and this may to some extent account for the highness of the death-rate in cancer. Any proposal to amplify the statistical information on cancer in that country is valuable and welcome, and the selection of mammary cancer for intensive study is a wise one. The frequency of operation, with its accompanying accuracy in pathological diagnosis, secures a firm objective basis for the data, and the points selected for the questionnaire are precise and well selected. The demarcation of urban, industrial, and pastoral communities in the population is definite and should enhance the value of the results obtained.

THE TREATMENT OF WAR NEUROSES.

WE publish in another column a letter from Dr. Thomas Lumsden, bringing to the attention of the medical profession a scheme for the treatment of shell-shock patients which he has already placed, in something the same form, before the general public in the columns of the *Times*. Under this scheme, known as the "Country Host Institution," neurasthenic patients of suitable character would be billeted on country hosts upon the usual terms of 3*s*. per diem, pay and separation allowances being drawn. The patients, whom Dr. Lumsden suggests should be mild sufferers from shell shock, would be carefully selected and regularly inspected, so that in event of breakdown or illness they could be transferred to hospital. The idea of thus getting separate attention for a certain class of sufferers from shell shock in suitably peaceful environment has already received, Dr. Lumsden points out, an optimistic reception from the President of the Special Medical Board on Neurasthenia, and has been promised a trial by the highest military authorities, and he begs that medical men who are in sympathy will put themselves into communication with him. There can be no doubt of the medical endorsement of the scheme whatever. Granted that it can be made to run, it would prove veritable salvation to some of these patients; and we may assume that its unqualified rejection, if Dr. Lumsden is correct in believing that such rejection has occurred, has been owing to practical difficulties of organisation, or doubt as to whether the large amount of help needed would be forthcoming.

LUPUS PERNIO.

Lupus pernio is one of the rarer diseases of the skin, so-called, and was first described by Besnier in 1889. He believed it to be a vascular form of the commoner lupus erythematosus, judging from clinical grounds. Subsequent investigators set it down among the group of cutaneous tuberculides; the tubercle bacillus itself has, apparently, never been found in the lesions of lupus pernio. Dr. Jörgen Schaumann has recently published[1] an elaborate study of the histology and bacteriology of the disease, and he gives good reasons for supposing that it is not associated with tuberculosis at all. Contrariwise he connects it with another rare skin disease, the cutaneous sarcoid of Boeck (1899), which may be identical with "Mortimer's malady" described in 1898 by Hutchinson; both lupus pernio and Boeck's sarcoid of the skin are now said by Dr. Schaumann to be evidences of one

[1] Nordiskt. Med. Arkiv, Stockholm, 1917, Afd. II., xlix., Häft 6.

and the same disease, a "tuberculoid lymphadenia," characterised by the appearance of specific lesions in the lymphatic glands, tonsils, bone marrow, lungs, spleen, and liver. He goes on to say that this tuberculoid lymphadenia has no connexion with tuberculosis or with any other known infection, which makes one wonder why he attaches to it the misleading name "tuberculoid." He further proposes to call it "lymphogranuloma benignum," a benign infectious granuloma. The chief novelty of Dr. Schaumann's work appears to lie in the fact that he has made elaborate histological and bacteriological and skiagraphic researches on his three patients with lupus pernio and his single case of Boeck's sarcoid, with the result that he has found out what previous investigators have missed—namely, that the lesions in these diseases are far more widespread than was hitherto suspected. The cutaneous lesions are in reality of secondary importance in the disease, appearing, perhaps, only late in its course, and yielding to treatment, while the characteristic deposits in the lymphatic glands or lungs or liver persist unaltered. These deposits are similar, in the case of the lymphatic glands at any rate, to those in the cutaneous lesions, and consist of follicles filled with epithelioid cells and giant cells, surrounded by lymphoid and plasma cells. The fingers in lupus pernio often present the outward appearance of tuberculous dactylitis, as is well known; but in the former disease the X rays show patches of bony rarefaction at the ends of the phalanges, whereas in tuberculous ostitis the lesions tend to occur rather in the middle of the phalanges and to cause a swelling of the bone absent in lupus pernio. And these bony changes may occur in lupus pernio before the cutaneous lesions. In none of Dr. Schaumann's patients did tuberculin injections (up to 15 milligrammes) give rise to any focal or general reaction; and he failed to produce tuberculosis in experimental animals by inoculation with fresh granulomatous tissue taken from his patients. Bacteriological cultivations made from the glands and cutaneous lesions yielded him diphtheroid bacilli, streptothrices, and staphylococci; he attaches no etiological importance to any of these organisms, pointing out that similar growths have been obtained from the cutaneous lesions in leprosy and other affections.

THE PREVENTION OF NUISANCES ARISING FROM FLIES AND PUTREFACTION.

THE results of a series of investigations on the prevention of nuisances arising from flies and putrefaction are recorded in a valuable paper contributed to the October number of the *Journal of Hygiene* by Mr. F. W. Foreman, F.I.C., and Dr. G. S. Graham-Smith. The findings in all directions are in favour of the use of coal-tar creosote oil of "country make." Thus, for killing eggs or larvæ in their breeding grounds the authors find coal-tar oils, and especially creosote oil, to be most satisfactory reagents. Flies sprayed with these oils are killed, and they are repelled from substances which attract them, such as decaying bodies and fæcal material, and they are kept out of habitations by means of the repellent constituents of coal-tar oils. In regard to the treatment of decomposing carcasses, coal-tar creosote oil gives the most satisfactory results in practice and exhibits most of the properties required of such a reagent for the purpose. It is pointed out that in the superficial treatment of intact or opened carcasses, and other putrescible materials, reagents should be used which adhere to the greasy surfaces. Films are so formed rendering the skin waterproof and killing the bacteria in it, thus checking putrefaction by preventing the access of water and putrefactive bacteria to the tissues. The reagent should also be capable of eliminating any stenches which may arise, repelling flies, killing the eggs or larvæ, resisting the action of water, and remaining operative in all respects for a long period. Watery emulsions of disinfectants appear to be deficient in most of these properties, and only undiluted oily reagents possess them. In their chief conclusions the authors state that experiments with the bodies of horses show that they behave in the same manner as those of smaller animals, and can be efficiently treated in the same way. A body was preserved by surface treatment alone for a long period, and produced no appreciable nuisance from smell. For large carcasses relatively less fluid is required for surface treatment owing to the smaller ratio of surface to weight. The treatment of human bodies under war conditions has given satisfactory results. Flies have been kept from entering such places as dug-outs by hanging sacks treated with creosote oil mixtures over the entrance. Adult flies in dug-outs and other situations and on putrescent material are killed by spraying. Latrines have been kept free from flies by spraying. The paper contains full instructions for using the creosote oil mixtures, and the research has evidently led to some important practical issues.

THE PRESCRIBING OF COCAINE.

MORE than a year ago[1] we called attention to the Defence of the Realm Regulations with respect to the sale of cocaine, and although these Regulations have now been in force for more than 15 months, there is evidence that practitioners are not all cognisant of the bearing of them. At a recent prosecution of a pharmaceutical chemist convicted of dispensing cocaine contrary to the Regulations, and fined £25 on each of two counts, it was stated that in the one case the prescribing doctor failed to comply in every material respect with the Regulations, and in the other in two important respects. The defending solicitor contended that the doctor, although not summoned, was the person mainly responsible in both cases, and that the chemist had committed only technical irregularities. It may therefore be well to recapitulate here the Regulations, which are both stringent and precise.

A medical man who writes a prescription of which cocaine is one of the items must:—

(1) sign it with his full name, his address, and his qualifications,

(2) write the date upon it,

(3) mark it with the words "Not to be repeated,"

(4) specify the total amount of cocaine to be supplied;

and further, in the case of a practitioner who dispenses his own medicines, he must

(5) enter the ingredients of the prescription with the name and address of the person to whom it is supplied in a special book open to inspection.

The only exceptions to these instructions are: (1) where the medicine to be supplied is a proprietary one, it is sufficient to state the amount of the medicine and not the total amount of cocaine it contains, and (2) in the case of prescriptions written on Health Insurance forms, the practitioner's address and qualifications, and the words "Not to be repeated" need not be marked on the prescription. It should also be added that prescriptions containing less than one part of cocaine per thousand do not come within the scope of the Regulations.

However troublesome the carrying out of this routine may be to the practitioner, he has no

[1] THE LANCET, August 5th, 1916.

alternative but to comply. Even if the chemist takes the responsibility of dispensing a prescription not in accordance with the Regulations, the practitioner is not legally protected, inasmuch as under the Code, as consolidated and revised to Sept. 30th, any medical practitioner giving a prescription otherwise than in accordance with the provisions shall be guilty of a summary offence against the Regulations and is therewith liable to any penalty up to penal servitude for life. Should the Regulations be found to press hardly upon patient and doctor in material respects it will obviously be more expedient to make representations in the proper quarters, rather than to take the serious individual risk of infringing the Regulations.

ENLARGEMENT OF THE SUPRARENAL GLANDS IN A CASE OF DIABETES.

THE current view of the pathology of diabetes is that the disease is due to failure of the internal secretion of the pancreas, which is in some way necessary for the normal metabolism of carbohydrates. But the internal secretions of other glands —adrenals, thyroid, and posterior lobe of the pituitary—are known also to play a part in carbohydrate metabolism, and administration of their extracts produces glycosuria. This is generally regarded as due to an antagonistic effect on the internal secretion of the pancreas. However, in diabetes little is known of changes in glands other than the pancreas. In the *Medical Journal of Australia* Mr. W. F. Litchfield and Mr. E. M. Little have reported the following case:—

A widow, aged 53 years, was admitted into the Royal Prince Alfred Hospital, Sydney, under the care of Mr. Morton, on Feb. 22nd, 1917, for gangrene of the big, second, and third toes of the left foot. She had suffered from thirst and a large appetite for eight months. The urine contained sugar and albumin, and had a specific gravity of 1030. She was fat and had a profuse growth of hair on the chin. On the 27th the affected toes were amputated, and on March 20th the foot was amputated on account of recurrence of gangrene. The stump did not heal well and ultimately became gangrenous. A large bedsore formed over the sacrum. She became thinner and weaker, and died comatose on April 11th. The necropsy showed hypertrophy of the left ventricle and atheroma of the aorta and of the coronary arteries. The pancreas was atrophied and hard. The kidneys appeared normal, except that the vessels were rigid. The suprarenals were much enlarged, particularly the left, one end of which was large and globular, suggesting a new growth. The pituitary appeared normal. Under the microscope the kidney showed fibrosis and thickened vessels and the pancreas a fine fibrosis of the whole gland. The islands of Langerhans were present in normal numbers. The suprarenals showed an increase of glandular substance, which appeared to be chiefly in the cortical portion. Nothing abnormal was detected in the pituitary gland.

The outstanding features of the case were the association with diabetes of hypertrophy of the suprarenals and pronounced arterio-sclerosis. Were these correlated in any way? It is established that adrenalin in excess in the blood mobilises the sugar stored in the liver, and also that it constricts the small arteries. Professor Halliburton thinks that "the action of the pancreatic hormone is best explained on the hypothesis that it acts as a natural antagonist of adrenalin," and that when the pancreas is diseased or removed "the action of adrenalin is unrestrained, and thus a diabetic condition is produced." Mr. Litchfield and Mr. Little suggest that in their cases some agency brought about hypertrophy of the suprarenals and that the consequent increased secretion of adrenalin caused arterio-sclerosis, from prolonged constriction of the small arteries, and induced diabetes and ultimately fibrosis of the pancreas from overwork of the organ in its vain attempt to counteract the excessive secretion of adrenalin. But the cause of the adrenal hypertrophy remains unexplained. According to this view pancreatic diabetes would be primarily an adrenal disease. In his work on the "Internal Secretions" Biedl states that many writers have observed hypertrophy of the suprarenals, sometimes of the cortical substance and sometimes of the chromaffin substance, in cases of arterio-sclerosis, and that some have attempted to show a connexion between chronic renal disease and overaction of the adrenal system. The case now reported is an important contribution to the new and fascinating field of the pathology of the internal secretions.

THE BRITISH MARRIAGE-RATE AND THE WAR.

THE Presidential address of Sir Bernard Mallet, the Registrar-General of Births, Deaths, and Marriages, delivered on Tuesday last at the Royal Statistical Society, dealt in a valuable manner, because of his clearness, with those large questions of racial advance or decline which may dictate the fate of the world at the close of a devastating war. On the subject of the marriage-rate of this country he was particularly interesting. For England, Scotland, and Wales he indicated that a fortunate rise in marriage-rates has taken place, though this rise appears to have been in continuation of one which had already become apparent before the war broke out. The marriage-rates were not, as a matter of fact, increased at first by the outbreak of war, but at the beginning of 1916 occurred a sudden rise, due to marriages contracted by young soldiers in an army which was rapidly nearing its present immense size. The rise was not continued throughout the year, but has had its effect. Sir Bernard Mallet's summary of the actual figures shows that 200,000 people in England and Wales have been married between August, 1914, and June, 1917, who in the ordinary course of events would not have been married; the corresponding figure for Scotland he puts at 8000, while in Ireland the number of marriages has remained fairly constant, not appearing to be materially greater than the normal in the period from August, 1914, to June, 1917. These British figures Sir Bernard Mallet finds to be in complete contrast with those prevailing in Germany, and for the contrast he gives two reasons. The first is that an enormous German Army, being thoroughly prepared, rushed on to foreign soil at the outbreak of war, while the bulk of the British Army remained for some time under training at home, so that the men enjoyed opportunities for marriage that were largely denied to the German Army. The rise in our marriage-rates being practically dependent upon the size of the Army, the second reason for its occurrence has been the payment of substantial separation allowances and pensions. The effect which has already been produced by the war marriages, or rather by the abnormal number of marriages which took place in the year ending March, 1916, has had a real influence, at any rate for the time, in arresting the decline of births, which has been a feature in the statistical records of all civilised countries for some years. It is of good omen to learn that this decline has not affected the United Kingdom to anything like the extent to which it has affected Germany and Hungary.

IRELAND.

(FROM OUR OWN CORRESPONDENTS.)

The Queen's University of Belfast.

AT a meeting of Senate, and at a meeting of Convocation, of the Queen's University of Belfast held separately on Nov. 16th, resolutions were unanimously passed with the object of putting forward a claim to Parliamentary representation under the scheme for redistribution of seats in Ireland. Committees were appointed to make representations to the Government.

Child Welfare in Portadown.

The fine residence, erected some years ago in Portadown by Miss Carleton, has most generously been handed over by that lady to the town of Portadown to be used as a centre in association with the maternity and child-welfare scheme adopted by the urban council and the local nursing society.

Ulster Medical Society.

At the opening meeting of the winter session the incoming President, Dr. W. Donnan, of Holywood, co. Down, delivered an address on Chemical Physiology. A discussion arose on the attitude of the public health authorities to the schemes for venereal treatment, and the following resolution was unanimously passed:—

That in the opinion of the Fellows and Members of the Ulster Medical Society it is inadvisable that any public health scheme for the treatment of venereal diseases shall be adopted until it is first placed before the medical profession of the affected area for consideration and discussion—the practice which has been followed by Local Government Boards in England and Scotland.

It was noted that in regard to the child-welfare scheme put forward by the health committee of the Belfast Corporation, and subsequently approved by the Local Government Board, the local medical profession had never been consulted.

Tuberculosis in Belfast.

A report has just been issued by the chief tuberculosis officer of Belfast for the three years ended March 31st, 1917, on the scheme of the Belfast Corporation for the Treatment of Tuberculosis. In the last annual report of the Irish Local Government Board this is described as "the most comprehensive scheme in Ireland and one of the most complete in the United Kingdom, providing, as it does, for institutional, dispensary, and domiciliary treatment, not only for all insured and exempt persons, but also for all residents in the city suffering from tuberculosis." The cost of the scheme for the third year under review amounted to just over £30,000. Commenting on this expenditure, the tuberculosis officer writes: "Judged by the standard of death-rate, one might feel inclined to say that it had failed," for, in 1916, the death-rate from pulmonary tuberculosis apparently remained stationary in Belfast—namely, 2·0 per 1000. But claim is made to valuable results in individual cases, in more accurate diagnosis, in prolongation of life, and in rest and education. It is to be hoped that further statistical reports will show a distinct fall in the mortality of pulmonary tuberculosis, for only so can the large outlay on such a scheme be justified to the lay mind.

The Late Dr. William Graham.

Dr. W. Graham, superintendent of the Belfast Lunatic Asylum, whose sudden death, on Nov. 6th, was due to cardiac embolism, secondary to a fracture of the neck of the femur, was a native of co. Antrim, and educated at Queen's College, Belfast, graduating M.D. R.U.I. in 1882. He succeeded the late Dr. Merrick in 1895 as superintendent of the Belfast Asylum, retaining this position until his death, when he was the senior asylum superintendent in Ireland. An acute clinical observer, Dr. Graham was also a remarkable organiser, who got the best work out of all those associated with him. The new asylum at Purdysburn, Belfast, with its villa colony system and its non-restraint method of treatment, was largely a product of his initiative. For some time he had held the rank of lieutenant-colonel in view of his appointment as head of the hospital in Belfast for soldiers affected with mental disease.

The Ballinrobe Guardians and their Medical Officers.

The state of affairs at Ballinrobe continues to be one of considerable importance to members of the Irish Poor-law service. The guardians and their medical officers are still at loggerheads. Sir J. Acheson MacCullagh, M.D., senior medical inspector, Local Government Board, attended a special meeting of the guardians on Monday and urged a friendly settlement on the point of salaries. The doctors, at the request of the County Association and the Local Government Board, withdrew their resignations, while the guardians, in a manner regarded here as typical, refused to make any advance and declared that they had scored the first victory in the fight. The Irish Medical Association has taken up the matter, and the chances seem to be that a limit has at last been reached where medical men will no longer, as heretofore, submit to constant under-payment on the strength of the worn-out appeal to their humanity.

The Dental Hospital of Ireland during the Past Year.

The thirty-seventh annual general meeting of the members and subscribers of the Incorporated Dental Hospital of Ireland was held last week. The annual report stated that the total number of attendances was 17,238. In the conservation department there were 4871 operations, and of these 3536 were free. In the dispensary there were 4585 attendances, all free. 1575 of the 2388 extractions in this department had the benefit of local anæsthetics. 1802 general anæsthetics were administered, 721 of which were free. The prosthetic department supplied 18 dentures and did 20 repairs free for necessitous patients who were unable to make any contribution. The work record for the year was more satisfactory than the balance-sheet. On Sept. 30th, 1916, the balance due to the Ulster Bank stood at £1299 18*s.* 6*d.*, and the hospital enters the present year with that adverse balance increased by £425 2*s.* Subscriptions and donations, which were £384 10*s.* 2*d.* last year, amounted this year to £366 1*s.* 6*d*, and patients' contributions, which amounted last year to £822 18*s.*, were for this year £798 19*s.* 5*d.* The board has appealed for more generous support on the grounds that the greater part of the work done, amounting to 15,785 cases, was free work.

Dispensary Doctors of Military Age.

In the King's Bench Division, before the Lord Chief Justice, Mr. Justice Gibson, and Mr. Justice Kenny, the case of the King *v.* the Local Government Board came on for argument. The question for decision by the court was whether the Local Government Board were justified in refusing their sanction to the appointment by the guardians of the Lismore union of Mr. Thomas M. Cronin as medical officer of the Tallow, co. Waterford, dispensary district, because he was of military age and eligible for service in the Royal Army Medical Corps. The case had been argued some months ago, judgment was reserved, and it was now re-argued. Mr. M. J. Kenny, medical officer to the Tallow Dispensary, died early in the year. Three candidates, all of military age, answered the advertisements for his successor. Mr. Cronin was declared elected for the duration of the war. The Local Government Board refused to sanction the appointment on the grounds that Mr. Cronin was 26 years of age and eligible for the Royal Army Medical Corps and that the guardians were in a position to make other suitable arrangements to provide for the sick poor of the Tallow district. The guardians stated that they could make no suitable arrangements for the Tallow Dispensary, and guaranteed that if Mr. Cronin at any time offered his services to the Royal Army Medical Corps they would not hold him to his appointment. It was also contended on behalf of the guardians that the Local Government Board had no right to go outside the Poor-law to enforce conscription on medical men of military age. After further argument judgment was finally reserved.

Nov. 20th.

PARIS.

(FROM OUR OWN CORRESPONDENT.)

Industrial Accidents Following War Wounds.

THE existing laws relating to industrial accidents have recently been modified in view of the fact that many of the workers are men who have been wounded and discharged from the Army. The new measure enacts that any ex-service man suffering from severe or incurable infirmity as a result of wounds or disease acquired on active service, who meets with an industrial accident after return to civil life, shall be

specially examined to ascertain if his accident is due in whole or part to his existing infirmity. In the former case his employer is exonerated from any liability for the pension granted to the victim or his heirs, and in the latter case from a proportion of his normal contribution. The pensions will be paid from the interest on a special disablement fund deposited with the national old age pensions fund under guarantee by the Ministry of Labour and financially administered by the Caisse des Depôts et Consignations. The modification should render it less difficult for discharged sailors and soldiers to find work in the factories than when the employer feared responsibility for accidents which he had good reason to assume would be more frequent in these ex-service men.

A New Artificial Leg.

Professor Amar, who is in charge of a laboratory at the School of Arts and Crafts devoted exclusively to the physiological study of working conditions, is well known for his work in analysing the movements of injured limbs by graphic methods. He recently presented to the Academy of Sciences a new form of artificial leg combining the pilon with the standard variety. The new leg weighs less than 2 kgs., is provided with joints at the knee and ankle, and is attached to the stump in a way which avoids the rubbing which often results from wearing a pilon. It is made of durable material capable of resisting the effects of perspiration and of inclement weather. By its use a normal gait is possible on the level, and even on an incline fatigue is reduced to a minimum. The addition of a gaiter makes the limb indistinguishable from one of flesh and bone. M. Amar supported his thesis by a demonstration of men walking freely with the new apparatus.

Condensed Milk in Acute Enteritis among Soldiers.

Dr. Lassablière has recently published a study of the results obtained from the use of condensed milk in the treatment of acute enteritis, a common condition among soldiers and apparently due to alimentary toxins combined with the direct affect of cold on the abdomen. The duration of symptoms is much reduced by feeding the patient exclusively on condensed milk diluted with four times its volume of rice water to the extent of 1-2 litres a day. The number of motions diminishes rapidly to the normal, while the discharge of mucus and blood ceases. With the usual diet of vegetable soup and milk, plus medicaments, the author finds the average duration of the disease to be 26 days, but with condensed milk, sweetened and not skimmed, the period is reduced to less than 15 days.

Cutaneous Origin of Streptococci in War Wounds.

It is becoming more and more certain that the streptococcus is the most dangerous agent of infection in gunshot wounds, whether acting alone or conveying an added virulence to the micro-organisms associated with it. Dr. Tissier has been able to show that any wound from which streptococci have been proved to be absent may, after simple irrigation, be safely reunited by first intention, whereas if streptococci are present drainage is indicated. MM. Levaditi and Delrez have gone a step further, and shown in a note read before the Academy of Sciences that the streptococcus, in common with other organisms infecting war wounds, has its origin in the skin of the wounded man, where it is present in health. These authors find a certain cutaneous flora common to groups of individuals, the transmission from one to another being favoured by the communal life in hutments. A group may be met with harbouring cultures of *B. perfringens*, another with Friedländer's bacillus, another with streptococci, and so on. They explain thus the fact that in the military units of a certain sector the wounds are richer in one particular organism than those of other units. The theory of carriers which has explained many peculiarities in the etiology of epidemic diseases may hold good also to explain the varieties of infection in war wounds. A typical example is furnished by the ambulance of La Panne, where the number of wounds infected with streptococcus rose from 19 per cent., which represented the proportion among the Belgian wounded in that sector, to 56 per cent., after the admission of British wounded. Streptococci were found in abundance on the skin of the latter. The authors believe, in fact, that the streptococcus is particularly prevalent among the British, accounting in this way for the assumed greater severity of scarlet fever in England.

Acute Poisoning by Arseniuretted Hydrogen on a Submarine.

Dr. Giardano has reported, in the crew of a submarine during submersion, acute symptoms of intoxication the cause of which could not be attributed to raised temperature or pressure, or to the lack of hygiene. After several hours' submersion the crew presented the following symptoms: nausea, vomiting, indefinable discomfort in the throat, metallic taste, intestinal colic with or without diarrhœa, headache, vertigo, and muscular weakness. Next day the symptoms were less marked, but there remained an icteric tint and tenderness on pressure over the liver, while the urine contained bile pigment and urobilin, the blood showing the anæmia of hæmolytic jaundice. Increased destruction of red cells was evidently present, due to a toxic cause. On close inquiry it was discovered that the cause of the occurrence was arseniuretted hydrogen arising from the accumulators during the submarine voyage. Arsenic was shown to be present in the asbestos separating the lead plates, and an analysis of the air in the submarine revealed traces of the highly toxic AsH_3. These facts should be borne in mind in the manufacture of accumulators intended for submarines.

Nov. 15th.

MEDICINE AND THE LAW.

Bowden v. *Bowden.*

IN the petition for divorce of Captain E. C. Bowden, R.A.M.C., recently heard by Mr. Justice Horridge, the issue depended upon a question of perennial medical interest—namely, the duration of pregnancy. The material facts, stated briefly, were as follows: On the night of Dec. 19th, 1915, sexual intercourse took place between the petitioner and respondent, but, according to the petitioner, under conditions which precluded the possibility of conception. On Dec. 20th the petitioner left for France, only returning some months later. The respondent, who had menstruated immediately before the intercourse, menstruated again in January, 1916, according to her own statement, while paying a visit to friends, and on Jan. 19th went to her father's house. The suggestion on the part of the petitioner was that at some time immediately before going to her father's house she committed adultery. On March 10th, 1916, she was operated upon for appendicitis and was then found to be pregnant, and when she informed her husband he asserted positively that she must be mistaken. On his return to England in June he was told that the child was expected in September. On Sept. 28th the respondent had a fall, for which she was treated in a nursing home at Worthing, where she remained until she was delivered normally on Oct. 22nd, 307 days after the date when her husband left England. For the petitioner, Dr. H. R. Spencer and Dr. W. S. A. Griffith gave evidence as to the normal period of gestation, as to cases under their observation in which this period was exceeded, or was stated to have been exceeded, according to the patient's calculations, and as to the probability of normal delivery of a child born at 10 months. Dr. F. Hinds gave evidence for the respondent with regard to the operation for appendicitis, and Mr. E. Davis testified as to his attendance upon her after her fall on Sept. 28th; he was of the opinion that labour had then begun but had been arrested. Dr. John Phillips, speaking as to prolonged gestation, cited instances of 298 days, 306 days, and 308 days respectively which had occurred in his experience. Mr. Justice Horridge declined to say that on the medical evidence given there was no case to answer, and the respondent went into the witness-box and denied absolutely that she had committed adultery. His Lordship, in giving judgment, dismissed the petition, stating that there were points in the respondent's conduct which were extraordinary after she learnt that she was pregnant, but that he accepted her testimony with regard to the marital relations of herself and her husband, and believed her story. He pointed out that the medical evidence admitted the possibility of a child being born at 307 days. The issue in this case was only of fact. The legal presumption is that a child born in wedlock is legitimate unless impossibility through non-access of the husband to the wife is proved, there being no evidence, other than the date at which the child was born, pointing to adultery on the part

of the wife. Mr. Justice Horridge's observation, which he is reported to have made before counsel addressed him on behalf of the petitioner, was quite beside any points raised in the case. According to the *Times*, he said that he "believed the respondent, and that, as he believed her, he cared more for her evidence than for that of all the doctors in the world." That is not the language which a judge should use concerning expert evidence given before him, while the respondent may rightly feel aggrieved that she should seem to have won her case through the disregard by the judge of medical evidence.

A Discharged Soldier as a Tramcar Driver.

After holding an inquiry into a tramway accident at Dover, Colonel Pringle, inspector under the Board of Trade, has stated in his report that the accident was due to the driver having failed to make proper use of the means at his disposal for stopping the car, and to his having "completely lost his head at the critical moment." He adds that the man in question had been discharged from the Army for nervous breakdown after 18 months' service in Egypt, and calls attention to the necessity for nerve and experience in drivers of tramway cars. He further points out that men discharged as unfit for military service through nervous breakdown are unlikely to prove suitable two months later as drivers on difficult routes, and that it would be wiser to close such routes than to place upon them drivers lacking the necessary experience. All medical men will agree with Colonel Pringle's view.

The Liability of a Farmer Selling Milk.

In a recent case decided by the Divisional Court, the court allowed the appeal of an inspector under the Food and Drugs Act for the borough of Hastings who had failed to secure a conviction before the magistrates at petty sessions. The appellant had taken samples from a churn containing milk sent by rail to Hastings by the defendant, a farmer, and had found it deficient under the Sale of Milk Regulations, 1901. It was found as a fact that the milk was put into the churn as it came from the cow, but the churn was not locked and there was no evidence to prove that it had been tampered with in transit. It was contended by the appellant that the presumption under the regulations that the milk was not genuine had not been rebutted by the respondent, as there was nothing to show what happened to the milk-churn on the journey, and that the respondent's liability did not cease until the arrival of the milk at the place of delivery. The justices considered that as the milk was genuine as it came from the cow when delivered to the railway company, the respondent was free from liability, and they declined to convict. In arguing on behalf of the appellant counsel called attention to the terms of the contract between the farmer and the milk-dealer whereby the property in the milk was not to pass until the churn reached Hastings Station. Mr. Justice Darling, in delivering judgment allowing the appeal, said that the case was absolutely concluded by the judgment in a case already decided—Parker *v.* Adler, 15 Law Times Reports 3; 1889, 1 Q.B. 20. The respondent was clearly liable to conviction, and if the authorities had been consulted the case would not have been stated.

DONATIONS AND BEQUESTS.—By the will of the late Mr. J. Isaac Jacobs the testator has bequeathed £5000 for hospitals and Jewish institutions, including the Swansea Hospital, and such hospitals as the executors may select at Cork and Passage West, and the Home and Hospital for Jewish Incurables, and to pay not less than 100 guineas to the Swansea Hospital.

CHRISTIAN FELLOWSHIP CLUB AS A MEMORIAL TO FALLEN STUDENTS.—On Nov. 26th the Student Movement House, 32, Russell-square, W.C., will be opened as a memorial to students who have fallen in the war, when the Archbishop of Canterbury, the Rev. Ivor J. Roberton, of Regent-square Presbyterian Church, and Miss W. A. Richardson, vice-principal of Westfield College, will take part in the ceremony. The house has been fitted up as a club where students of London, the largest college centre in the world, may meet for social and recreative amenities and where Christian fellowship may be generally promoted. It is pointed out by the secretary, Mr. Tissington Tatlow, that no religious test of any kind will be applied to members of the club nor will work of a proselytising character be permitted.

Correspondence.

"Audi alteram partem."

SUCCESS AND FAILURE IN THE TREATMENT OF TUBERCULOSIS.

To the Editor of THE LANCET.

SIR,—Dr. W. M. Crofton, of Dublin, has recently raised in your pages [1] a plea for prophylactic injection in the war against tuberculosis, basing his argument on the success recently attained in the Army by such means against the enteric fevers. This argument ignores the well-known principle that each disease must be dealt with according to its special nature and peculiar mode of propagation. A few instances may be quoted to illustrate this principle. Malaria is dealt with successfully by draining the breeding places of the mosquito, bubonic plague by destroying the rat, but neither of these methods would succeed against pneumonic plague, which must be prevented from spreading by isolating the patients and protecting by masks those who have to come into close contact with them. Hydrophobia has been suppressed by muzzling the dogs; and, lastly, typhoid itself, in the civil population, has been reduced to the status of an uncommon disease by sanitary engineering. Indeed, the success of sanitary engineering in this field was so great that it led at one time to the belief that it was the one and sovereign method for protecting the health of the people, and for a time there was little progress. But when the principle to which I have referred became recognised one success followed after another. Protective inoculation for tuberculosis therefore must claim no borrowed support but must stand on its own merits—if it has any. Let us, for a moment, consider what these are.

The inoculation of small laboratory animals with tuberculin and a host of other products of the tubercle bacillus has been going on for the last 30 years without much success, but, on the other hand, some quite demonstrable increase of resistance has been obtained in calves by the injection of living tubercle bacilli, human or bovine. Inoculated animals may even be able to resist the injection of large doses of bovine bacilli (50 mg.) which prove, almost without exception, fatal to control calves in a few weeks.[2] But the acquisition of this degree of resistance is uncertain, and, according to all authorities, not of long duration, lasting at most only a year, or perhaps two. Moreover, it has been shown that the bacilli may remain alive for considerable periods, may produce lesions in eyes or joints after a year or more,[3] and may even remain, in the case of heifer calves, latent in the mammary gland, and infect the milk when the calf has become a cow.[4] The injection of dead bacilli has not been followed by any marked increase of resistance. For these reasons protective inoculation of cattle has been discontinued.

This being so, it is pertinent to ask whether we are likely to produce by such means better results in man. Man is probably about as good a subject to immunise against tuberculosis as the ox. Both species are endowed by nature with a good deal of resisting power. Man, we now know, frequently becomes infected without developing progressive disease. The ox develops chronic tuberculosis which often makes so little difference to the animal's appearance that it seems to be perfectly healthy [5]; moreover, we know that we can inject it with small doses of living bovine bacilli without any serious result.[6] Man, therefore, is probably a good subject to immunise, but tuberculosis, it seems, is not a disease which confers much immunity. Moreover, man is at a great disadvantage as compared with the ox, inasmuch as there is no type of tubercle bacillus incapable of causing death or progressive disease in him as the human type of tubercle bacillus is incapable of causing such results in the calf. For this reason it could never be permissible to use in the case of man living cultures, as has been done, with the amount of success indicated, in the case of the ox. The injection of dead bacilli into experimental animals, as I have already said, has not been encouraging, and that any results worth having could be obtained from the use of minute doses of dissolved bacilli, such as Dr. Crofton recommends, seems to the writer highly improbable; at all events, the method ought first to be proved effective on animals before it is applied on any considerable scale to human beings.

Thus there would appear little reason to think that the application of protective inoculation to the prevention of tuberculosis would be of any use, even if it could be made without provoking the grave hostility of the people. That it has been found possible to apply antityphoid inoculation in the Army is because the soldier knows well from the experience of many of his fellows in India and South Africa the very grave risk from typhoid that he will have to face on active service, and—not least—because the Army consists of young men under military discipline. Even so, it was not carried through without much outcry; but it would be a very different sort of tune if any pressure were to be put upon the people to have their children inoculated against tuberculosis. It is only fair to Dr. Crofton to add that he never proposed any measure of compulsion, but I would ask him if he thinks any considerable amount of protective inoculation could be obtained without some form of compulsion?

The means for dealing prophylactically with tuberculosis appear to me to be threefold, and capable of classification under the three following heads:—(1) The amelioration of the conditions of life of the poor; (2) the cure of early cases; (3) the isolation of those who are acting as sources of infection.

The first of these means has been in action progressively for many years and is still going strong. The second has been worked by the great sanatorium movement initiated some ten years ago, and by the more recent tuberculosis dispensaries. If, regarded as a means of stamping-out tuberculosis, it has failed, it is because of the difficulty of getting hold of cases in the really early stages of infection, and one of the most promising of the many activities of our new tuberculosis officers would seem to be the hunting out of these early cases from among the contacts with persons who have recognised disease. The third method seems at last to be making headway, gradually, and in the face of considerable opposition. But the tide is flowing in its favour. It is the one method of the three which has not as yet been deliberately employed to any great extent, and it seems to me to contain the most promising germs of hope for the future.

I am, Sir, yours faithfully,

Cambridge, Nov. 11th, 1917. LOUIS COBBETT.

PROPHYLAXIS IN VENEREAL DISEASE.

To the Editor of THE LANCET.

SIR,—The account given by Dr. G. Archdall Reid in his letter published in THE LANCET of Nov. 3rd is a contribution of much importance to the practical side of the prophylactic treatment of venereal infections. It indicates that the disinfectant power of a 1/2000 solution of permanganate of potash *used without delay* after exposure to infection is sufficient to kill the microbes of both syphilis and gonorrhœa before they penetrate the tissues. Dr. Reid infers from this that more elaborate and cumbersome methods are unnecessary *if disinfection be carried out immediately:* and says that injections into the urethra and calomel cream are in that case quite unnecessary.

The success, however, of the method of disinfection which he advocates depends on its *immediate* employment, and also on the healthy and unabraded condition of the genital organs; and it has been shown by Metchnikoff's experiments, at least in the case of syphilis, that even calomel ointment of 30 per cent. strength is not to be depended on for complete safety if used *later* than 12 hours after exposure, though it is to be thus trusted when used within 12 hours. Dr. Reid also implies that inunction and injection are necessarily more cumbersome and involve more delay than the use of the solution advised by him. He probably employs the words "immediately" and "without delay" in their literal sense: and thus a question might be raised as to the comparative practical value of disinfectant appliances, one of which *must* be used *immediately*, while the other *may* be used within 12 hours after exposure to infection. It is to be remembered also that the proper use of calomel ointment is effectual whether or no there is any abrasion of the skin or mucous membrane.

I am, Sir, yours faithfully,

London, Nov. 17th, 1917. H. BRYAN DONKIN.

INSANE SAILORS AND SOLDIERS.

To the Editor of THE LANCET.

SIR,—The letters of Dr. James F. Gemmel in THE LANCET for Oct. 20th, of Dr. R. H. Steen in THE LANCET for Oct. 27th, and of Dr. W. J. A. Erskine in THE LANCET for Nov. 17th, show the continually recurring tendency there is to criticise the arrangements made by the War Office in conjunction with the Board of Control for the care of those members of the fighting forces who have unfortunately suffered from a mental breakdown, but the real ground for these criticisms is far beyond, and is much wider than, the simple question of what fresh buildings can be erected or should be taken over—which really offer no solution to those in high authority, although they may be compelled to follow this course.

I am sorry to see in Dr. Gemmel's letter that he is apparently so unsympathetic—or, may I say, so un-democratic—as to classify his asylum patients dichotomously into paupers and criminals, and thus to reflect upon them purely accidental conditions for which they themselves are often not responsible and which in the main are so undeserved. In the view he adopts he overlooks the modern aspect of crime as the product of social circumstances rather than of atavistic or pathological defects; and have not our finest young fellows in the trenches and dug-outs shouldered the same burden and shared their risks side by side with Dr. Gemmel's despised classes, and are these classes, therefore, not entitled, for the sacrifices they have made and by moral right, to the deepest national gratitude? Indeed, one of the most comfortable and most efficient of our metropolitan hospitals is one in which these two types dwell harmoniously, and there are here no personal reflections such as are indulged in elsewhere, for one block is devoted to the soldier, whilst the others are at the service of those patients who are precisely of the class whom misfortune of another kind has compelled to seek a shelter in the asylum.

If our asylums are good enough for the soldier's father and mother, sisters, and other relatives, it is surely unjust, if not cruel, to deprive our sick sailors and soldiers of equal privileges; if they are not, then it is hypocrisy to pretend to persuade ourselves that we are doing our best for their relatives, and those engaged in the work should withdraw if they have any sense of shame. As to the stigma of pauperism, it is a well-known fact of experience that our public asylums are being more and more appreciated by the middle and lower-middle classes as the best homes of recovery for cases of mental illness. In fact, at Claybury, I had repeated applications to receive as patients those whose friends desired them to be under treatment at much higher rates than could be officially charged, and who in consequence had to be refused.

No one thought that the war would last so long as it has done, but everybody felt from the very commencement of hostilities that those who voluntarily offered their lives to defend human brotherhood, social justice, and our liberty should receive every personal and generous recognition as well as every medical and nursing care that the best skill could offer to them; and if the Bill which the Medico-Legal Society had drafted, and which was carried through its first reading in the House of Lords just before the war, could have been proceeded with, we should have heard nothing of the unsatisfactory treatment of our sailors and soldiers who had suffered a mental breakdown, nor of the cheap cant about the stigma imparted by asylums, asylum doctors, and asylum nurses—all of which is gradually dying out now that the value of asylums, which are hospitals of restoration as well as homes of care, and of asylum treatment is becoming more recognised and their methods more often adopted for all functional mental conditions.

I intend to propose at the next meeting of the Parliamentary Committee of the Medico-Psychological Association of Great Britain and Ireland, which is to meet on Nov. 27th, that there should be legal power (duly safeguarded) to treat all cases of mental breakdown for a period of six months without certification, an arrangement which Dr. George M. Robertson informs me is working admirably in Scotland, and I shall be glad to receive any comments from your readers.

I am, Sir, yours faithfully,

ROBERT ARMSTRONG-JONES, M.D.

105, Harley-street, Nov. 20th, 1917.

TREATMENT OF WAR NEUROSES.

To the Editor of THE LANCET.

SIR,—Your Parliamentary correspondent reports the reply of Mr. Macpherson to Colonel Clive with respect to the treatment of shell-shock patients in London. All familiar with the circumstances will be glad to read Mr. Macpherson's admission that it may be possible to discontinue the neurological centre in London as a treatment centre.

A large conference of neurologists recently met at the War Office. I have reason to know this, as they unanimously rejected a scheme in which I am interested, in spite of the fact that the Director-General and the neurological adviser of the A.M.S. had both agreed to give it a trial, and the President of the Special Medical Board had expressed himself as optimistic concerning its success.

My scheme, now known as the "Country Host Institution," was originally intended for the benefit of pensioners and the Ministry of Pensions and London War Pensions Committee have sanctioned it experimentally to the extent of 30 cases. Half that number of pensioners have already been sent off and the early reports are very satisfactory.

As the public response to my request for "hosts" was instantaneous and widespread, I had some hundreds to spare and offered these to the War Office, so that some of the undischarged men suffering from war neuroses might also benefit. It is this offer which the conference refused. The principles of the scheme were as follows:—

The patient will be surrounded with a healthy instead of a neurotic subconscious influence. He will be removed from the harmful sympathy of friends and from the noise and rush of town life, to the kind but firm care of his "host" and the fresh air and peace of the country, where he can be encouraged to perform a small but increasing amount of simple work.

In order to carry out this treatment it is suggested that:—

1. Certain mild cases of "shell shock" and war neurasthenia shall be selected for treatment singly at country places where suitable accommodation has been offered by landowners, farmers, gardeners, &c.
2. The patient shall be billeted on the "host" upon the usual terms (3*s*. per diem), and shall perform appropriate work, according to directions communicated to the "host" by the medical officer in charge.
3. Pay, separation allowances, &c., shall be the same as if the soldier were in hospital.
4. Even when cured the patient shall not be called upon to perform military service abroad, but it is confidently hoped that he may be made fit for home service.
5. Patients shall be visited at stated intervals, by the medical officer under whose care they are, and in case of illness may be transferred to the nearest military hospital.
6. Complaints may be sent either by the patient or by the "host," to the medical officer in charge of the scheme.
7. The cases shall be selected by the medical officers of the Neurological Section of the 4th London General Hospital, acting in consultation with the medical officer of the scheme.

I am informed that the conference which threw out my scheme has decided in favour of opening a series of hospitals containing a large number of beds, and seme of these will probably be in urban centres for convenience of management and transport. I sincerely hope that the conference may yet consider my scheme, for I have every reason to believe that the patriotic hosts on whom its success must depend could be found in very large numbers.

Medical experience and common sense agree that (1) country life and conditions tend more towards the cure of neuroses than the noise and rush of towns, and that (2) nervousness is extremely communicable. If these premisses are admitted a very little thought should be sufficient to convince every unbiassed person, whether neurologist or layman, that it is wrong to congregate nerve-shattered men in hospitals, unless the severity of their symptoms renders it unavoidable, and that it is unpardonable to keep even those serious cases in a town, especially in London where air raids are frequent.

It seems obvious that, however convenient for the authorities, it is exceedingly harmful to the men that they should be congregated, the mild along with the severe, and perhaps within an air-raid area. The following extract from a letter sent me by Archdeacon Dray will give an experienced eye-witness's impression of the effect of air-raids on nerve-shattered men:—

"Last night we had a repetition of former experiences in these —— schools, where 200 men in varying stages of helplessness act and react upon each other day by day, and during the raids are nearly frantic with terror, numbers of them writhing under their beds or falling back into their former palsied condition, their eyes transfixed and their twitching faces wearing a look of abject horror. It is pitiful to hear their repeated appeals: 'Why can't I go into the country, somewhere where it is quiet and restful? Is a man who has gone through what we had at the front to be kept in this hell until he loses his reason,' &c. The nurses are simply splendid in their calm bravery but I seriously wonder how long some of them can stand the spectacles presented," &c.

The ideal treatment, for all the milder cases at any rate, is to send them singly to the country, where they may recuperate in peace and quietness, performing suitable tasks in the open air and with healthy mental influences round them. The Country Host Institution could send over 200 men to excellent country houses within a week or two. Yet the authorities, who consider it wise to allow the men out into the London streets, refuse to send them to gardens and farms where they would be under supervision.

It will very greatly further the views expressed above if any medical men who are in sympathy with them will communicate with me.

I am, Sir, yours faithfully,

13, South Eaton Place, Belgrave-square, S.W. 1, Nov. 19th, 1917. THOMAS LUMSDEN.

SIR RICHARD CROFT AND THE CASE OF THE PRINCESS CHARLOTTE.

To the Editor of THE LANCET.

SIR,—The annotation entitled "The Vindication of a Medical Reputation" in your issue of Oct. 27th hardly does justice to Sir Richard Croft. As the son-in-law and successor of Denman, who was the leader in obstetric medicine in London, and one of the best and most cultured of men, it may be safely concluded that Croft would have the fullest midwifery training then available. British obstetric science was already a great tradition, coming down from Douglas, Smellie, and William Hunter (who, by the way, attended with a midwife the queen of George III.), and training in that department by lectures and clinical work was given by Denman and others, although it had not yet taken its place alongside of other departments of medicine in university and collegiate courses. Wadd in 1824 states that Sir R. Croft had the degree of M.D., "possessed much practical knowledge," and "for thirty years continued to practise with the highest credit and success." Brodie, writing long afterwards, in 1865, speaks of Croft's "great reputation," and that he was "a man of acute feelings, a thorough gentleman, having a high sense of honour, and of a kind and liberal disposition."

As regards the case of the Princess Charlotte in 1817, the letters quoted in Playfair's "Midwifery" may be supplemented by Dr. Matthew Baillie's own account of the occurrence. It is taken from a manuscript letter which has been preserved, addressed to the Princess's mother, and those who know Baillie's absolute candour of mind and character will attach the more value to his words. He writes:—

"This sad event has not arisen from any error in the treatment of her case. The Princess had enjoyed more than her usual health previous to her labour. The labour was exceedingly tedious, for it lasted 50 hours, but it was attended with no unusual circumstances, except a slight contraction of the womb, retarding the passing away of the after-birth. The Princess was well for more than three hours after the labour. She was suddenly seized with uneasiness in her chest, great difficulty of breathing, extreme restlessness, and a very rapid, feeble, and irregular pulse. Sir Richard Croft, Dr. Sims, and myself endeavoured to support her sinking frame with every kind of cordial, —— but the Princess died in two hours from the beginning of the attack. Sir Richard Croft was indefatigable in his attention and zeal through out the whole of this very sad business. He never quitted for more than a few minutes at a time the bedchamber of the Princess from the beginning of her labour until she expired. The child was a male, well formed, and stillborn. ..... About a pint of coagulated blood was found by examination in the womb and two ounces of water were found in the bag surrounding the heart. These may in some measure account for the fatal event."

The details given in this report confirm Playfair's inference that the cause of death was pulmonary embolism, then unknown. Embolism, it may be remembered, was only discovered by Kirkes and Virchow a generation later.

I am, Sir, yours faithfully,

Devonshire-place, W., Nov. 14th, 1917. R. HINGSTON FOX.

Mr. Colston Wintle, L.R.C.P., M.R.C.S., has been elected for the fourteenth year chairman of the health committee of the Bristol town council.

Dr. Barclay Baron, lately Lord Mayor of Bristol, has received the insignia of the Russian Red Cross Order for his successful work as president of the Bristol Russian Red Cross Fund.

The War.

THE CASUALTY LIST.

THE following names of medical officers appear among the casualties announced since our last issue :—

Killed.

Capt. J. F. Russell, M.C., R.A.M.C., attached Royal Welsh Fusiliers, received his medical education at the Middlesex Hospital, London, and qualified in 1916, whereupon he joined up. The award of the M.C. was recorded in THE LANCET of August 25th, 1917, p. 332.

Capt. E. Phillips, R.A.M.C.

Died.

Lieut. H. F. Ransome, R.A.M.C., was educated at the Owens College, Manchester, and at St. George's Hospital, London, and qualified in 1892. He was in practice at Bowdon, Altrincham, where he was surgeon to the local hospital, and since joining the R.A.M.C. was in charge of Queen Mary's Military Hospital at Whalley, where he died.

Lieut. G. Taylor, R.A.M.C.

Wounded.

Capt. H. G. Rice, R.A.M.C., attached Durham Light Infantry.
Capt. H. W. Gush, R.A.M.C.
Major W. Bapty, Canadian A.M.C.
Capt. H. F. Dunstan, Australian A.M.C.
Major A. V. Meehan, Australian A.M.C.
Capt. G. D. Eccles, R.A.M.C.
Capt. W. Harmens, R.A.M.C., attached Cheshire Regt.
Capt. D. G. Kennard, R.A.M.C., attached Yeomanry.
Capt. G. Sutherland, R.A.M.C., attached Scottish Rifles.
Lieut. J. Avery, R.A.M.C., attached Essex Regt.
Capt. J. Young, R.A.M.C., attached Durham Light Infantry.
Capt. O. J. Ellis, Australian A.M.C.
Capt. R. M. Thomson, Australian A.M.C.
Capt. C. G. Brentnall, R.A.M.C., attd. Lancashire Fusiliers.

CASUALTIES AMONG THE SONS OF MEDICAL MEN.

The following additional casualties among the sons of edical men are reported :—

Lieut. T. H. W. Waller, Gloucestershire Regiment, killed in action, only son of Dr. A. W. Waller, of Stroud, Gloucestershire.

Capt. D. D. A. Anderson-Berry, Royal Scots Regiment, killed in action, only son of Dr. D. Anderson-Berry, of Highgate, London, N.

Capt. J. F. Russell, M.C., R.A.M.C., attached Royal Welsh Fusiliers, killed in action, eldest son of Dr. W. F. Russell, of Holyhead.

Lieut. V. W. Bennett, Royal Engineers, killed in action, eldest son of Lieut.-Col. V. B. Bennett, I.M.S.

Private C. E. L. Cox, Canadian Infantry, killed in action, eldest son of Dr. A. E. Cox, of Grange-over-Sands, and late of Southport.

Lieut. G. L. Brown, Loyal North Lancashire Regiment, killed in action, youngest son of Dr. A. Brown, of Hatch End, Middlesex.

Second Lieut. S. G. Cunningham, Royal Field Artillery, killed in action, youngest son of Dr. J. Cunningham, of Campbeltown, Argyllshire.

THE HONOURS LIST.

The following awards to medical officers are announced. e acts of gallantry for which the awards were made are yet announced. All are members of the R.A.M.C. unless erwise stated. The dates in parentheses, in those cases ere bars have been awarded, refer to the number of E LANCET in which a record of the original decoration l be found:—

Distinguished Service Order.

Temp. Capt. G. W. Armstrong; Major S. V. Appleyard, Australian M.C.; Major W. W. S. Johnston, M.C., Australian A.M.C.

Bar to the Military Cross.

Capt. W. McM. Chesney, M.C. (June 26th, 1915, p. 1373); Temp. Lt. R. W. Hogg, M.C. (Dec. 16th, 1916, p. 1034); Temp. Capt. H. F. Wilson, M.C. (Oct. 6th, 1917, p. 550); Temp. Capt. M. B. Lawrie, M.C., South African M.C. (August 4th, 1917, p. 176).

Military Cross.

Capt. B. G. Beveridge; Capt. V. C. Brown, Australian A.M.C.; Temp. Capt. D. S. Cassidy, Lt., Canadian A.M.C.; Capt. G. Eustace; Lt. F. G. Harper; Temp. Capt. J. Jack; Capt. C. H. Kellaway, Australian A.M.C.; Capt. H. H. Leeson; Temp. Capt. P. M. MacLachlan, Lt. J. S. McConnachie; Capt. P. J. F. O'Shea, Australian A.M.C.; Temp. Capt. A. W. Young.]

FOREIGN DECORATIONS.

Italian.

Silver Medal for Military Valour.—Deputy Surg.-Gen. O. W. Andrews, R.N.; Fleet-Surg. G. E. Duncan, R.N.

OBITUARY OF THE WAR.

JOSEPH PATRICK PEGUM, L., L.M. R.C.P.S. IREL.,
CAPTAIN, ROYAL ARMY MEDICAL CORPS.

Captain J. P. Pegum, who was killed in action on Sept. 26th at the age of 25 years, was youngest son of the late James Pegum, of Glin, co. Limerick. He was educated at Mungret and Clongowes Wood Colleges, studying medicine at the Royal College of Surgeons in Ireland, where he belonged to the Officers' Training Corps. He qualified in April, 1916, and was immediately given a commission in the R.A.M.C., becoming attached to the King's Shropshire Light Infantry. After working for long under conditions of great danger and difficulty he was killed by the explosion of a shell. Captain Pegum was a keen sportsman, excelling at cricket, lawn-tennis, fishing, and shooting. His superior officer writes of him as a splendid battalion medical officer and one whose loss was keenly felt.

JAMES HARCOURT CECIL GATCHELL, L.A.H. DUB.,
MILITARY CROSS,
CAPTAIN, ROYAL ARMY MEDICAL CORPS.

Captain J. H. C. Gatchell, who was killed in action on Sept. 27th, was youngest son of Rev. J. H. Gatchell, D.D., rector of Earlsgift, co. Tyrone. After qualifying in 1912 he made several voyages as ship's surgeon to the Elder Dempster Line, being present at the taking of Derala by the British. Joining the R.A.M.C. in 1915, he was attached to the Lancaster and later to the Sussex Regiment, earning his Military Cross in August last. The award runs : "He worked for many hours in the open under shell-fire, frequently dressing men on the spot where they were hit. He worked unceasingly for 16 hours without food. His aid-post was blown in and he was wounded, but he refused to go down to the dressing-station till ordered to do so by his commanding officer." He was killed by a shell two months later while he was again dressing cases in the open. Fellow-officers write of Captain Gatchell's unfailing cheerfulness amid all the circumstances of trench life.

THE Albert Medal has been awarded to Surgeon Probationer Robert Sydney Steele Smith, R.N.V.R., for services rendered by him as medical officer on a torpedoed ship.

TRURO NAVAL HOSPITAL.—The Admiralty Medical Department has requested the authorities of the Truro Naval Auxiliary Hospital to provide additional accommodation for 50 patients, and it has been decided to do so.

Obituary.

GEORGE BROWN, M.R.C.S. ENG., L.S.A.,

LATE DIRECT REPRESENTATIVE FOR ENGLAND AND WALES ON THE GENERAL MEDICAL COUNCIL.

WE regret to announce the death of Mr. George Brown, who died at his residence in Exeter on Nov. 15th, in the seventy-third year of his age.

George Brown was born at Callington, Cornwall, and received his professional education at the medical school of Charing Cross Hospital, where he was both a scholar and medalist. After holding the usual resident appointments at the hospital, and being for a time demonstrator of anatomy in the school, he entered general practice in the north of London, and during that period became a prominent representative of the advanced reform party in the medical profession. He was a forceful public speaker and vigorous writer, and was prepared to exercise his talents on behalf of the general practitioner anywhere and at any time. The inclusive nature of his advocacy prevented him from securing the power for good that might have been his had he directed his reforming energies more to particular abuses, and had he been less perfectly convinced that all the consultant section of the profession were leagued against the general body.

In 1897 he got his chance as a reformer, for he became a direct representative for England and Wales on the General Medical Council. He owed his success at the election largely to a promise made to the constituency in his election address that he would oppose the impending legislation which shortly afterwards materialised into the present Midwives Act, the election turning almost exclusively upon a question which, deeply as it affected the interests of the medical profession, had already passed out of the sphere of the General Medical Council. For ten years he was a member of the Council, but neither his style of speaking nor the matter of his speeches exercised much influence on the opinions of that body—his onslaughts were too vague, his criticisms too general, and his remedies too crude. But those most opposed to his methods or at variance with his theories recognised in him an enthusiast for the cause of right as he conceived it.

Some 15 years ago George Brown retired from practice in London, which had become arduous to him in a damaged condition of health, and returned to his native town of Callington, where he was at work when the war broke out. In 1915 he went to Exeter and became honorary physician to the Exeter Dispensary. In the spring of this year he was injured in a street accident and had remained in bad health until he died.

George Brown worked hard all his life, and if he realised some only of his ambitions it must be remembered that those ambitions were large and ill-defined. But what he was able to perform was all to the good. He wrote a good many pamphlets on medical subjects and two small books, "Aids to Anatomy" and "Aids to Surgery," which at their date were found useful to many students. He was editor of the *Medical Times*. He married late in life and leaves a widow and one young son, to whom we offer our real sympathy.

JAMES HYSLOP, M.B., C.M. EDIN., D.S.O.,

LIEUTENANT-COLONEL, S.A.M.C.

Lieutenant-Colonel J. Hyslop, of the South African Medical Corps, died at the Sanatorium, Pietermaritzburg, on Oct. 5th, at the age of 61. He was born in Kirkcudbrightshire and educated at Hutton Hall and at Edinburgh University, where he graduated M.B., C.M. in 1879. After studying at Berlin, Vienna, and Munich, he took up appointments at the Border Counties Asylum at Melrose and at the Morningside Asylum, Edinburgh, and subsequently went to South Africa, where, in 1882, he was appointed medical superintendent of the Natal Government Asylum, Pietermaritzburg, now known as the Natal Mental Hospital. From this post he retired two years ago, after holding it for 33 years. Colonel Hyslop served with the Natal forces in the Boer War, and for his services was awarded the D.S.O. Some 18 months ago he took over the duties of Director of Medical Services at the Durban base, but his health breaking down he returned to Pietermaritzburg, where he died, the immediate cause of his death being pleurisy and pneumonia. Colonel Hyslop, who was president of the Natal Medical Council, was the Natal delegate to the Victoria Plague Conference in 1899 and chairman of the Durban Plague Conference held in the same year. He was the author of a work dealing with the anatomy of the central nervous system.

EDMUND FREDERICK TANNEY PRICE, M.B., C.M. EDIN.,

RADIOLOGIST TO CHALMERS' HOSPITAL, EDINBURGH.

THE death of Dr. Edmund Price occurred on Oct. 27th under somewhat tragic circumstances. He was, indeed, one of the many instances in these times of a man sacrificing his life at the call of duty, for in the middle of a full professional career, in which there was small opportunity for leisure, Dr. Price, at the age of 54, joined the 1st Battalion City of Edinburgh Volunteers when it was inaugurated, with them drilled regularly, sometimes standing guard all night, and it was while attending manœuvres with his battalion that he met his untimely death.

Edmund Price belonged to a medical family, for his father, Dr. A. G. Price, was a civil surgeon in the Indian Medical Service, four brothers were medical men and he is survived by—besides his widow and a married daughter—three sons, two of whom are qualified and serving in His Majesty's forces, while the third is a medical student. Born in India 55 years ago, he received his early education there and came to Edinburgh University later. Graduating in 1884, he at once went into general practice, and for 22 years was well known and highly esteemed as a successful physician in Edinburgh. During that period he obtained a wide knowledge of his profession and amassed a large amount of clinical material which was to stand him in good stead when he took up X ray work. This had been attracting his attention for the last few years that he was in general practice, and in 1906 he determined to specialise in the subject.

As a radiographer he immediately found a new sphere of usefulness, and his work was quickly recognised to be of a very high order. He was skilful and painstaking. He made a careful study both of the anatomical and clinical aspects of his specialty, and, moreover, took the opportunity, whenever possible, of being present at the operations on patients whom he had X rayed. By these means he acquired great experience in the interpretation of his plates, so that the profession came to value his opinion and to appreciate the assistance he was able to render them. His caution in not being led into reading more in his plates than was warranted gave him a well-earned reputation as a trustworthy expert witness. With regard to the therapeutical side of his specialty, Dr. Price quite recognised its limitations, and this attitude served still further to gain for him the confidence of the profession. In 1907 he was appointed radiologist to Chalmers' Hospital and that appointment he held till the time of his death. He was a member of the Obstetrical Society, the Edinburgh Medico-Chirurgical Society, and the Royal Society of Medicine. Among his contributions to the literature of radiology was a paper published in 1911, on "The Diagnosis of Urinary Calculi by means of the X Rays," and an important article published in the *Edinburgh Medical Journal* in 1914, entitled "The Röntgen Ray and Bismuth Meal Method as an Aid in the Diagnosis of some Alimentary Diseases." In addition he contributed the X ray illustrations of the "Manual of Surgical Anatomy" (Beesley and Johnston).

Dr. Price's life was too fully occupied by his professional work to allow of much time for other outlets for his energetic nature, but two things appealed to him strongly—namely, ambulance work and volunteering. He was, since 1888, a successful lecturer and examiner under the St. Andrew's Ambulance Association and did excellent work in this connexion: while his association with the Volunteers dates back to the time when, as a student, he joined the 4th Battalion Royal Scots.

A FOOD ECONOMY SERMON.—In accordance with a proposal by Sir Arthur K. Yapp, Director of Food Economy, the Bishop of London will preach a special food economy sermon on behalf of the League of National Safety at St. Paul's Cathedral, on Sunday next, Nov. 25th.

Medical News.

ROYAL COLLEGES OF PHYSICIANS OF LONDON AND SURGEONS OF ENGLAND.—At a Comitia of the Royal College of Physicians on Oct. 25th, and a Council meeting of the Royal College of Surgeons on Nov. 8th, diplomas of L.R.C.P. and M.R.C.S. were respectively conferred upon the following candidates (including seven ladies), who have passed the final Examination in Medicine, Surgery, and Midwifery of the Conjoint Board, and have complied with the necessary bye-laws:—

Sawy Ahmed, London Hospital; Edwin Baylis Ash, Birmingham University; Ruth Balfour, Royal Free Hospital; Noel Arthur Hamilton Barlow, Guy's Hospital; George Edmondson Birkett, Cambridge and Manchester Universities; John Anthony Birrell, University College, Cardiff, and St. George's Hospital; Anthony Blackstock, King's College Hospital; Numa Sylla Bonard, Geneva University; Geoffrey Bourne, St. Bartholomew's Hospital; John Walker Brash, St. Mary's Hospital; Arthur Bulleid, Guy's Hospital; Horace Braithwaite Bullen, Cambridge University and St. Bartholomew's Hospital; Finlay Cameron, Charing Cross Hospital; William Arnold Clements, Birmingham University; Bernard Stanley Collings, University College Hospital; Julien David Constantin, St. Bartholomew's Hospital; George Wilfred Coombes, London Hospital; John Rudolph Cox, Guy's Hospital; Eustace Henry Taylor Cummings, Liverpool University; Dennis Reginald Curnock, Charing Cross Hospital; William Leslie Dandridge, Cambridge University and St. Bartholomew's Hospital; Hari Das, Calcutta University and University College Hospital; Thomas Davies, University College, Cardiff, and University College Hospital; Leslie Perkins de Abrew, Ceylon Medical College and London Hospital; Bartholomew Gidley Derry, Bristol University; Wilton Lionel de Silva, Liverpool University; James Douglas Dimock, Sheffield University and Middlesex Hospital; John Stanley Ellis, Cambridge University and Guy's Hospital; Maximilian Walter Geffen, University College Hospital; Satyapriya Ghosh, Calcutta University and Royal Free Hospital; Edward Austin Gibb, Cambridge University and St. Thomas's Hospital; Johan Coenraad Gie, Guy's Hospital; *Charles Hawkins Gilmour, Toronto University and Middlesex Hospital; Lionel Charles Goument, St. Bartholomew's Hospital; Lilian Maud Griffiths, University College, Cardiff, and Royal Free Hospital; Douglas Vernon Halstead and Eric Clark Hinde, Guy's Hospital; Wilhelm Otto Holst, Middlesex Hospital; Percy Gilbert Horsburgh, St. Bartholomew's Hospital; *Reginald Hunter, Durham University; John Wilkinson Davis Hyde, University College Hospital; Clifford Venning Isard, St. Thomas's Hospital; Thomas Glyn James and Naunton Reginald Jenkins, University College, Cardiff, and Westminster Hospital; Montagu Horace Jupe, Cambridge University and London Hospital; Nai Kamchorn, Guy's Hospital; David John Adams Lewis, London Hospital; Emily Catherine Lewis, Royal Free Hospital; Thomas Parry Lloyd, London Hospital; Alice Lloyd Lloyd-Williams, Royal Free and St. Mary's Hospitals; Albert Victor Lopes, St. Bartholomew's Hospital; James Galway McCann, St. Thomas's Hospital; Joseph Sydney Matthews, London and University College Hospitals; Leslie Clifford Moore, Liverpool University and St. Thomas's Hospital; Arthur Harry Morris, Bristol University; William Percival Nelson, Birmingham University; Joseph Warren McKillop Nicholl, Cambridge University and Middlesex Hospital; William Drew Nicol, St. Bartholomew's Hospital; Francis Crawford Odling, Cambridge University and St. Thomas's Hospital; David Forsyth Panton, London Hospital; Christopher Stanley Parker and Reuben Woodland Payne, Charing Cross Hospital; Charles Farrell Rainer, London Hospital; Hallock Ratnarajah, Ceylon Medical College and St. Mary's Hospital; Frank Neon Reynolds, St. Thomas's Hospital; Herbert Eyton Rhodes, Cambridge University and London Hospital; Helen Roth, Birmingham University; Henry Bret Russell, St. Thomas's Hospital; Khan Sahib, St. Thomas's Hospital; John James Savage, Oxford University and St. Bartholomew's Hospital; Simeon Cyril Shaw, Middlesex Hospital; Cuthbert Shaw-Crisp, St. Mary's Hospital; Charles Ernest Alan Shepherd, St. George's Hospital; Charlotte Annie Shields, Royal Free Hospital; Maurice Oliver Simpson, Middlesex Hospital; Ram Sinha, London Hospital; Basil Lyndon Skeggs, St. Bartholomew's Hospital; Robert Cyril Wilmer Staley, Guy's Hospital; Harman Taylor, Liverpool University; Harold George Taylor, Cambridge University and St. George's Hospital; Oswald Stuart Thompson, Cambridge University and St. Thomas's Hospital; John Ferdinand Twort, London Hospital; Percy Ward, Sheffield University; Charles Horne Warner, Middlesex Hospital; Arthur William Wells, London Hospital; Arthur Winfield, Cambridge and Liverpool Universities; Keith Montague Cumberland Woodruff, Guy's Hospital; and Ephraim Benjamin Woolf and Israel Hyman Zortman, London Hospital.

* M.R.C.S. granted Oct. 11th last.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—The annual meeting of the Fellows and Members of the College was summoned for 3 o'clock on Thursday, Nov. 15th, when the senior Vice-President, Mr. Charters J. Symonds, took the chair only some 15 Fellows and Members were present, though the quorum is 30. When a quarter of an hour had elapsed and still those present had not reached the required number, the Vice-President declared that as a quorum had not attended it was his duty to state that the meeting could not be held. Last year no quorum was present, but an informal discussion was held on the annual report of the Council. It had been suggested that no meeting should be summoned this year as so many of the Fellows and Members of the College are serving in the Army and Navy; and, indeed, the Society of Members advised the Council not to have the meeting, but after discussion it was resolved that an attempt should be made. As the event has shown, it has proved a failure. While the meeting was waiting the necessary 15 minutes a Member present asked the chairman whether the members of Council present were counted in the total, and he was told that the two members of the Council who were present were included.—At the Primary Examination in Anatomy and Physiology for the Fellowship held on Nov. 7th, 8th, and 13th, for which 25 candidates presented themselves, 12 candidates (including four ladies) were successful and 13 were rejected. The following are the names and schools of the successful candidates:—

Michael Waldo Boone Bulman, London Hospital; Rustam Nusserwanji Cooper, Bombay University and Middlesex Hospital; Hilda Treloggen Haggett and Edith May Hall, London School of Medicine for Women; Henry Lewis Heimann, University College and Middlesex Hospital; Oscar Stanley Hillman, Middlesex Hospital; Charles Melton Ockwell, Guy's Hospital; Dorothy Pantin, London School of Medicine for Women; Robert Lindsay Rea, Queen's University, Belfast, and Middlesex Hospital; Esther Rickards, London School of Medicine for Women; William George Dismore Upjohn, Melbourne University and Middlesex Hospital; and John Whittingdale, Cambridge University and St. Bartholomew's Hospital.

UNIVERSITY OF LONDON.—At examinations held recently the following candidates were successful:—

THIRD (M.B., B.S.) EXAMINATION FOR MEDICAL DEGREES.

Arthur Lawrence Abel, University College Hospital; Frank Macdonald Allchin, Westminster Hospital; Hannah Katherine Alton, London School of Medicine for Women; Elizabeth Labrey Ashby, University of Birmingham; Robert Townly Bailey, Charing Cross Hospital; Marjorie Ada Blandy, London School of Medicine for Women; Marian Noel Bostock, St. George's Hospital and London School of Medicine for Women; Margaret Stote Glen Bott, London School of Medicine for Women; Francis Caldecott, Guy's Hospital; Hari Das, University College Hospital; Thomas Anwyl Davies, St. Thomas's Hospital; Phillis Decima Dixon, London School of Medicine for Women; William Henry Dupré, St. Bartholomew's Hospital; Kenneth Reed Hill, University College Hospital; Bertha Hinde (honours, distinguished in Surgery), London School of Medicine for Women; Harry Mainwaring Holt, University of Leeds; Henry Cecil Jennings, St. Thomas's Hospital; William Arthur Edward Karunaratne, University College Hospital; Walter Henry Lloyd, Middlesex Hospital; Bruce Maclean, University College Hospital; Sinnethamby Muttiah, London Hospital; Martin Herbert Oldershaw, University College Hospital, Noel Olivier, London School of Medicine for Women; Alexander Edward Patrick Parker (honours, distinguished in Medicine and Surgery) (University Medal), Westminster Hospital; Mariamne Olive Ramsay, London School of Medicine for Women; Cedric Sydney Lane Roberts, Guy's Hospital; Kenneth Mackinnon Ross, London Hospital; Henry Rowan and Morris Schwartz, University College Hospital; Simeon Cyril Shaw, Middlesex Hospital; Ellen Sylk, London School of Medicine for Women, and Charles Horne Warner and Ralph Edwin Stuart Webb, Middlesex Hospital.

The following candidates have passed in one of the two groups of subjects:—

Group I.—Ruth Balfour, London School of Medicine for Women; Guy William John Bousfield, St. Thomas's Hospital; Percy Selwyn Clarke, St. Bartholomew's Hospital; Humphrey Leonard George Foxell, University College Hospital; Blanche Aspasie Marion Henderson, Victoria University of Manchester and Charing Cross Hospital; Claude Herbert Marshall, Guy's Hospital; Marie Matilda Alice Moralt, London School of Medicine for Women; Alan Selby-Green, Middlesex Hospital; Aubrey Leonard Telling, University of Leeds; and James de Silva Wijeyeratne, University College Hospital.

Group II.—Frank Percy Bennett, St. Mary's Hospital; Lionel Bernard Goldschmidt, King's College Hospital; David John Adams Lewis, London Hospital; William Leslie Thomas, Middlesex Hospital; and Naomi Tribe, London School of Medicine for Women.

B.S. EXAMINATION (*For Students who graduated in Medicine in or before May, 1904*).

Henry Harold Greenwood (honours), University of Leeds.

EXHIBITION OF ARTS AND HANDICRAFTS.—The Exhibition of Arts and Handicrafts which has recently been held at the Central Hall, Westminster, showed by a useful and artistic display that village industries have by no means died out, and demonstrated the possibilities of accelerating their revival as a means of helping our crippled sailors and soldiers. There were instructive exhibits of handweaving, stained glass, pottery, embroidery, lace, metal-work, bookbinding, basket-work, and so forth, by both individual exhibitors and societies, the latter including the National Institute for the Blind, which is doing so much at the present moment for blinded sailors and soldiers, the Wych School for the Deaf, Hampstead, N.W. (after Christmas the institution will remove to Haslemere), and the Barclay Workshop for Blind Women, Edgware-road. Specimens of the work done by members of the interned Naval Brigade in Holland and by the blinded sailors and soldiers at St. Dunstan's Hostel were of particular interest, as were also the models of the Maternity and Nursing Departments at the Royal Free Hospital, which had been mainly constructed by the sailor and soldier patients who have been wounded in the

war. Many of the articles were sold for the benefit of the wounded. The catalogue constitutes a useful work of reference with regard to what is being done and what can be done to restore something of the old industrial life of the country.

ROYAL INSTITUTION OF GREAT BRITAIN.—Professor J. A. Fleming, D.Sc., F.R.S., will deliver a Christmas course of six illustrated lectures (adapted to a juvenile auditory) on "Our Useful Servants: Magnetism and Electricity." The subjects and dates are as follows: Magnets and the Magnetic Compass, on Dec. 27th; Electricity and Electric Currents, on Dec. 29th; the Electric Current as a Heater and Chemist, on Jan. 1st; Electricity as an Illuminator and Doctor, on Jan. 3rd; Electric Dynamos, Motors, Transformers, and Railways, on Jan. 5th; Electric Telegraphs and Telephones, on Jan. 8th. The subscription for non-members to this course is one guinea for adults, but for those under 16 half-a-guinea. Tickets may now be obtained at the office of the institution, 21, Albemarle-street, W.

WEST LONDON MEDICO-CHIRURGICAL SOCIETY.—At a meeting of this society to be held at the West London Hospital on the evening of Friday, Dec. 7th, at 8.30 P.M., papers will be read as follows: (1) "The Methods of Detecting Simulated Deafness," by Mr. Richard Lake; (2) "The Methods of Detecting Simulated Blindness," by Mr. Percy Dunn. Mr. Mark Hovell, Mr. A. Bruce Roxburgh, Mr. Herbert Tilley, Mr. J. F. O'Malley, Colonel E. M. Wilson, Major Goldsmith, and Captain McCulloch are expected, among others, to take part in the discussion. Any Service medical officers or any other medical men interested in the subject of the detection of malingering are invited to take part.

THE SALARIES OF POOR-LAW MEDICAL OFFICERS.—The Poor-law Union Association has considered the following resolution transmitted by the Shipston-on-Stour board of guardians:—

That the Local Government Board be requested to rescind the Order which compels all boards of guardians to pay their medical officers at least the same salaries as those at which they were appointed, although their work has been very largely reduced, and this board earnestly solicits the help of the Association of Poor-law Unions to secure this alteration, which they have proved by experience will not only save the taxpayers many thousands of pounds a year, but also enable all boards of guardians to give medical relief to old-age pensioners and others without tainting them with pauperism.

The council of the association has disagreed with the resolution, being of opinion that the suggested arrangement was not economically sound as a matter for general adoption.

ROYAL permission has been granted to Mr. James Berry, F.R.C.S., to wear the Insignia of the Fourth Class of the Order of the Star of Roumania (with swords) conferred upon him by the King of Roumania in recognition of his services in that country under the auspices of the British Red Cross Society and the Order of St. John of Jerusalem in England during the present war. Mr. Berry has also received similar permission to wear the Insignia of the Third Class of the Order of St. Sava conferred upon him by His Majesty the King of Serbia in recognition of services which he had previously rendered to the Serbian sick and wounded.

Dr. Walter Henry Pollard has been elected Mayor of Smethwick.

THE SERVICES.

ROYAL NAVAL MEDICAL SERVICE.

To be temporary Surgeons: D. M. Black, F. L. H. MacDowel, R. Pollok, A. J. Pollock, E. A. Gibb.

The following appointments have been notified: Staff-Surgeons H. Cooper and R. McGriffin to the *Vivid*, additional, for disposal; Acting Staff-Surgeon D. R. D. Wilkie to the *Victory*, additional, for disposal; Surgeon A. J. Tozer to the *Powerful*. Temporary Surgeons: W. H. de Pre, to *Pembroke*, additional, for Chatham Hospital; A. T. Woodward to *Vivid*, for disposal; R. Pollock, to *Vivid*, additional, for Plymouth Hospital; A. J. Muirhead, to *Victory*, additional, for disposal; W. A. McKerrow, to *Victory*, for R.N. Division; H. L. G. Foxell, to *Victory*, for disposal; H. Rowan and A. L. Abel, to *Pembroke*, additional, for Chatham Hospital; E. F. Deacon, to Chatham Hospital; and H. B. Maitland, to Haslar Hospital.

ROYAL ARMY MEDICAL CORPS.

To be temporary Lieutenant-Colonels: Lieut.-Col. R. Bruce, D.S.O., Gordon Highlanders (T.F.), Temp. Major A. D. Reid, Major J. M. Cowan (T.F.), Temp. Major R. E. Wodehouse (Canadian A.M.C.).

Majors relinquishing the rank of temporary Lieutenant Colonel on ceasing to command a Training Centre: Bt. Lieut.-Col. B. A. Craig, A. N. Fraser, D.S.O.

Officers granted temporary rank whilst serving with the Staincliffe War Hospital:—As Major: J. Russell. As Captains: H. Keighley, G. S. Mill.

To be acting Lieutenant-Colonels whilst in command of a Medical Unit: Major R. N. Woodley, D.S.O., Temp. Capt. A. Jones, M.C.

Temp. Capt. J. W. Ross, Canadian A.M.C., to be temporary Major.

Temp. Major H. A. Croll, from Canadian Reserve Cavalry Regiment, to be temporary Captain.

Temporary Lieutenants to be temporary Captains: R. R. Larmour (Canadian Army Dental Corps), A. H. L. Campbell (Canadian Army Dental Corps), D. S. Macbean, L. Pern, S. C. Shanks, J. Glaister, W. J. Poole, C. W. Macpherson, V. St. L. Pinnock, F. S. Poole, W. Lesey, E. A. C. Beard, R. Curle, N. Purcell, G. W. Harrison, E. R. Thompson, D. L. Carmichael, R. J. McFeeters, H. Heathcote, F. N. Marsh, J. L. Rubidge, P. A. Hall, C. L. McDonagh, H. T. Howell, E. A. Donaldson Sim, H. R. Grellet, A. H. Porter, J. Fanstone, J. B. Ferguson, G. F. Spicer, H. E. M. Baylis, A. S. Bradley (late Staff Surgeon, R.N.).

To be temporary Captains: H. S. Moore, C. D. Kean, S. Y. Wahl, A. G. Howson, G. B. Burwell, M.C., E. M. Eaton, J. G. Greenfield, A. C. Sturdy, M.C., A. L. Gwiney (South African Medical Corps), A. H. Lawrence (South African Medical Corps).

H. D. Welply, late temporary Captain, is granted the honorary rank of Captain.

To be Second Lieutenant: G. Bidwell (South African Medical Corps).

To be temporary Lieutenants: C. W. S. Boggs, H. Parsons, H. Tipping, T. C. Graves, J. A. C. Smith, H. Love, W. H. Condell, N. S. Williams, H. S. Campion, J. B. McMorland, B. W. Skinner, D. McCormack, C. S. Attlee, H. F. Penman, W. H. Ogilvie, G. Hoffmann.

L. W. Darrah to be temporary honorary Lieutenant.

Officers relinquishing their commissions: Temp. Lieut.-Col. R. H. Starling, Temp. Lieut.-Col. J. H. Brooks (on account of ill-health), Temp. Major Sir V. Nash. Temp. Capts. J. Todd, D. R. McGregor, S. W. Fisher, W. O. Arnold, M. W. Robertson, J. C. King, L. A. Moore, C. J. Gibson, W. B. Heywood, A. R. Wight, C. G. L. Wolf, C. W. Chapin, T. Woodman, A. Darlow, H. B. Brown, J. T. Hurst, C. S. Kingston, R. C. Thomas, R. Kennon, J. Fleming, E. W. Aiment, W. G. Liddiard, R. Park, M. R. Mackay, J. A. Smith, M.C., W. G. T. Hepplewhite, M.C., P. J. O'Reilly, M.C., D. K. Parkes, M. P. Scanlon, F. A. Murray, J. C. D. Simpson, C. Sand, S. Samuel (on account of ill-health contracted on active service), J. S. Stewart. Temp. Hon. Capt. H. T. Thomson (having ceased to be employed with No. 11 Stationary Hospital). Lieuts. F. H. P. Willis, J. L. Scott, J. McC. Gibson, W. E. Canter, C. Hackney, W. W. Dempster, S. Nix, A. I. Slower, V. F. Kroenig-Ryan, E. Lachopelle. Temp. Lieut. R. Dunstan. Temp. Hon. Lieut. T. J. Blackshear (on account of ill-health).

SPECIAL RESERVE OF OFFICERS.

Lieutenants to be Captains: G. H. Rossdale, A. G. Anderson, E. Chapelle, F. J. C. Johnstone, J. Ratcliffe, J. Sellar, Norman B. B. Fleming, H. D. Brown, W. M. Cameron, J. Crerar, W. Donald, G. M. Hetherington, A. R. Hill, T. J. Honeyman, J. N. Jamieson, S. Johnstone, H. E. McCall, D. B. Robertson, J. Steel, H. W. Torrance, H. S. Walker, J. E. Bannen, J. Beveridge, A. La B. Clark, R. Cunningham, J. MacA. Mackintosh, J. Stirling.

To be Lieutenants: C. S. Baxter and W. Stansfield (from Manchester University Contingent, O.T.C.).

TERRITORIAL FORCE.

Lieut.-Col. E. J. R. Evatt to be temporary Colonel whilst holding the appointment of Assistant Director of Medical Services of a Division and to remain seconded.

Lieut.-Col. C. Averill, from Assistant Director of Medical Services, to be Lieutenant-Colonel.

Major (temp. Lieut.-Col.) F. W. Burton-Fanning relinquishes his temporary rank and is restored to the establishment.

Major (temp. Lieut.-Col.) R. M. West relinquishes his temporary rank on an alteration in posting.

Officers seconded for duty with a General Hospital: Major E. S. Cunliffe, Capt. P. R. Wrigley, Capt. W. J. S. Bythell, Capt. W. A. Hooton, Capt. H. H. Rayner.

Major C. S. de Segundo, from R.A.M.C., to be Major.

Major A. C. Hartley relinquishes his commission on account of ill-health and is granted permission to retain his rank and to wear the prescribed uniform.

Major T. M. Allison is seconded for service with a General Hospital.

Capts. A. B. Whitton and S. W. Plummer to be Majors.

Capt. C. G. Strachan, from Field Ambulance, to be Captain.

Capts. J. St. A. Titmas, G. S. Haynes, M. H. Way, W. E. Alderson and K. W. Monsarrat are restored to the establishment.

Capt. R. Gill resigns his commission.

Capt. W. Rogers, from R.A.M.C., to be Captain.

Capt. A. Don to be temporary Major whilst specially employed.

Capt. H. W. Beedman, M.C., to relinquish his commission on account of ill-health.

Capt. (temp. Major) R. M. Wilson and Capt. (temp. Major) W. E. Alderson relinquish their temporary rank on alteration in posting.

Capts. J. B. F. Wilson and J. Stokes are seconded for service with a General Hospital.

Major T. E. Hill (late R.A.M.C.) to be temporary Lieutenant-Colonel, County of Durham Medical Volunteer Corps.

Lieut. R. T. Forster (late R.A.M.C.) to be temporary Captain, East Yorkshire Medical Volunteer Corps.

S. J. Yeates (late Lieutenant, R.A.M.C.) to be temporary Captain, Lancashire Medical Volunteer Corps.

Major H. P. Berry (R.A.M.C., T.F., Reserve) to be temporary Major, Lincolnshire Medical Volunteer Corps.

J. C. French (late Surgeon-Lieutenant, 2nd Durham R.G.A. Volunteers) to be temporary Captain and Medical Officer, 2nd Battalion, Durham Volunteer Regiment.

Surgeon Lieutenant-Colonel Evan Evans (late Welsh Regiment) to be temporary Captain and Medical Officer, 1st Battalion, Carmarthenshire Volunteer Regiment.

G. L. Jones (late Lieutenant, R.A.M.C.) to be temporary Captain and Medical Officer, 1st Battalion, Anglesey Volunteer Regiment.

TERRITORIAL FORCE RESERVE.

Major B. Addenbroke, from R.A.M.C., to be Major.

Capt. E. B. C. Mayrs relinquishes his commission on account of ill-health, and is granted the honorary rank of Captain.

Capt. C. J. Coleman, from General Hospital, to be Captain.

Capt. J. Saffley, from Attached to Units other than Medical Units, to be Captain.

INDIAN MEDICAL SERVICE.

Capts. C. H. Reinhold, W. D. Wright, V. N. Whitamore, and W. Powell to be Majors.

Parliamentary Intelligence.

HOUSE OF COMMONS.

WEDNESDAY, NOV. 14TH.

Mortality amongst Children.

Mr. ANDERSON asked the President of the Local Government Board whether he could give the names of the insurance companies which opposed the passing of legislation to reduce the mortality among children; and, in view of the estimate of his predecessor that the lives of 52,000 children could be saved every year by such legislation, whether he intended to proceed with it in the present session.—Mr. HAYES FISHER answered: On Monday I indicated that my department has for some time been anxious to secure for local authorities in England and Wales the same powers in regard to maternity and infant-welfare work as are already possessed by local authorities in Scotland and Ireland, but that owing to opposition from insurance organisations the legislation has hitherto been delayed. The opposition to this Bill emanates from a body who have described themselves as representing the various types of Approved Societies and the Insurance Committees of England and Wales. I am not in a position to give the names of any individual insurance companies, neither do I know them.

Mr. J. H. THOMAS: Is the right honourable gentleman not aware that the majority of these societies are the trade unions and friendly societies who are anxious for the establishment of a Ministry of Health with a view to dealing with this question, and that they are experiencing difficulties from the department with which the right honourable gentleman is connected?—Mr. HAYES FISHER: No, Sir; they are experiencing no difficulty whatever from the department of which I am president. These societies are opposing this particular Bill because they desire to deal with the larger question of a Ministry of Public Health. On the other hand, my department urges that we should use the powers which we have or which we could easily have in our possession and that will not in any way prejudice the ultimate consideration of the larger question of the Ministry of Health.

Mr. THOMAS: Is the right honourable gentleman not aware that it is felt that it will prejudice it, and that trade unions and friendly societies are opposed to maternity being handed over to what are nothing more than Poor-law associations?—Mr. HAYES FISHER: It is a matter of opinion as to whether the settlement of the smaller question would prejudice the settlement of the larger question. Our opinion is that the authorities in England and Wales ought to be possessed of the same powers now possessed by the local authorities in Scotland and Ireland. If they were possessed of those powers they could make rapid and vigorous use of them, and if they could make rapid and vigorous use of them it would largely reduce the rate of mortality.

Mr. ANDERSON: Does the right honourable gentleman see any chance of agreement on this question, seeing that while this quarrel goes on 50,000 children are being killed every year?—No reply was given.

Detention of Venereal Cases.

Mr. FINNEY asked the President of the Local Government Board whether his attention had been called to a resolution passed by the Wolstanton and Burslem union, Stoke-on-Trent, stating that, taking into account the fact that the Local Government Board was now prepared to sanction in Poor-law hospitals the treatment of venereal diseases and that persons entering such institutions to undergo such treatment had the power to take their discharge before a cure had been effected, the board of guardians was strongly of opinion that the recommendations of the Royal Commission on Venereal Diseases, and that of the Royal Commission on the Poor Law and Relief of Distress, should be carried into effect—namely, that, subject to certain safeguards against abuse, the public assistance authority should have power to detain cases of venereal disease, when medically certified to be dangerous to others; and whether he would indicate the intentions of the Government respecting the same.—Mr. HAYES FISHER wrote in reply: This question has been fully considered, but it is not the present intention of the Government to introduce legislation on the subject. It is felt that compulsory detention would deter many persons from seeking treatment, and hence it would do more harm than good. It would, moreover, in my opinion, be improper to distinguish between various institutions in this matter.

THURSDAY, NOV. 15TH.

Medical Students and Military Service: Important Announcement.

Mr. DILLON asked the Minister of National Service whether his attention had been drawn to the scarcity of medical men and to the danger that the supply of medical men after the conclusion of peace might for some years be wholly insufficient; and whether, in view of this state of things, he would see that no bona-fide medical student entered before Nov. 1st, 1917, was called up for military or any other service.—Sir AUCKLAND GEDDES replied: The outlook with regard to the supply of medical men and the question of military service as it affects medical students has been under my careful review. The general policy I have adopted is to aim at maintaining a minimum output of a thousand newly qualified medical men per annum. This year no improvement can be made. In 1918 and 1919 the output will be below the desired minimum, though, I hope, approaching it. Arrangements have already been made that students serving in the Army who have completed two years of medical studies and who had begun their studies prior to August 1st, 1914, may claim to be returned to their studies. The honourable Member's suggestions will be carefully considered in connexion with the general review.

Mortality amongst Children.

Mr. ANDERSON asked the President of the Local Government Board whether he had considered the problem of infant mortality in relation to the loss of life sustained in the war; whether he was aware that the future of this country was endangered by the needless sacrifice and maiming of infant life: whether he had made representations to the War Cabinet on this question; and, if so, whether he would continue to make representations until drastic action was taken.—Mr. HAYES FISHER wrote in reply: The answer to all the four parts of the question is in the affirmative.

National Insurance and Invalided Soldiers.

Mr. CHANCELLOR asked the representative of the National Insurance Commissioners whether he was aware that the London Panel Committee, representing the medical practitioners engaged in insurance practice in the metropolitan area, had advised their constituents to refuse to carry out the new regulations *re* invalided seamen, marines, and soldiers, issued by the Commissioners; and whether he could state the number of doctors who had notified the London Insurance Committee to this effect.—Sir E. CORNWALL wrote in reply: Since the date referred to in the question the London Panel Committee have been in communication with the Commissioners with a view to the elucidation of various points in connexion with the new regulations, and it is not, therefore, possible to know what course individual doctors in London may decide to adopt in regard to the matter referred to in the question.

MONDAY, NOV. 19TH.

Departmental Committee on the Blind.

Mr. ACLAND ALLEN asked the President of the Local Government Board whether any decision had been come to by the Cabinet as to carrying into effect the main recommendations of the Departmental Committee on the Blind (see THE LANCET, Oct. 27th, 1917, p. 654).—Mr. HAYES FISHER replied: Yes. The War Cabinet have decided to authorise the setting up of special departments in the Local Government Board and in the Local Government Board for Scotland respectively, and the establishment of an advisory committee for England and Wales and a separate advisory committee for Scotland.

TUESDAY, NOV. 20TH.

Medical Fees and the Coroners Act.

Mr. INGLEBY asked the Home Secretary whether he was aware that, in cases where a patient was brought into hospital in a moribund condition and a post-mortem examination had to be made and an inquest held, the medical officer who undertook the post-mortem and subsequently attended the inquest to give evidence was precluded by Section 2, Clause 22, of Part II. of the Coroners Act, 1887, from receiving any fee, whereas if the patient was dead before being received into hospital the medical officer was, under Section 1, entitled to receive £2 2*s.* for his services; whether he was aware that coroners had from time to time expressed their opinion in court of the injustice suffered by the medical profession in this matter; and whether he would introduce a short Bill repealing Section 2 of the Act above referred to.—Sir G. CAVE answered: The facts are as stated in the question, but I do not see my way to propose legislation on this subject at present.

URBAN VITAL STATISTICS.

(Week ended Nov. 17th, 1917.)

English and Welsh Towns.—In the 96 English and Welsh towns, with an aggregate civil population estimated at nearly 17,000,000 persons, the annual rate of mortality was 12·2, against 12·6 and 11·8 per 1000 in the two preceding weeks. In London, with a population exceeding 4,000,000 persons, the death-rate was 12·5 per 1000, and was equal to that recorded in the previous week; among the remaining towns the rates ranged from 5·2 in Swindon, 6·6 in Wimbledon, and 7·0 in Enfield, to 17·6 in Aberdare, 18·9 in Lincoln, and 20·9 in Hastings. The principal epidemic diseases caused 295 deaths, which corresponded to an annual rate of 0·9 per 1000, and included 95 from measles, 83 from infantile diarrhœa, 69 from diphtheria, 38 from whooping

cough, 9 from scarlet fever, and 1 from enteric fever. The deaths from measles, which had been 33, 56, and 70 in the three preceding weeks, further rose to 95, and caused the highest annual rates of 2·7 in Acton, 2·8 in Preston, 3·1 in Hastings and in Aberdare, and 4·6 in Stockton-on-Tees. The 1261 cases of scarlet fever and the 1487 of diphtheria under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital were respectively 75 and 18 above the numbers remaining at the end of the previous week. Of the deaths from all causes in the 96 towns 148 resulted from violence. The causes of 23 deaths were uncertified, of which 5 were registered in Birmingham and 3 each in Leicester and Liverpool.

Scotch Towns.—In the 16 largest Scotch towns, with an aggregate population estimated at nearly 2,500,000 persons, the annual rate of mortality was 11·9 per 1000 and was equal to that recorded in the previous week. The 243 deaths in Glasgow corresponded to an annual rate of 11·4 per 1000, and included 3 each from whooping-cough and diphtheria, 2 from measles, and 1 from infantile diarrhœa. The 70 deaths in Edinburgh were equal to a rate of 11·0 per 1000, and included 3 from scarlet fever and 1 from diphtheria.

Irish Towns.—The 129 deaths in Dublin corresponded to an annual rate of 16·9, or 2·0 per 1000 less than that recorded in the previous week, and included 6 from infantile diarrhœa and 1 each from enteric fever and measles. The 90 deaths in Belfast were equal to a rate of 11·9 per 1000, and included 1 death each from measles, whooping-cough, and infantile diarrhœa.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index).

When the application of a Belgian medical man would be considered the advertisers are requested to communicate with the Editor.

BOURNEMOUTH, ROYAL VICTORIA AND WEST HANTS HOSPITAL.—House Surgeon. Salary £175 per annum, with board, &c.

BRADFORD CITY.—Temporary Assistant School Medical Officer. Salary 8 guineas per week.

BRISTOL ROYAL INFIRMARY.—**House Physician and House Surgeon. Salary at rate of £120 per annum, with board, &c.**

DERBY, DERBYSHIRE ROYAL INFIRMARY.—House Surgeon. Salary £200 per annum, with board, &c.

DUMFRIES AND GALLOWAY ROYAL INFIRMARY.—Resident House Surgeon. Also Assistant House Surgeon.

HAMPSTEAD GENERAL HOSPITAL, Haverstock Hill, N.W.—Resident House Physician for six months. Salary at rate of £200 per annum.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton.—House Physician for six months. Salary 30 guineas.

ILFORD URBAN DISTRICT COUNCIL.—Temporary Medical Officer of Health. Salary at rate of £550 per annum.

KENSINGTON DISPENSARY AND CHILDREN'S HOSPITAL, 49, Church-street, Kensington.—Resident Medical Officer. Salary as arranged, with board, &c.

KENT EDUCATION COMMITTEE.—Temporary School Medical Inspector and Medical Officer of School Clinic. Salary at rate of £385 per annum.

LEICESTER ISOLATION HOSPITAL AND SANATORIUM, Groby-road.—Second Resident Medical Officer. Salary at rate of £300 per annum, with board, &c.

MANCHESTER, CITY EDUCATION COMMITTEE.—Temporary Assistant School Medical Officer. Salary £400 per annum.

NEW HOSPITAL FOR WOMEN, Euston-road.—Female House Physician, Obstetric Assistant, Two House Surgeons, all for six months. Salary at rate of £50 per annum, with board, &c. Also Resident Medical Officer at House of Recovery, New Barnet, for six months. Salary at rate of £60 per annum. Also Clinical Assistants and Anæsthetists.

QUEEN'S HOSPITAL FOR CHILDREN, Hackney-road, Bethnal Green, E.—House Surgeon for six months. Salary £100 per annum, with board, &c.

RECUPERATIVE HOSTELS (FOR SAILORS AND SOLDIERS INVALIDED FROM H.M. SERVICES WITH NERVE-STRAIN), 43-45, Fitzjohn's-avenue, N.W.—Honorary Neurologist and Honorary Laryngologist. Also Resident Medical Officer. Salary £400 per annum.

STOKE-ON-TRENT, COUNTY BOROUGH TUBERCULOSIS SANATORIUM.—Resident Assistant Medical Officer. Salary £250 per annum, with board, &c.

VICTORIA HOSPITAL FOR CHILDREN, Tite-street, Chelsea, S.W.—House Physician. Salary £200 per annum, with board, &c.

WARWICKSHIRE COUNTY COUNCIL.—Assistant County Medical Officer of Health. Salary £325 per annum.

WESTERN SKIN HOSPITAL, 44, Hampstead-road, London, N.W.—Vacancy on Honorary Medical Staff.

THE Chief Inspector of Factories, Home Office, S.W., gives notice of a vacancy for a Certifying Surgeon under the Factory and Workshop Acts at Coventry, in the county of Warwick.

Births, Marriages, and Deaths.

BIRTHS.

BARFF.—On Tuesday, Nov. 13th, at Rhosneigr, Anglesey, the wife of Lieut. G. P. Barff, R.A.M.C.—a daughter.

BLAKE.—On Nov. 17th, at Cambridge House, Portsmouth, the wife of Philip Blake, L.D.S. Eng., of a son.

LEECH.—On Nov. 18th, at High Elms Nursing Home, Manchester, Mary (*née* Walder), the wife of Captain E. B. Leech, R.A.M.C., of a daughter.

LUNN.—On Saturday, Nov. 17th, at Château de Crans, Dora (*née* van Berchem), the wife of Captain (temp. Lieut.-Col.) Lunn, M.C., R.A.M.C., of a son.

MOORE.—On Nov. 10th, at Mundens, Malmesbury, the wife of Reginald M. Moore, M.A., M.B., B.C., of a son.

SHINNIE.—On Nov. 13th, at Woodstock-avenue, Golders Green, N.W., the wife of Andrew J. Shinnie, M.D., D.P.H., of a daughter.

MARRIAGES.

BOLDERO—DUNN.—On Nov. 15th, at St. Peter's Church, Cranley-gardens, S.W., Captain Harold E. A. Boldero, R.A.M.C., to Marjorie Dunn, eldest daughter of Mrs. Arthur Dunn, Elm Park-gardens, S.W., and the late Arthur T. B. Dunn, of Ludgrove.

FOTHERINGHAM—BEATTIE.—On Nov. 14th, at St. Columba's, Pont-street, Captain James Bryan Fotheringham, R.A.M.C., to Mary, fourth daughter of Mr. and Mrs. James Beattie, of Canmore, St. Andrews, and Buckingham-street, Buckingham-gate, S.W.

NEIL—SHARP.—On Nov. 19th, at the Parish Church, Bradford, Hugh Loudon Neil, Captain, R.A.M.C., T.C., to Annette Olivia, second daughter of Mr. and Mrs. Thomas P. McKie Sharp, of St. Albans.

RAWLING—LEAKE.—On Wednesday, Nov. 14th, at St. Mary's, West Winch, King's Lynn, Major Louis Bathe Rawling, F.R.C.S., R.A.M.C., T.F., to Emily Winifried, youngest daughter of Mr. and Mrs. H. A. Leake, of West Winch, King's Lynn.

WEAKLEY—RUFFER.—On Nov. 6th, at H.B.M. Consulate and St. Mark's Church, Alexandria, Arthur Leonard Weakley, Captain, R.A.M.C., to Honora Vere, second daughter of the late Sir Armand Ruffer, M.D., C.M.G., &c., and Lady Ruffer, of Ramleh, Egypt.

WINTER—KEWLEY.—On Nov. 15th, at the Wesleyan Church, Tipton, Captain A. G. Winter, R.A.M.C., to Alice H. Kewley.

DEATHS.

ANDERSON.—On Nov. 11th, at "Limehurst," Preston, Lancashire, Joseph Anderson, M.B., C.M.

BARNARD.—On Nov. 14th, at Boston, Lincs., of acute pneumonia, Annie Thompson Barnard, M.D., B.S. Lond., D.P.H. Camb., youngest daughter of the late William Barnard, of Harlow, Essex.

BROWN.—On Nov. 15th, at Southernhay East, Exeter, George Brown, M.R.C.S. Eng., aged 72.

BURD.—On Nov. 15th, at Newport House, Shrewsbury, Edward Burd, M.D. Cantab., Consulting Physician to the Salop Infirmary, aged 91.

FOX-RUSSELL.—On Nov. 6th, killed in action, Captain John Fox-Russell, M.C., R.A.M.C.

JONES.—On Friday, Nov. 16th, at East Meon, from cardiac failure, Josephine, beloved wife of Captain Edward T. Jones, R.A.M.C.

MACGREGOR.—On Nov. 15th, at Rose Cottage, Oswaldkirk, Malton, aged 62, Peter MacGregor, F.R.C.S. Ed., J.P., of Rashcliffe, Huddersfield.

PHILLIPS.—On Nov. 6th, killed in action, Captain Edwin Phillips, R.A.M.C.

RANSOME.—On Nov. 14th, at Queen Mary's Military Hospital, Whalley, Lancashire, Herbert Fullarton Ransome, Lieut., R.A.M.C.

SAWYER.—On Nov. 19th, at Bath, Ramon Alexander Sawyer, M.R.C.S., in his 54th year.

N.B.—A fee of 5s. is charged for the insertion of Notices of Births, Marriages, and Deaths.

EDITORIAL NOTICES.

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITOR," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention should be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

Lectures, original articles, and reports should be written on one side of the paper only, *and when accompanied by blocks it is requested that the name of the author, and if possible of the article, should be written on the blocks to facilitate identification.*

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers—not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

We cannot undertake to return MSS. not used.

Offices: 423, STRAND, LONDON, W.C. 2.

MANAGER'S NOTICES.

TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, London, W.C. 2, are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and *not* to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

TO COLONIAL AND FOREIGN SUBSCRIBERS.

Subscribers abroad are particularly requested to note the rates of subscriptions given on page 6.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the rates shown, whatever be the weight of any of the copies so supplied.

Notes, Short Comments, and Answers to Correspondents.

A CURIOUS ACTION OF MERCURY ON ALUMINIUM.

To the Editor of THE LANCET.

SIR,—I shall be much obliged if you can give me any information explanatory of the following. The other day when making some liq. hyd. perchlor. I used an aluminium spatula in transferring the dry salt to the scale-pan, and also, by chance, an aluminium funnel in introducing it into the bottle. About an hour later I found the funnel choked with a white powdery substance, but washed it out without paying much attention. The next day I noticed on the end of the spatula, which had been laid down unwashed, an extraordinary *growth*, there is no other word for it, of white fibrous-looking substance. There were strands of it 3 to 4 inches long and ¼ inch thick, curling about the end of the spatula, and looking like the white ash of pieces of burnt string. The substance was extremely light, a breath blowing it away, and the cloud of fine powdery fumes resulting was distinctly irritating to the throat, and, I thought, produced some headache and nausea. Subsequent experiment showed that the minutest particle of dry $HgCl_2$, the finest dust of it, if placed on a surface of aluminium, produces in a few minutes a growth of this fine fibrous-looking, ash-like substance. So rapid is the growth that the movement is distinctly visible, and within half an hour a pillar 2 or 3 inches long projects, curving into all sorts of queer shapes if unsupported. It reminded me of the "serpent egg" pills of my boyhood, which, when ignited on a saucer, projected a curling ash representing a serpent. The surface of aluminium is rapidly corroded away in the process. I presume that an aluminate of mercury is formed in this reaction, but I can find no mention of it in books that I have, and an old and experienced dispensing chemist to whom I showed the experiment was equally unfamiliar with it.

Aluminium is so much used nowadays that it seems to me to be worth knowing that the slightest dust of corrosive sublimate on its surface produces this rapidly growing mass of powdery substance, which, at any rate in my case, was irritating and noxious. I produced a really extraordinary growth by dusting over an aluminium medicine cup with the powder and standing it under a glass case for 48 hours.

I am, Sir, yours faithfully,

Bromsgrove, Nov. 2nd, 1917. H. CAMERON KIDD.

*** Our consulting chemist has confirmed these interesting observations; the phenomenon is remarkable, and is correctly described in detail by Dr. Cameron Kidd. We note, however, that this peculiar reaction is described in some of the modern text-books on chemistry. Thus in "Inorganic Chemistry," by F. S. Kipping and W. H. Perkin (London: W. and R. Chambers), the following paragraph on aluminium amalgam appears (p. 612): "When a little mercury is placed on a bright sheet of aluminium and well rubbed on the sheet with a damp rag, the aluminium becomes coated with a thin film of mercury. By breathing on the sheet, and thus forming a film of moisture, a chemical action is set up; the aluminium dissolved in the mercury decomposes the water, giving aluminium hydroxide which rises as a bulky white powder from the surface of the metal." This seems to us to be the phenomenon described by our correspondent.—ED. L.

AN ARTISTIC ALMANAC FOR 1918.

Messrs. Abdulla and Co. have published an almanac from the sale of which it is hoped that at least £1000 will be realised for the funds of the British Red Cross Society. On each of 12 sheets is a monthly calendar and a picture representing some British sport typical of the month. The contributing artists in black and white are Mr. Maurice Greiffenhagen, A.R.A., Mr. W. Hatherell, R.I., Mr. Fred Leist, R.B.A., Mr. Frank Reynolds, R.I., Mr. Harry Rountree, and Mr. Joseph Simpson, R.B.A. The artists in colours are Mr. Christopher Clark, R.I., Mr. Lionel Edwards, A.R.C.A., Mr. Frank Gillett, R.I., Mr. Gilbert Holiday, Mr. C. M. Padday, and Mr. Bernard Partridge. Copies of the almanac may be obtained from any tobacconist, or post free from Messrs. Abdulla and Co., 173, New Bond-street, W.1, price 1*s.* 4*d.*

DRUG HABITUÉS IN NEW YORK.

A RECENT weekly bulletin of the Department of Health, City of New York, gives reasons for believing that the number of drug habitués in the city runs into thousands. Years ago the chief habit-forming drug in use was opium and its derivative morphine. Subsequently cocaine was extensively used, so much so, in fact, that the words *coke*, *happy dust*, and *sniffing* came into common use. In recent years, however, a change has taken place and cocaine is at present little used by the drug habitués. Whether this is due to the legal restrictions on the sale of cocaine or to a change in taste on the part of the habitués, cannot be determined. Over 90 per cent. of the drug habitués now make use of heroin, mostly hypodermically, but frequently also by snuffing. The Department of Health provides under the new State Narcotic Law for the commitment to an institution until "sufficiently treated" of any person voluntarily applying for treatment for drug addiction. During the first month after the announcement was made the number of applicants was 62, of whom 54 were men and 8 women.

A Medical Student (*Canada*) is advised to consult one of his teachers, to whom, in case of difficulty, we shall be glad to lend any assistance in our power.

C. E. W.—Fees are not paid in the circumstances mentioned to medical officers of institutions, although the fairness of this proceeding has often been questioned. It would not be advisable, if a similar case should arise, to refuse to give evidence, at any rate unless the authorities of the institution are prepared to endorse such a course.

C. E. S.—Officers of the Royal Army Medical Corps and civilian practitioners in military employment are forbidden by the Army Council to give certificates prejudging the fitness or unfitness of men for military service, but they may supply their patients with statements describing their physical condition or medical history for the information of the medical boards.

Medical Diary for the ensuing Week.

SOCIETIES.

ROYAL SOCIETY OF MEDICINE, 1, Wimpole-street, W.

MEETINGS OF SECTIONS.

Tuesday, Nov. 27th.

MEDICINE (Hon. Secretaries—Charles R. Box, W. Cecil Bosanquet): at 5.30 P.M.

Short Papers:

On the Manifestations of Serum Disease which may follow Intrathecal Injections.

Friday, Nov. 30th.

EPIDEMIOLOGY AND STATE MEDICINE (Hon. Secretaries—William Butler, Major Greenwood): at 5 P.M.

Paper:

Surg.-Colonel V. Soubbotitch (of the Serbian Army): A Pandemic of Exanthematous Typhus in Serbia in 1914 and 1915.

LECTURES, ADDRESSES, DEMONSTRATIONS, &c.

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C.

Course of Lectures on the Anatomical and Physiological Principles underlying the Treatment of Injuries to Muscles, Joints, and Bones:—

MONDAY.—5 P.M., Lecture II.:—Prof. A. Keith: The Principles and Practice of John Hilton.

WEDNESDAY.—5 P.M., Lecture III.:—Prof. A. Keith: The Principles and Practice of H. O. Thomas.

FRIDAY.—5 P.M., Lecture IV.:—Prof. A. Keith: The Methods applied by G. F. Stromeyer, W. Adams, and J. Wolff.

The Lectures will be illustrated by specimens from the Army Medical Collection now on exhibition in the Museum and also by specimens from the College Collection.

POST-GRADUATE COLLEGE, West London Hospital, Hammersmith-road, W.

MONDAY.—2 P.M., Medical and Surgical Clinics. X Rays. Mr. Gray: Operations. Mr. B. Harman: Diseases of the Eye. Dr. Simson: Diseases of Women.

TUESDAY.—2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. Dr. Banks Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin.

WEDNESDAY.—10 A.M., Dr. Arthur Saunders: Diseases of Children. Dr. Banks Davis: Operations of the Throat, Nose, and Ear. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations.

THURSDAY.—2 P.M., Medical and Surgical Clinics. X Rays. Mr. Gray: Operations. Mr. B. Harman: Diseases of the Eye.

FRIDAY.—10 A.M., Dr. Simson: Gynæcological Operations. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. Dr. Banks Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin.

SATURDAY.—10 A.M., Dr. Arthur Saunders: Diseases of Children. Dr. Banks Davis: Operations of the Throat, Nose, and Ear. Mr. B. Harman: Eye Operations. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N. 15

MONDAY.—2.30 P.M., Children's Diseases: Dr. T. R. Whipham. Gynæcological Diseases: Mr. F. L. Provis. Surgical Operations: Mr. E. Gillespie. 3 P.M., Medical In-patients: Dr. R. M. Leslie. 7 P.M., Venereal Clinic: Dr. Kinsella.

TUESDAY.—10 A.M., Surgical Operations: Mr. J. Howell Evans. 2.30 P.M., Medical Out-patients: Dr. A. G. Auld. Surgical Out-patients: Mr. Howell Evans. Nose, Ear, and Throat Diseases: Mr. C. H. Hayton. X Rays: Dr. Metcalfe. 3.30 P.M., Special Demonstration:—Dr. A. J. Whiting: Selected Medical Cases, Auricular Flutter.

WEDNESDAY.—2.30 P.M., Medical Out-patients: Dr. T. R. Whipham. Diseases of the Skin: The Dermatologist. Eye Diseases: Mr.

A. S. Worton. Operations:—Nose, Ear, and Throat: Mr. Hayton; 4 P.M., Eyes: Mr. Worton. 5 P.M., Venereal Clinic: Mr. E. Gillespie and Mr. Benians.

THURSDAY.—2.30. P.M., Medical Out-patients, Dr. A. J. Whiting. Surgical: Mr. H. W. Carson. X Rays: Dr. Metcalfe. Gynæcological Operations: Dr. A. E. Giles. 3.30 P.M., Medical Inpatients: Dr. R. M. Leslie.

FRIDAY.—2.30 P.M., Surgical Out-patients: Mr. Gillespie. Eye Diseases: Mr. A. S. Worton. 7 P.M., Venereal Clinic: Mr. E. Gillespie and Mr. Benians.

SATURDAY.—2.30 P.M., Surgical Operations Mr. H. W. Carson.

METEOROLOGICAL READINGS.

(Taken daily at 8.30 a.m. by Steward's Instruments.)

'Bynogen'

Trade Mark

Brings Health

The Improved Casein-Glycerophosphate Food

Recommended in all Enfeebled Conditions, Mental and Nervous Exhaustion, Insomnia, Convalescence after Illness, etc.

"Bynogen" is a highly concentrated food of acknowledged value. It is specially rich in phosphorus, which is present in the condition in which it is found in brain substance and other nervous tissues.

Formula :

Pure, Soluble Milk Protein - 75 per cent. Sodium Glycerophosphate 2 per cent.
Dextrin-Maltose (specially prepared) 20 ,, Calcium Glycerophosphate 2 ,,
Magnesium Glycerophosphate 1 per cent.

Advantages :

Physical.

Possesses a most attractive flavour and aroma, mixes readily with milk, water, and other fluids. May be eaten dry, if desired, or sprinkled on articles of solid food. Keeps good indefinitely.

Therapeutic.

The percentage of Nitrogen is high. The Carbohydrate is in the most easily assimilable form. The mixed Glycerophosphates present the inorganic bases common in food-stuffs and do not cause constipation.

Medical Men are invited to write for samples of this unique Nutrient and Nerve Restorative.

Obtainable from all Pharmacists, in bottles with cartons at 1/9 and 3/- each.

Sole Manufacturers:

Allen & Hanburys Ltd., Lombard Street, London, E.C. 3.

West End House : 7, Vere Street, Cavendish Square, W. 1.

[See also page 25

LISTERINE

A trustworthy, unirritating solution composed of volatile and non-volatile antiseptics; extensively and satisfactorily employed in dilution up to 25% as a wet dressing for surgical and accidental wounds.

LISTERINE

Suitably diluted, applied by injection, douche or spray, often serves a useful purpose in catarrhs and conditions involving hyper-secretion from mucous surfaces. It is an efficient deodorizer.

LISTERINE

On account of its boric and benzoic acid constituents, forms a suitable lotion in dermatitis following vaccination. In various cutaneous disorders its use allays excessive itching or irritation, and promotes cleanliness while exercising its antiseptic effect.

Descriptive literature on request.

Battley's Solution of Opium.

Liquor Opii Sedativus

(BATTLEY)

THE OLDEST and still THE BEST Hypnotic and Sedative.

Advantages:

¶ May be given with the greatest safety, being pure and free from harmful matter.

¶ No disagreeable after-effects follow its use.

¶ Never varies in strength.

The *Medical Annual* writes:

"**Battley's Solution of Opium** is a common word in the Practitioner's vocabulary. It has gained its reputation by its intrinsic value as a remedy which contains all that is sedative and anodyne in opium without its resinous constituents, which are, therapeutically speaking, impurities."

Strength—Twice that of Tinctura Opii B.P. Usual Dose—5 to 15 minims.

Issued in 2 oz., 4 oz., 8 oz. and 1 lb. bottles.

NOTE.—We do not guarantee our preparations unless in original bottles with the autograph of Richard Battley over each cork and on the label, without which none is genuine.

Sole Manufacturers:

BATTLEY & WATTS, 18 Wellclose Sq., London, E.

Telegraphic Address: "Sedative, London." *Telephone:* Central 2183.

HOW THE VITAMINES WERE DISCOVERED.

The discovery of the **Vitamines** was brought about by investigating the cause of Beri-Beri, a disease which was very prevalent in the Malay Peninsula and other countries where rice is the staple article of diet. The rice grain consists of an inner part and an outer husk. In polished rice the outer husk is removed and the natives, who lived chiefly on such rice, suffered from Beri-Beri. It was found that the additions of the husk, or the substitution of unpolished for polished rice was sufficient to cure the disease. The symptoms of this disease are such as arise from peripheral neuritis, or atrophy of the peripheral nerves with subsequent degeneration of the muscles, including the heart muscle.

The "something" contained in the rice husk which prevents or cures Beri-Beri has been shown by Funk to consist of Vitamine. He has succeeded in extracting it from the rice husk in a more or less pure state.

VITAMOGEN stands alone as a means of supplying the **Vitamines,** and it must be remembered that **VITAMOGEN** not only contains all the essentials of a complete food, but enables the body to utilize other food to better advantage owing to the action of **Vitamine** as a ferment.

Vitamogen

Regd.

VITAMOGEN represents a highly Concentrated Food and contains the **Vitamines** in their natural and unchanged condition in combination with Fats, Proteids, and Carbohydrates—the whole constituting a Complete Food in a palatable and easily assimilable form.

VITAMOGEN is useful in any form of **Nervous Disease, Neurasthenia, Shell Shock, Hysteria,** immediately after operations when the stomach is in a very irritable condition owing to the effect of the anæsthetics, &c., **Anæmia, Nervous Dyspepsia** and all **Wasting Diseases, Influenza,** and for its great Tonic-effect in **convalescence after severe illness,** owing to its properties of aiding the body to form fresh tissues to replace those which have been wasted. Also for **Sleeplessness, Malnutrition,** and the **effects of overwork** and **Nervous Break-down.**

Free Samples are supplied to Medical Men. ***Vitamogen*** *is packed in two sizes—***2/-** *and* **4/6***—or in bulk for Hospitals. Literature on the* ***Vitamines*** *will be sent with Sample upon application.*

GOLD MEDAL, INTERNATIONAL CONGRESS OF MEDICINE, LONDON, 1913.

MIST. DAMIANÆ CO. (HEWLETT'S).

MIST. DAMIANÆ CO. (Hewlett's) will be found to possess all the properties of Damiana, viz :—Its alterative effects on the alimentary canal and tonic action upon the brain and nervous system generally. It is a well-known fact that exhaustion of the organs and tissues, neurasthenia, and premature decay, are far more prevalent at the present day than ever before. The causes are numerous and complex, but, perhaps, the principal reason is that multitudes have to toil harder with their brains than any previous race. The resulting cerebral anæmia is, therefore, one of the most general complaints in modern life. Not only is it found amongst the professional literary men, but busy merchants and overworked scholars are equally the subjects of enfeebled nerve power and deficient vitality.

In all these various forms of loss of nerve power MIST. DAMIANÆ CO. (Hewlett's) is a powerful remedy, relieving the exhaustion and conferring renewed capacity for mental and physical endurance.

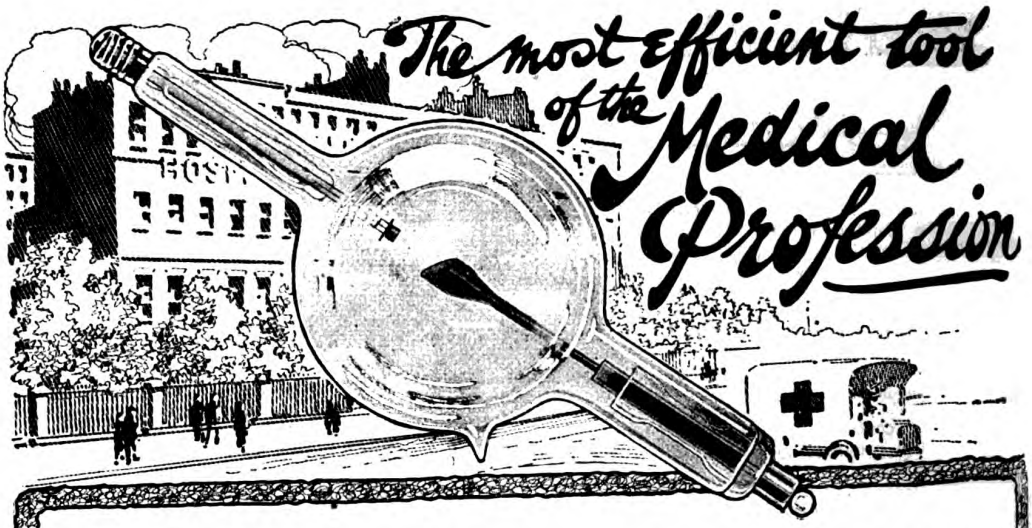
As a nerve tonic and brain stimulant it is unequalled, and its invigorating properties will be found invaluable in many diseases where there is great depression and exhaustion. In paraplegia, hemiplegia, and partial paralysis, it is particularly indicated, and may be suitably and satisfactorily employed wherever a powerful nerve stimulant and restorative are required.

Dose—One or Two Drachms in Water.

MEDICAL OPINIONS.

"I have tried your Mist. Damianæ Co. considerably in the dyspepsia of commencing phthisis, and can very strongly recommend its use in those cases. **It soothes the stomach wonderfully, and enables the patient to take more food whilst acting as a powerful stimulant in relieving exhaustion.**"—Yours faithfully, W. H. B——, B.A. (Cantab.), M.R.C.S., L.S.A.

THE MEDICAL ANNUAL.—"Damianæ is not used so frequently in this country as in America, where its value as a tonic for Neurasthenia is well known. Messrs. HEWLETT & SON put up a very excellent preparation of this drug, combined with Nux Vomica and simple aromatics and bitters, which is valuable for dispensing, and yields very satisfactory results in treatment."—1898.



Dr. M——, R.N., writes :— "Farnham (Hants.), Sept. 1903.

"I have frequently prescribed your Mist. Damianæ Co. and proved it efficient in treating Neurasthenia."

PRICE 11/- per lb. Packed in 10-oz., 22-oz., 40-oz., and 90-oz. Bottles.

Introduced and Prepared only by—

C. J. HEWLETT & SON, LTD., 35 to 42, Charlotte St., LONDON, E.C.

The Coolidge Tube represents the most recent and revolutionary advance in X-Ray science.

Radiologists now have at their command a high-power tube capable of continuous operation without change in intensity or character of the rays.

The

COOLIDGE X-RAY TUBE

has proved its worth to the medical profession.

At a meeting of Members of the Royal Society of Medicine (*March*, 1916) it was said of the Coolidge Tube:

> **"We owe a great debt of gratitude to Mr. Coolidge for his invention ..... It is the most wonderful X-Ray Tube that has ever been constructed."**

The Coolidge Tube can be demonstrated by and obtained immediately from the principal dealers in X-ray apparatus.

"THE HOUSE FOR EVERYTHING ELECTRO-MEDICAL."

The Grevillite Therapeutic Incandescent Lamp
(PHOTOTHERAPY). PRICE COMPLETE - £15.

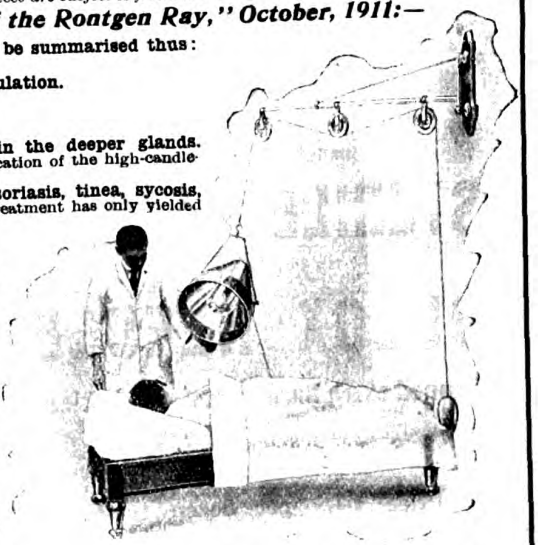
Owing to prevailing conditions our prices are subject to fluctuation.

The following is an extract from the "Archives of the Rontgen Ray," October, 1911:—

The physiological effects of this form of photo-therapy may be summarised thus:
1. Dilation of superficial vessels and glands.
2. Removal of venous stasis and promotion of normal circulation.
3. A bactericidal action on superficial germs.

And as a practical result of these principles we get—
1. Relief of pain.
2. Restoration of functional activity both in the skin and in the deeper glands.

It will be easily seen how broad a field there is for the clinical application of the high-candle-power lamp, and how many indications there are for its use.



In the treatment of some skin diseases, notably acne, eczema, psoriasis, tinea, sycosis, syphilitic and other ulcers, I have found this succeed where other treatment has only yielded disappointing results.

In the relief of pain I think this form of treatment stands pre-eminent in the armament of the modern electro-therapeutist. I venture to assert that where after a scientifically applied exposure to this light no relief is obtained, it may be taken that the case should be promptly referred to the surgeon. And there are some cases where the light will cause the pain to become more acute; this differentiates those cases of retained, walled-in pus which have gone beyond the power of phagocytes and opsonins, and which call for immediate operative interference.

The cases of pain which are more particularly benefited are rheumatic and rheumatoid disease, sciatica and other forms of neuritis, lumbago and the varying conditions which are classed under that generic term, and certain functional diseases of the digestive system, especially gastric irritability and pain.

In certain classes of neurasthenia and insomnia, the light passed up and down the spine for ten or twelve minutes, and then applied for a similar period to the abdomen, will produce a marked relief, and eventually a cessation of all symptoms.

In addition to its power of curing obstinate acne, the light will in many cases abort a bubo or carbuncle before the pus has formed in any great quantity. In those cases it is a great aid as a diagnostic agent, for if the pain be relieved within ten or twenty minutes it is certain that repeated applications will effect a cure; whereas if the pain becomes worse—and this will occur in the first few minutes—it is certain that nothing but the surgeon's knife will relieve the condition.

A really Universal Light and Heat Apparatus for the treatment of any part of the body.

NOTE.—For further particulars see separate pamphlet.

A Government Decree

Our fighting men—by Government decree—wear pure wool next the skin. Medical opinion upholds this command—the health of the men proves its value.

For fifty years doctors have advised Wolsey because it is *pure wool*. To-day, though wool is scarce and dear, Wolsey remains pure wool—untampered with, uncheapened in its quality. Forced upwards by the increased cost of wool, the price of Wolsey has risen. But Wolsey is worth its extra cost.

Wolsey

Pure Wool Underwear

The Wolsey machinery is busily engaged in making underwear for the troops—their urgent needs come first. Wolsey should now be ordered in advance to ensure supply. Wolsey garments are made for men, women, and children. Any garment found to shrink is replaced free of cost.

BLENOSAN
CAPSULES

As a routine
treatment for

GENITO-URINARY CONDITIONS.

BLENOSAN is a mixture of the finest East India Santal Oil with a specially prepared fluid extract of Kava-Kava. It is presented in the form of accurately-measured Capsules, and affords an ideal medicament for the treatment of all inflammatory conditions of the urethra.

BLENOSAN is an improvement upon the ordinary Santal, and the full proportion of the alpha resin of Kava-Kava ensures all the anæsthetic and diuretic properties of the root in a standardised and dependable form.

BLENOSAN CAPSULES consequently are indicated in all pathological conditions which affect the genito-urinary system, including acute Cystitis, Vaginitis, and Leucorrhœa, and where intense hyperæmia and swelling of the mucous membrane give rise to a diminution of the urinary canal.

BLENOSAN CAPSULES are well adapted for the continuous and systematic treatment of such cases, and are being used with excellent results by many of the most experienced and successful Physicians.

BLENOSAN CAPSULES can be prescribed for a course of treatment extending over two or three weeks.

"Eminent authorities may differ materially upon certain points, but when all agree upon one opinion, the latter cannot fail to carry conviction and clinch a fact."

For fifteen years past the most eminent authorities of Europe and America have agreed, without a single dissenting voice, that no nutritive preparation is assimilated by the organism with the regularity, certainty, and rapidity of

Sanatogen

For the specific virtue of Sanatogen is something more than the sum of the action of its two component parts. Both these are of well-tried value, but in Sanatogen they are so blended and chemically combined as to form a new compound with properties exactly adapted to the wants of the human organism, and with quite unexpected therapeutic qualities.

Again and again has it been found—especially since the war began—that no mechanical mixture of these ingredients, no imperfect attempt to unite them organically, can result in such benefit to the patient as Sanatogen admittedly yields.

Sanatogen is now the absolute property of an all-British company, and is manufactured at Penzance by the original unique processes on which its efficacy depends.

Though the cost of manufacture has greatly increased, **the retail prices are unchanged**; and it is worth noting that these work out at only about sixpence per day for the usual dosage. We mention this because many physicians regard Sanatogen as an expensive product, though in reality it is cheaper in use than many less valuable preparations which are not so regarded.

For Samples and Literature apply to

GENATOSAN, LTD.

(British Purchasers of the Sanatogen Co.)

Chairman: Lady Mackworth.

12, CHENIES ST., LONDON, W.C. 1.

Sanatogen will later on be re-named "Genatosan" to distinguish it from so-called substitutes.

VALE OF CLWYD SANATORIUM

This Sanatorium (opened 1901) is established for the Treatment of Tuberculosis as carried out by Dr. OTTO WALTHER of Nordrach. It is situated in the midst of a large area of park-land, at a height of 450 feet above the sea-level, on the western slopes of mountains rising to over 1800 feet, which protect it from North and East winds and provide many miles of carefully graduated uphill walks—similar in character and extent to those at Nordrach.

Small rainfall. Porous subsoil. Large amount of sunshine. Electric Lighting and Hot Water Radiators in each room.
The physician himself was a patient at Nordrach.
For particulars, apply to GEORGE A. CRACE-CALVERT, M.B., &c., Llanbedr Hall, Ruthin, North Wales

MATLOCK SANATORIUM

Situated on the edge of the mountain limestone area of Derbyshire, over 700 feet above sea-level. The buildings face south and command beautiful views, while on the north and east they are sheltered by lofty hills. The surrounding country is well known for its great beauty and interest. The climate is dry and bracing. The buildings are lighted by electricity and heated by radiators.

Treatment is carried out on modern lines, all special methods being available in suitable cases. A new X-ray apparatus has been installed, and there is a complete equipment for the carrying out of up-to date methods in all Tubercular and other Pulmonary cases.

For particulars apply to FREDERICK KINCAID, M.R.C.S., L.R.C.P., Medical Superintendent, Matlock Sanatorium, Matlock, Derbyshire. Telephone and Telegraph: SANATORIUM, MATLOCK 22.

PENDYFFRYN HALL SANATORIUM

(NORDRACH-IN-WALES.)

Physicians: Dr. G. M. DOBSON and Dr. GERATY.

FOR THE OPEN-AIR AND INOCULATION TREATMENT OF ALL FORMS OF TUBERCULOSIS.

One of the first Sanatoria opened in the United Kingdom to carry out the treatment as practised at Nordrach. Carefully graduated walks rise through pine, gorse, and heather to a height of over 1000 feet above sea level, commanding extensive views of both sea and mountains. Sheltered from E. and N.E. winds. Climate mild and bracing. Small rainfall. Large average of sunshine. There are over five miles of walks in the private grounds. Rooms heated by hot-water radiators and lit by electric light.

Telegrams: "Pendyffryn; and Telephone: 20 Penmaenmawr. Apply, Secretary, Pendyffryn Hall, Penmaenmawr, North Wales.

By **R. EDELMANN**, Ph.D. Translated by J. R. MOHLER, A.M., V.M.D., and ADOLF EICHHORN, D.V.S.

"The publication of this book advances the whole question of hygienic meat-supply, and the system which it teaches should do much to bring the meat industry nearer to sanitary ideals."—THE LANCET.

London: J. & A. CHURCHILL, 7, Great Marlborough Street, W. 1.

The NORWICH

CREPE ✚ BANDAGE

SUPERIOR ENGLISH MANUFACTURE

Extremely elastic, but contains no rubber.

FAST WOVEN EDGES.

Invaluable for all binding purposes. Entirely displaces bandages of rubber and elastic web. Considerably more durable, although less than one-third the cost of rubber or elastic web. Varicose veins and other ailments requiring the use of bandages usually demand *warmth* as well as support. The Norwich Crêpe Bandages, containing wool, provide this warmth and do not absorb grease. May be thoroughly cleansed by the use of *hot* (not boiling) soapy water, with the addition of a little ammonia or soda. Healthy and comfortable to wear, giving the necessary firmness, yet yielding to every movement. Self-clinging and self-adjusting.

"It's the greatest comfort in the world for every case of Varicose Veins."

THE BANDAGE THAT CAN BE STERILIZED.

IMPORTANT.—The edges will not fray out nor ravel.

Made and supplied to the leading wholesale houses, neatly wrapped in labelled packages. Inexpensive and high in quality; universally commended by the medical and nursing professions. Send for prices and samples to the Sole Manufacturers:

THE NORWICH CRAPE CO. (1856), LTD.,
St. Augustine's Silk Mills, Norwich, Eng.

London buyers can obtain samples and prices from Mr. T. Eastaway, London representative, 7, Wool Exchange, E.C.2

Antikamnia Tablets

Strongly Recommended in:

INFLUENZA & LA GRIPPE

For the headache, pain, and general soreness give a five-grain Antikamnia Tablet crushed with a little water; if the pain is very severe two tablets should be given. Repeat every 2 or 3 hours as required. One single ten-grain dose is often followed by complete relief.

NEURALGIA

In the Treatment of Neuralgia and Myalgic Pains Antikamnia Tablets are not only palliative, but, along with other measures, assist in ultimate cures; they also have a field of use in Rheumatic and Gouty Affections. In Neurasthenia, Hysteria, and Migraine they are a valuable adjuvant to the other recognised therapeutic measures.

LARYNGEAL COUGH

Frequently remains after an attack of La Grippe, and has been found stubborn to yield to treatment. There is an irritation of the larynx, huskiness, and a dry and wheezing cough, usually worse at night. The prolonged and intense paroxysms of coughing are controlled by ANTIKAMNIA & CODEINE TABLETS, and with the cessation of the coughing the laryngeal irritation subsides.
Antikamnia Tablets are the least depressing of all the drugs that can exercise so extensive a control of pain, and also least disturbing to the digestive and other organic functions.

Analgesic. Antipyretic. Anodyne.

Antikamnia Preparations in 1-oz. packages only.

JOHN MORGAN RICHARDS & SONS Ltd.,
46-47, Holborn Viaduct, LONDON.

STOVAINE

THE LEAST TOXIC OF LOCAL ANÆSTHETICS

First Class Award for Liquors and Liquid Extracts and Pharmaceutical Preparations International Medical Exhibition, London, '81.

Battley's Liquors

First Class Award at World's Industrial Exposition, New Orleans, 1885, Bronze Medal, St. Louis, 1904.

The following preparations have for many years been used and prescribed by medical men; they are therefore thoroughly recommended both on account of their high therapeutical properties and their great purity as galenical preparations.

Liquor Opii Sedativus (Battley)
Dose: 5 to 15 minims.
The Oldest and still the Best Hypnotic and Sedative.
Twice the strength of Tinctura Opii B.P.
Safe in use. No disagreeable after effects.
Composition always reliable.

Liquor Cinchonæ Cord. (Battley)
Dose: 2 to 15 minims.
The most reliable preparation of Cinchona Bark.
Contains all the active principles of Yellow Bark.
Will remain unaltered for a great length of time, being free from starch, etc.

Liquor Cinch. Pallidæ (Battley)
Dose: 2 to 15 minims.
A well-known and useful preparation in Malarial Diseases and in Convalescence after Illness.
Does not disturb the stomach.

Liquor Secalis Cornuti (Battley)
Dose: 20 to 60 minims.
Pre-eminent among Ergotic Preparations for Purity and Strength, and has proved to be unrivalled in the following therapeutical actions:—As an Emmenagogue and Ecbolic, in Post Partum Hæmorrhage, as a Hæmostatic, etc.

Battley's Liquors are issued in 2 oz., 4 oz., 8 oz. and 1 lb. bottles.
They are prepared according to the original process of the late Richard Battley.

A few words to the Profession about Celesco

The New Food Beverage

WE wish to bring to the notice of the Medical Profession the new food beverage—**CELESCO.**

CELESCO possesses a particularly delightful flavour and is practically free from tannin. Its highly stimulating properties are largely derived from theobromine, the essential alkaloid of cocoa. Medical men will find this nourishing food beverage of great value in cases of digestive trouble.

CELESCO costs substantially less than tea, coffee, or cocoa, and when infused it makes an invigorating and very refreshing drink.

Sold by Chemists, Grocers, and Stores.
If unobtainable, apply direct to Celesco Department.

J. LYONS & CO. LTD.
CADBY HALL · KENSINGTON
London, W. 14.

Prescribed by the Medical Profession for 35 years.
The LANCET (London, Eng.) describes it as—" Mr. Benger's admirable preparation.

What BENGER'S FOOD *is*—

Benger's Food is the direct outcome of the pioneer work on Digestive Ferments, by the late Sir William Roberts, M.D., F.R.S., and the late Mr. F. Baden Benger, F.I.C., F.C.S., in 1880.

BENGER'S is essentially a food for physicians to use in the feeding of difficult cases and through the crises of illness. Briefly described, it is a farinaceous food, combining the natural digestive principles—Trypsin and Amylopsin. These become active as the Food is being prepared with fresh new milk.

The self-digestion thus resulting can be regulated to suit any degree of enfeebled digestion. At the same time, it conforms with the accepted principle that if the digestive system, however weak, can do any work at all, it should be given work to do to the extent of its powers.

Wherever there is a case of enfeebled digestion, there is a case for Benger's Food. It is admittedly the only Food which can be administered to give the digestive organs rest, or exercise regulated according to physical conditions.

BENGER'S Food

for INFANTS, INVALIDS, AND THE AGED,

is sold throughout the World by Chemists, &c., in sealed tins.

A physician's sample, with full particulars, will be sent post free on application to any member of the medical profession.

Bronchitis Winter Cough.

Angier's Emulsion is specifically adapted in a very direct manner to the treatment of Chronic Bronchitis. It corrects faulty assimilation of food, which is generally at the root of the malady, and by its soothing qualities allays the bronchial irritation. Harsh, rasping coughs and irritable coughs of the aged are relieved with gratifying promptness. One has only to witness the results produced in some severe cases to understand the widespread use of this remedy in Bronchitis. Indeed, many Medical Men now invariably prescribe Angier's Emulsion as a routine treatment for Chronic Bronchitis and Winter Cough.

ANGIER'S EMULSION

PETROLEUM WITH HYPOPHOSPHITES

A Doctor's Personal Trial.

Dr. —— begs to thank the Angier Chemical Co., Ltd., for their Angier's Emulsion, which he has taken with such decided benefit in troublesome Bronchial Catarrh that he is pleased to add his testimony as to its great value as a tonic, and to endorse every word of their prospectus as to its effects and advantages over other emulsions of fatty medicines, generally so nauseating, but in this case positively pleasant to take.

——, L.R.C.P., M.R.C.S.

Acute Catarrhal Tracheitis.

Dear Sirs,—For trial on my wife, who was suffering from an acute attack of catarrhal tracheitis, and over 70 years of age, you kindly sent me a large sample of Angier's Emulsion. I gave it in maximum dose an hour after breakfast time, once a day only. In ten days the awful tickling cough, which no drug or treatment ever restrained, almost entirely left her, and within seven days more was gone. I therefore, unsolicited by you, feel I ought to state the case for the good of society at large.

(Signed) ——, M.D.Edin.

Sanaphos

T. M. Reg.

For all Disorders of Nutrition and Nerves

NUTRITION needed for nerves in Neurasthenia and Nervous Debility in these nerve-wearing and distracting times is amply supplied by SANAPHOS, which is not a one-constituent food but is replete in tissue-repairing and energy-giving constituents.

These are supported by the phospho-nucleins and other organic phosphorus compounds, enzymes, and vitamin, which ensure assimilation and repair, restoring to the organism, tone, nerve fitness, and vigour.

SANAPHOS has an attractive milk-like flavour and is soluble. Patients take it readily, and it has given most valuable results in all debilitated conditions, restlessness, insomnia, and helps in a very striking way in bringing those weakened by illness back to strength.

SANAPHOS is and always has been wholly British.

SANAPHOS is procurable at fixed prices from all Chemists and Stores throughout the world.

For all information address—

BRITISH MILK PRODUCTS CO., LTD.

"YADIL" ANTISEPTIC

(Tri-methenal allylic carbide compound) in the treatment of

TUBERCULOSIS.

Much correspondence in connection with the use of "YADIL" Antiseptic has reached us, dealing with satisfactory results obtained after a comparatively short period in the treatment of pulmonary tuberculosis. Numbers of cases, several of which were in advanced stages, have been treated with internal doses of 60 minims three times daily in milk, and although in the majority of cases it has been in use for a few weeks only, reports of a decidedly encouraging nature are coming to hand.

We do not suggest that "YADIL" Antiseptic is a cure for Tuberculosis. It has been in use for too short a period to make such a claim. But we can definitely state, from data to hand, that results have included cessation of purulent sputum, lowering of temperature, renewed appetite, and increase in weight and vitality, and elimination of depression.

The ravages caused by Tuberculosis will induce all interested in the problem of checking the spread of this disease to seriously consider any form of treatment which offers a promise of success.

We would suggest that in view of the results obtained with "YADIL" Antiseptic, a thorough clinical test should be carried out under medical supervision in establishments dealing with Tuberculosis in various parts of the country, and that a record of the cases and conditions, as well as dosage employed, should be carefully kept, from which the best technique can be arrived at by comparison. This would be of inestimable value to the medical profession.

We are firmly convinced that in "YADIL" Antiseptic a powerful weapon for fighting Tuberculosis has been placed in the hands of the medical profession, and that the above suggestion will strongly appeal to medical men interested in the progress of science.

A very efficient test of the power of "YADIL" can be carried out at under a cost of 20/-, and in view of the fact that treatment can, if necessary, be carried on in the patient's home, this will tend to economy.

"Yadil" Antiseptic as a Prophylactic.

Prophylaxis in cases of other infections of the nature of rubeola, scarlet fever, &c., has been directly established by the use of "YADIL" Antiseptic, and in cases of infection in schools and congregated areas, epidemics can be checked by means of prompt dosage of all in contact with the primary cases.

No Free Samples.—The success of "YADIL" has been established in Hospital and Medical Practice. Owing to scarcity of supplies, we regret being unable to distribute free samples.

A Physician to the Red Cross writes:

"I use Sanatogen very largely in my Consulting Practice, and find it invaluable for my soldier patients suffering from shell shock, debility, &c."

Extract from a Report by the Principal Medical Officer of the Officers' Training Corps, Aldershot:

"Tonsillitis.—This painful affection was in former years a source of much trouble. ..... Experiments which I made convinced me that in Formamint I had a powerful prophylactic. I therefore had a memo. circulated among O.C. Detachments recommending its general use, and the result has far more than justified my anticipation. ..... As a proof of the value of Formamint, I may mention that although Tonsillitis was very prevalent in Aldershot this year we had only a few mild cases instead of the numerous cases in former years."

The Genuine Original

SANATOGEN & FORMAMINT

ARE NOW ABSOLUTELY BRITISH.

GENATOSAN, LTD. (British Purchasers of the Sanatogen Co.),

Chairman: Lady Mackworth,

12, CHENIES STREET, LONDON, W.C. 1.

NOTE.—*Both Sanatogen and Formamint will later on be re-named to distinguish them from so-called substitutes.*

Science Offers You Her Latest Triumph

THE manufacture of synthetic organic drugs by skilled chemists enables the general practitioner interested in the scientific aspects of medicine to keep fully abreast of recent medical practice. In addition to being able to supply immediately all the new antiseptics investigated by Dakin and his colleagues in their remarkable researches, BOOTS PURE DRUG COMPANY LIMITED have pleasure in announcing the issue of a valuable new antiseptic preparation which they have recently perfected—

CHLORAMINE-T CREAM

Containing approximately 1 per cent. Chloramine-T. Described and investigated under the name of Chloramine Paste by Vincent Daufresne, Carrel, Hartmann and others, in the Journal of Experimental Medicine, 1917.

CHLORAMINE-T CREAM cleans and sterilises infected wounds, and maintains an aseptic condition once it is established: it has no retarding effect upon the speed of healing of wounds. CHLORAMINE-T CREAM is invaluable as a *safe and efficient curative toilet cream, and as a first dressing which may be relied upon to disinfect with certainty* wounds, cuts, and abrasions, whether light or severe, and in all similar cases of emergency.

IN POTS. TRIAL SIZE 9d. LARGE SIZE 2/6.

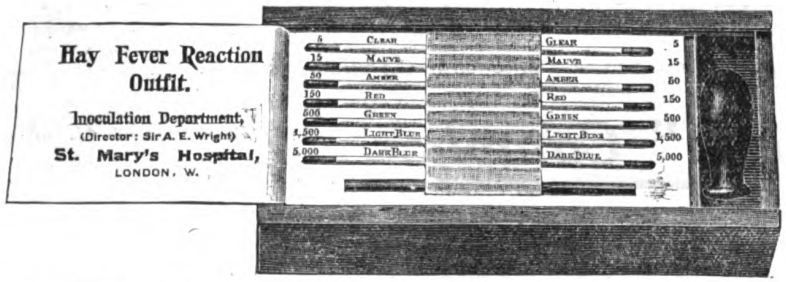
Immunisation against Hay Fever

THE DEPARTMENT FOR THERAPEUTIC INOCULATION, ST. MARY'S HOSPITAL, LONDON, W., prepares for supply to the Medical Profession, through the agency of Messrs. Parke, Davis & Co.,

"POLLACCINE"

(Pollen Vaccine for Hay Fever)

to be administered subcutaneously for the production of immunity to pollen toxin, both as a prophylactic and curative of hay fever.



A Hay Fever Reaction Outfit

is also supplied, which affords a means of determining

(a) whether a patient is susceptible to pollen toxin.

(b) the degree of such susceptibility.

(c) the dosage of "Pollaccine" suited to any case.

N.B. In very severe cases, prophylactic treatment should be commenced in the early winter; in milder ones, later in the winter or even in spring may suffice.

Further particulars will be supplied on request by

PARKE, DAVIS & CO., LONDON, W.

Telegraphic and Cable Address: "Cascara, London." Telephone: Regent 3260 (six lines).

Advances in Treatment

We make a speciality of the preparation of solutions for hypodermic injection. The following are selected from our complete list, which covers most of the formulæ in use, and will be sent on application.

"Azoule" "Pituitarin."

Trade Marks

½ c.c. "Azoule," 4/6 per dozen.
1 c.c. "Azoule," 8/- per dozen.

A highly active physiologically tested and standardised solution of infundibular pituitary substance.

"Azoule" "Alopon."

Trade Marks

⅓ grain "Azoule," 3/- per dozen.
"Azoule" "Alopon"-Atropine, 3/- per dozen. "Azoule" "Alopon"-Scopolamine 4/- per doz.

A solution of the hydrochlorides of the mixed alkaloids of opium used as a sedative and analgesic.

"Azoule" Emetine.

Trade Mark

⅓ grain "Azoule," 5/- per dozen.
½ grain "Azoule," 7/- per dozen.
1 grain "Azoule," 12/- per dozen.

For use in the treatment of Amœbic Dysentery.

"Azoule" Quinine Bihydrochloride.

Trade Mark

5 grain "Azoule," 5/- per dozen. 7½ grain "Azoule," 6/- per dozen.
10 grain "Azoule," 7/- per dozen.

For intramuscular injection in the treatment of malaria.

"Azoule" Camphor.

Trade Mark

1½ grain "Azoule," 3/- per dozen.
3 grain "Azoule," 4/- per dozen.

A diffusible stimulant and restorative of great value in collapse following acute fevers and in acute pneumonia.

Use the distinctive word "Azoule" to signify sterile glass capsules of Allen & Hanburys' manufacture.

Allen & Hanburys Ltd., London.

The "Allenburys" (Trade Mark) Cod-Liver Oil and its Preparations.

"It is as nearly tasteless as Cod-Liver Oil can be."—LANCET.

The "Allenburys" Cod-Liver Oil is obtained from the **finest** selected livers of fresh cod, and prepared at Allen & Hanburys' own factories at Lofoten and Söndmör, in Norway. It is the **result of** manufacturing experience of nearly half a century, and **represents** the highest technical skill. The process of manufacture **ensures the** elimination of all unpleasant and harmful products. The "Allenburys" Cod-Liver Oil is therefore perfectly pure, and by its merit alone **has** obtained a unique position in the estimation of the profession. **It is** retained and assimilated when other Cod-Liver Oils derange **the digestive system, and its full nutritive** power is thereby **assured.**

"Bynol" (Trade Mark)

"A perfect combination of Malt Extract and Cod-Liver Oil."—B.M.J.

"Bynol," the "Allenburys" Malt and Oil, presents **the** pure "Allenburys" Cod-Liver Oil in intimate association with **the finest** Malt Extract. It contains **a** very high percentage of **Cod-Liver Oil** and is a valuable nutrient and digestive. Palatable and **acceptable** to the most fastidious, it **is readily assimilated even when the digestive** organs are impaired.

"Bynin" Emulsion (Trade Mark)

"This preparation is doubtless a valuable one, and one which we are glad to bring before the notice of the profession."—LANCET.

"Bynin" Emulsion is a unique combination of the **"Allenburys"** Cod-Liver Oil with "Bynin" pure active liquid malt, **together with** the hypophosphites of lime and soda. Palatable and easily **digested, it** is a valuable restorative of high nutritive power. It **invigorates the** nervous system and nourishes the enfeebled tissues.

LIQ. SANTAL FLAV. c. BUCHU ET CUBEBÂ (HEWLETT'S)

Originally introduced by us in 1877, and has become a standard remedy all over the world in the treatment of CHRONIC DISEASES of the URETHRA, &c.

THE LANCET wrote, December 8th, 1877:—

"A safe and valuable remedy. It mixes perfectly with water, and, as it can be taken with ease, it is sure, we think, to come into common use."

THE BRITISH MEDICAL JOURNAL wrote, December 15th, 1877:—

"Messrs. C. J. Hewlett & Son have forwarded to us a 'Liquor Santal Flav. cum Buchu et Cubebâ'; it is readily miscible with water, and when administered proves to contain all the medicinal virtues rightly attributed to these drugs."

DOSE: One to two drachms in water or milk.

Price, in England ... 11s. lb.

To ensure obtaining the Original Preparation, please write "LIQ. SANTAL FLAV. c. BUCHU et CUBEBÂ (HEWLETT'S)," or the title may be conveniently abbreviated to "Liquor Santal Co. (HEWLETT'S)."

IODERMIOL BOUGIES AND PESSARIES.

IODERMIOL is a bland emollient, non-irritating and non-staining preparation of Iodine, superior to the official tincture or ointment in strength. It is perfectly miscible with oils, and a 10% solution in Almond Oil has been successfully employed in injections.

IODERMIOL BOUGIES contain 25% Iodermiol, and are approximately equal in strength to the B.P. tincture of iodine, without the disadvantages of that preparation. They have been used with great success in various stages of the disease.

Price ... ... 2s. 6d. per dozen.

IODERMIOL PESSARIES also contain 25% Iodermiol and have been found useful in inflammatory conditions of the Uterine organs.

Price ... ... 3s. 6d. per dozen.

TABLETS POT. IODID. et HYDRARG. PERCHLOR.—These tablets have been made for several years and proved very successful. They contain 5 grains Potass. Iodid. and $\frac{1}{16}$ gr. Hydrarg. Perchlor.

In bottles of 100 ... ... 30s. per doz.

SAMPLES and LITERATURE SENT (ONLY) to MEDICAL MEN on REQUEST.

Obtainable from all Dispensing Chemists, or direct from—

COMBATS SERIES, 175—SIAMESE

Uniformly successful treatment of Infantile Malnutrition

Clinical reports continue to confirm the value of Humanised Milk as prepared with

'KEPLER' Malt Extract

(Trade Mark)

The physician of a hospital in New Zealand reports that many young mothers of infants suffering from malnutrition have come long distances to obtain this recipe from him, and now they recommend others to do likewise.

Babies suffering from malnutrition rapidly regain their normal weight and afterwards make steady weekly progress.

The ancient Siamese had been vassals of Cambodia for about six hundred years, when, led by their renowned King Pra Ruang, they determined to throw off the yoke. After ten years' hard fighting, during which the very appearance of the Siamese was sufficient to inspire the Cambodians with terror, they secured their freedom. The figure here reproduced from a manuscript is that of an ancient Siamese warrior, wearing a demon's mask and fighting with bow and arrow. A Siamese inscription of the period declares that "the inhabitants of the Thai (Siamese) country have not their equals in intelligence, in ruse, in courage, in audacity, in strength. They have vanquished the crowd of their enemies. They have a great kingdom and many elephants." After their conquest they gave themselves up to agriculture. Date, circa A.D. 1296.

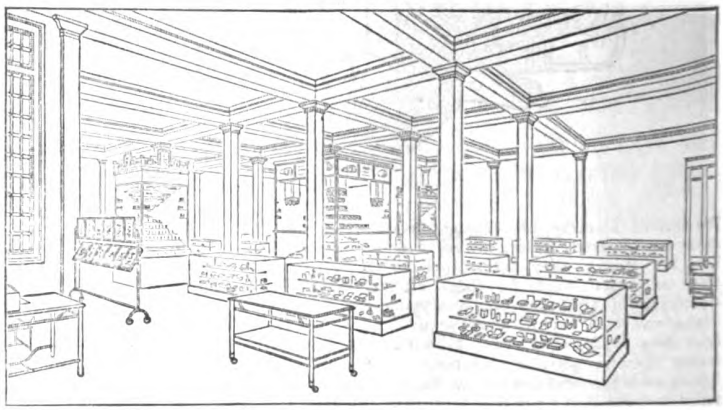
'TABLOID' BRAND MEDICAL OUTFITS

SERVICEABLE GIFTS
for presentation at Xmas and the New Year

Why not present relatives and friends with a 'Tabloid' Outfit? Most appropriate, elegant and useful.



There are Outfits suitable for R.A.M.C. Officers and for physicians at home. Special Outfits are also issued for Combatant Officers and Men. These Outfits would prove of priceless value in many a conceivable emergency.

AN INTERESTING EXHIBITION

Physicians are invited to inspect the display of Burroughs Wellcome & Co.'s Outfits and products at the Firm's

London Exhibition Room: 54, Wigmore Street, W.

Representatives are there to give information and demonstrations without any suggestion to purchase.

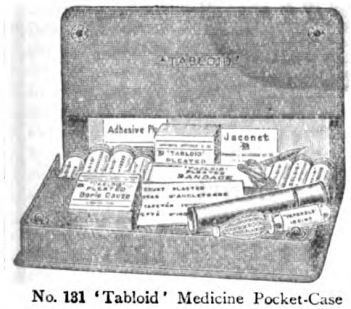
New Year's Day



No. 117 'Tabloid' Medicine Pocket-Case

No. 117 'Tabloid' Medicine Pocket-Case

Measurements: 7½ × 4½ × 2⅝ in.

Ideal for physicians and R.A.M.C. Officers. An extensive range of 'Tabloid' medicaments for emergency dispensing can be carried. Invaluable in country practice. Supplied in elegant leathers, *e.g.*, cowhide, pigskin, morocco, seal and crocodile.

Price in London, from **37/0**

No. 131 'Tabloid' Medicine Pocket-Case

No. 131 'Tabloid' Medicine Pocket-Case (Book-form)

Measurements:
6 × 3½ × 1⅜ in.

Specially made and fitted for the use of Combatant Officers and Men. Contains a judicious selection of emergency medicaments, dressings, etc. An excellent example of the "multum in parvo" arrangement effected by B. W. & Co. Made for hard wear in the firing-line.

Price in London, from **13/6**

No. 134 'Tabloid' Medicine Pocket-Case

Measurements: 6½ × 4½ × 1⅜ in.

A useful Outfit for physicians who are accustomed to carry a selection of 'Tabloid' emergency medicaments. The case is strongly made in various choice leathers, *e.g.*, cowhide, pigskin, seal, morocco and crocodile.

Price in London, from **27/0**

No. 134 'Tabloid' Medicine Pocket-Case

If desired, the contents of any outfit can be varied to order and will be charged accordingly. Outfits obtainable through all Chemists. See also Wellcome's Medical Diary.

Pneumonia—
Prognosis—

Osler regards a slight or complete absence of leucocytosis as a very unfavourable sign in pneumonia.

Heart weakness due to the specific action of the poison, to the prolonged fever, or to the over-extension of the right chambers is the important prognostic feature of the disease.

Antiphlogistine

increases leucocytosis; it relieves the heart by increasing the capillary circulation, it hastens the elimination of toxins, reduces the fever, and relieves the dyspnœa and cyanosis. The use of Antiphlogistine in pneumonia is a most rational procedure; it is logical, it is reasonable, and it is scientific.

Hunterian Lecture

ON THE

SURGICAL COMPLICATIONS OF TYPHOID AND PARATYPHOID FEVERS.*

Delivered before the Royal College of Surgeons of England on March 5th, 1917,

BY A. E. WEBB-JOHNSON, M.B., CH.B. MANCH., F.R.C.S. ENG., D.S.O.,

LIEUTENANT-COLONEL, R.A.M.C. (T.C.); HUNTERIAN PROFESSOR OF SURGERY; ASSISTANT SURGEON TO THE MIDDLESEX HOSPITAL.

MR. PRESIDENT, LADIES, AND GENTLEMEN,—When I informed the Army medical authorities that you had done me the honour of electing me Hunterian professor, and that the subject of my lecture was to be the Surgical Complications of Typhoid and Paratyphoid Fevers, I was asked to deal with the subject fully and to make as detailed and as comprehensive a review as possible of our experience at No. —— Stationary Hospital, the principal British hospital in France for the treatment of these fevers. I have completed this task and propose to publish the review in full, but in this theatre I thought it would be more suitable and appropriate if I confined my lecture to a general discussion of the subject and only attempted to give a detailed account of those complications which are of special surgical interest or have an important relation to the many problems associated with the typhoid group of fevers.

HISTORICAL OUTLINE.

An inquiry into the early records of typhoid fever in this country opens some interesting pages of English history. In war we first find evidence of the disease in 1643, when the ranks of the Parliamentary forces were thinned by an outbreak of infection, from which King Charles's followers also suffered and which they carried with them to the Royalist stronghold at Oxford. Here Thomas Willis was serving the King in the University Legion, and from the detailed account which he gave of this epidemic in his classical work, "De Febribus," there is no doubt that the disease was typhoid fever. This is the same Willis whose name is so familiar to us from the anastomosis of the main cerebral arteries at the base of the brain being named after him.

Since the time of this, its first known appearance in war, typhoid fever has been a menace to armies in all campaigns of any duration and has often cost the British Army dear. In peace as well as in war, however, we have suffered as a nation from the ravages of this disease, which has attacked members of our Royal House on more than one occasion. The very first case which allows of clear demonstration was that of Henry, Prince of Wales, eldest son of King James I., who died in 1612 of a fever epidemic at that time. For the careful description of the illness and the post-mortem appearances, which enabled Dr. Norman Moore to identify the disease as typhoid fever, we are indebted to that distinguished French physician, Sir Theodore de Mayerne, who was in attendance on the Prince during the last part of his illness.

Passing to a time within the memory of some of us we find typhoid fever making us mourn the loss of Prince Albert in 1861, while King Edward, when Prince of Wales, was brought to the brink of the grave by an attack of the same disease ten years later. Among the physicians in attendance on these Royal patients was Sir William Jenner, whose work at the London Fever Hospital from 1847 to 1851 did so much to help in the differentiation of the continued fevers. In 1862 Dr. Charles Murchison, who was then on the staff of the Middlesex Hospital and, like William Jenner, on that of the London Fever Hospital, published his classical work, "The Continued Fevers of Great Britain," which became at once a standard authority and still maintains a prominent place in the literature of the subject. The third edition was edited by another physician to the Middlesex and the London Fever Hospitals, a great authority on these fevers who died only last year, Dr. William Cayley.

* The lecture was illustrated with numerous lantern slides.

Morbid Anatomy and Bacteriology.

The characteristics of the continued fevers generally and of typhoid fever in particular became well recognised owing to careful clinical study and the methodical investigation of morbid anatomy, to which work it would be surprising indeed if we did not find some contribution from John Hunter. Reference to the Hunterian manuscripts shows that Hunter in the course of his "Dissections of Morbid Bodies" gave close attention to the morbid anatomy of this disease, and in the Museum of this College are 13 specimens of the intestinal lesions from Hunter's original collection.

After Hunter, Paget. He was amongst the first to realise the large and interesting field for surgical investigation in the complications and sequelæ of the continued fevers. The first surgeon to give this subject the careful study which Paget saw it deserved was William Keen, of Philadelphia, who discussed it in his Toner lecture of 1876, and whose well-known work, "The Surgical Complications and Sequels of Typhoid Fever," was published in 1898. Between the two dates an epoch-marking discovery was made when in 1880 Eberth demonstrated the *Bacillus typhosus*. During the next decade, with the discovery of other closely allied organisms such as the *Bacillus coli communis*, the bacilli of meat poisoning and others, it became evident that there existed a group of bacilli which were practically identical with the *Bacillus typhosus* morphologically, but which differed in their cultural reactions and pathogenetic properties. A new chapter in the history of the typhoid problem was opened by the discovery of organisms which closely resembled the *Bacillus typhosus*, produced identical symptoms and post-mortem appearances, and yet were distinguishable from it. In 1896 Achard and Bensaude isolated organisms, which they called paratyphoid bacilli, from two patients with typhoid-like fever. In 1898 Gwyn cultivated a similar bacillus from the blood of a patient with symptoms of typhoid fever, and in 1901 Schottmüller described five cases of what was apparently typhoid fever, and in which he had found two species of paratyphoid bacilli. These organisms were named the *Bacillus paratyphosus A* and the *Bacillus paratyphosus B*, forming with the *Bacillus typhosus* a sub-group of the large coli-typhoid group of organisms.

It has been established that the bacilli of the typhoid sub-group are distinct specific micro-organisms, and the diseases to which they give rise are known as typhoid fever, paratyphoid A, and paratyphoid B. In the words of Sir Bertrand Dawson[1]:—

"Looked at broadly, paratyphoid is typhoid fever in miniature. A patient invaded by it stands to be ill less severely and for a shorter time, is less prone to complications, and, *a priori*, less likely to die. It presents a clinical picture which is suggestive, though not absolutely distinctive, and its certain diagnosis from typhoid can only be made with the aid of bacteriological findings," but, "though habitually milder, paratyphoid may present the gravity of severe typhoid."

Paratyphoid A is a milder disease than paratyphoid B, which is the form of paratyphoid fever usually encountered in the Western hemisphere.

DIAGNOSIS: BLOOD PICTURE.

For my analysis of the surgical complications of these fevers I have studied the cases admitted to No. —— Stationary Hospital during the first two years of its existence as an isolation hospital, and have used the 2500 which have been diagnosed definitely as either typhoid, paratyphoid A, or paratyphoid B.

TABLE I.

Disease.	Number of cases.	Deaths.	Mortality, per cent.
Typhoid, inoculated	821 } 1118	27 } 84	3·28 } 7·51
,, not inoculated	297 }	57 }	19·19 }
Paratyphoid A, inoculated ...	123 } 344	0 } 1	0 } 0·29
,, not inoculated...	221 }	1 }	0·45 }
Paratyphoid B, inoculated ...	239 } 1038	1* } 18	0·41 } 1·68
,, not inoculated...	799 }	17 }	2·12 }
Totals	2500	103	4·12

* This patient had lympho-sarcoma.

In many cases, especially in the inoculated, it has not been possible to isolate the infecting bacillus, and we have been dependent for the confirmation and establishment of

the diagnosis on examinations of the patient's serum and the determination of its agglutinating power on the different organisms of the typhoid group. The fact that agglutinins are produced in response to preventive inoculation makes it more difficult to determine whether an inoculated individual is suffering from a typhoid group infection, and, if so, to which organism the infection is due. By means of Dreyer's delicate technique the difficulties of diagnosis have been overcome. The amount of any specific agglutinins present in a patient's serum can be determined with accuracy, and, with few exceptions, by repeated measurement and study of the variations in the agglutinating power of a patient's serum it can be shown what organisms of the typhoid group, if any, are the cause of his illness.

Before discussing the surgical complications a word about the blood picture associated with these infections. As in tuberculosis and influenza and other diseases caused by bacilli, the reaction of the cellular elements of the blood to infection by typhoid or paratyphoid bacilli consists of an increase in the number of lymphocytes at the expense of the polymorphonuclear cells. This change is progressive, and owing to the diminution in the number of polymorphs an actual leucopenia may be produced. When surgical complications supervene this leucopenia is replaced by a leucocytosis with an increase in relative and absolute number of the polymorphonuclear leucocytes, but the number of these cells and the degree of leucocytosis are not so high as are met with in surgical conditions not associated with a bacillary infection.

INTESTINAL HÆMORRHAGE.

Table II. shows the incidence of intestinal hæmorrhage. It demonstrates, like Table I., the greater severity of typhoid as compared with paratyphoid fever, and shows that paratyphoid B is a more severe disease than paratyphoid A. It

TABLE II.—*Intestinal Hæmorrhage.*

,, not inoculated...	799	15	1·87	4
Totals	2500	67	2·68	30

also illustrates a point to which I will return—the remarkable effect of inoculation in diminishing the severity of the illness. Though it has been suggested that hæmorrhage from an intestinal ulcer might be dealt with by operation, this course can seldom be practicable. The surgical interest of intestinal hæmorrhage lies rather in its relation to other complications which are essentially surgical in their nature and treatment.

INTESTINAL PERFORATION.

Perforation of the intestine is one of the most formidable and most urgent of the surgical complications of these fevers. The usual frequency in typhoid is once in about every 30 to 40 cases and since it is commoner in males of between 20 and 30 years of age, it will be seen that in the present series (Table III.) the incidence has been small.

TABLE III.—*Intestinal Perforation.*

Disease.	Number of cases.	Cases of perforation.	Percentage.	Cases of operation.	Recovered.	Died.	Day of disease on which perforated.

While in ambulatory cases perforation may be the first sign of illness it occurs most frequently in the third week. It has been reported as early as the eighth and as late as the 110th day. In the present series 8 out of 14 cases occurred during the fourth and fifth weeks, while one was as early as the twelfth, and another as late as the seventieth day.

As a rule, there are about five cases of ileal perforation to one in the rest of the intestinal tract, but in this series (Table IV.) the proportion of ileal perforations was by no

TABLE IV.—*Site of Intestinal Perforation.*

* In one of the ileal cases there were three perforations.
† In this case there were two perforations.

means so great. In paratyphoid fever the large intestine is involved to a greater extent and is more severely affected than is usual in typhoid and in three out of five cases of perforation in paratyphoid the opening was in the large bowel.

Perforation occurs, as a rule, when the sloughs are separating. The opening is nearly always small and will often only admit a pin. In some cases a cribriform opening is found. Sometimes the peritoneal coat is included in the slough when the perforation is large and generally round or oval.

It is important to be specially on the look-out for symptoms of perforation in severe cases during and after the second week, and particularly in those who have marked tympanites or diarrhœa or have suffered from intestinal hæmorrhage.

Table V. shows the relation of perforation to hæmorrhage in the present series of cases, and it will be seen that nearly a third of the cases of perforation had also suffered from hæmorrhage.

Totals	2500	67	14	4

Diagnosis and Treatment of Perforation.

The diagnosis of perforation may be extremely difficult. In obvious cases which are rare there may be all or most of the symptoms and signs of an acute abdominal lesion, but with the usual small perforation in a patient whose sensations are blunted by toxæmia symptoms may be slight or even absent, and perforation has been found at post-mortem examination when the condition was unsuspected during life. On this occasion I will not go any further into the question of diagnosis than to say that it is important for every aid to be enlisted in cases of doubt, and a blood count may be of great use especially if repeated observations have been made previously, for then smaller changes will be appreciated. Also, since early diagnosis and treatment are essential to success, it is imperative that the surgeon should have the opportunity of seeing the patient when there is the slightest suspicion of perforation having occurred. It is no use waiting until symptoms are well established, for then it may be too late and the case past hope.

"Delays have dangerous ends"—so much so that in a doubtful case the abdomen should be explored. No harm is likely to be done and life may be saved. It is far better to open the abdomen and find no perforation than for a post-mortem examination to reveal one which could have been closed, perhaps with success.

The usual result of perforation if left alone is general peritonitis, but in very rare instances we find evidence of localisation of the infection or protective plastic peritonitis preventing leakage of intestinal contents. Two of our cases showed signs of an attempt by nature to prevent or limit

nfection of the peritoneum. One of them had intestinal obstruction, the possibility of which must be remembered, and a peritoneal band was found obstructing the ileum. The starting-point of the band was a small perforation in the ast part of the ileum, to which the omentum had become adherent. One of Hunter's specimens shows this rare condition; there is a deep ulcer which is evidently about to perforate, but the base is protected by peritoneal adhesions.

These instances support the view that perforation may take place and the patient recover without operation, but they are of such exceptional occurrence that they do not warrant any departure from the universally accepted necessity for immediate laparotomy when a diagnosis of perforation is made.

Some Points in Technique.

While a detailed discussion of technique would be out of place on an occasion like this there are a few points to which I should like to call attention. Operation may be performed under local anæsthesia alone, but a combination of local or spinal analgesia with small doses of ether inhalation is preferable. A word with regard to the incision. An incision through the right rectus is favoured by some surgeons, but though an incision on the right side may be convenient for dealing with a perforation in the usual site—the last portion of the ileum near the cæcum—it may be extremely inconvenient in the case of perforation of the colon. As we have seen, the large intestine is more likely to be the seat of perforation in paratyphoid fever, so that in this disease, at any rate, and probably as a general rule, a mid-line incision will prove the most suitable. As a rule, the perforation is easily found. In nearly 90 per cent. of the cases it is single, but a search should be made for other openings, which, if present, are nearly always in an adjacent coil of intestine.

When the perforation is found it should be closed, as a rule, but if there is intestinal atony, or paresis, or symptoms of pseudo-ileus, it is a wise procedure to perform an enterostomy. The value of intestinal drainage in this condition has been emphasised in recent years. Good results have followed simple drainage of the peritoneal cavity when conditions were desperate and suture of the intestine out of the question.

In the present series the results have been disappointing. The patients were in an extremely critical condition, and operation was undertaken rather as a *dernier ressort* than with much expectation of success. A special factor which weighed against the patients in this series was the high percentage of cases in which the large intestine was the seat of perforation. The greater degree of sepsis in the large bowel would affect the mortality in perforation, as in other surgical conditions of this part of the intestine.

THE SPLEEN.

The spleen forms a prominent feature of the clinical picture and plays an important part in the pathology of the typhoid group of infections, but this viscus is seldom the seat of surgical complications, though focal necrosis is frequently found in fatal cases. That rare accident, spontaneous rupture of the spleen, has occasionally been observed in typhoid without any coexistent or previous malarial infection. Splenic abscess is a rare complication of typhoid and paratyphoid and is practically always, if not always, the result of infarction. In the present series there were three cases of splenic abscess. One occurred in typhoid and two in paratyphoid B. All the cases were fatal and the specific organisms were obtained from the pus in each case.

The greatest surgical interest of the spleen in these fevers is its relation to infection of the biliary passages and the persistence of bacilli in the body, to which I will return when dealing with the carrier problem.

THE LIVER.

The liver also performs important functions in fighting these infections and in fatal cases shows, as a rule, focal necrosis and parenchymatous degeneration, but abscess in this organ is extremely rare. Abscess may arise from a septic infection of the bile passages or infective emboli may reach the liver through the hepatic artery or portal vein. When the infection is carried by the hepatic artery the liver abscess is part of a systemic pyæmia with abscesses in other parts of the body. When the portal vein is the channel of infection there is generally a gangrenous inflammation of some part of the intestinal tract (nearly always the appendix) with thrombosis of the veins in the neighbourhood. Abscesses of the liver in these fevers may be multiple or single. If single, drainage may be provided and the outlook is not bad. In our experience there were two cases of liver abscess; both occurred in paratyphoid B. In one a fatal pylephlebitis followed an abscess round a gangrenous appendix; the pus yielded a pure culture of *Bacillus typhosus B.* In the other case the abscess ruptured into a bronchus and the pus was expectorated. Diplococci and short-chain streptococci were recovered from the pus. The patient did well and eventually returned to duty.

THE GALL-BLADDER.

The elimination of micro-organisms by the liver from the portal circulation and the excretion with the bile of those which are not destroyed goes on constantly during the course of these fevers. In fatal cases pure cultures of typhoid and paratyphoid bacilli are obtained from the contents of the gall-bladder with more certainty than almost any part of the body except the spleen and the bone-marrow. The bacilli may be found in the biliary tract without the patient ever having had symptoms of typhoid or paratyphoid fever, while an acute cholecystitis may be the sole manifestation of a typhoid group infection.

The gall-bladder may also be infected through its arterial blood-supply or by ascending infection from the intestine, but the constant excretion of the bacilli in the bile in the course of these fevers is a possible mode of infection even long after they have disappeared from the systemic circulation. As a rule the passage of these micro-organisms along the biliary tract gives rise to no symptoms or signs of inflammatory reaction, but definite cholecystitis occurs occasionally in the course of these fevers and may be associated with ulceration or even lead to perforation of the gall-bladder.

In such cases there is some question whether the infection carried by the bile leads to the ulceration, or whether the gall-bladder wall is infected by the blood stream and the ulceration is secondary. Probably the condition arises as the result of both methods of invasion.

Though a mild cholecystitis presumably occurs in a fair percentage of cases it is only possible to diagnose the condition with any degree of certainty in a few. In the present series there were 15 cases with more or less definite symptoms of cholecystitis. In only one case was surgical intervention necessary, and, curiously enough, the patient was one of the 14 women of the series.

In the third week of an attack of paratyphoid B the patient, aged 29, developed symptoms of acute cholecystitis. As symptoms persisted operation was decided on, and in the tenth week cholecystectomy was performed, the patient making a good recovery.

The gall-bladder was not enlarged. It contained turbid bile-stained fluid and there was a gall-stone the size of a nutmeg in the neck of the viscus. The omentum was adherent to the fundus, and in the wall nearest the liver was a diffuse infiltration round an abscess which communicated by a small opening in the mucous membrane with the cavity of the gall bladder. The mucous membrane was acutely inflamed with many petechial hæmorrhages under its surface. The *Bacillus paratyphosus B* was obtained in pure culture from the contents of the gall-bladder and from the abscess in its wall.

The stone was a practically pure cholesterin calculus, but was not examined bacteriologically until later when no micro-organisms were found. Possibly it was present before the attack, and may have been the predisposing cause of the cholecystitis, for though the patient had never had any symptoms referred to the gall-bladder before the third week of her attack of paratyphoid, she had suffered from appendicitic abscess three and a half years previously and may have had some infection of the biliary tract then.

We have evidence, however, that gall-stones may form rapidly and within the 60 to 70 days which elapsed in this case, between the time of onset of the paratyphoid and the time when operation was performed.

In Mignot's[2] experiments the formation of two cholesterin gall-stones in a dog took between 5 and 6 months. Hurst and Adams,[3] however, reported the case of a woman, aged 24, from whom 25 faceted cholesterin gall-stones were removed 70 days after the onset of typhoid fever. The *Bacillus typhosus* was obtained in pure culture from the contents of the gall-bladder and from the centre of some of the stones.

The treatment of typhoid cholecystitis is expectant, and surgical intervention is only called for if the symptoms and

signs do not subside or if there is evidence of gall-stone formation. Urotropine has been shown to be a valuable antiseptic for the biliary as well as for the urinary tract, and may be given in doses of as much as 20 grains three times a day. This drug may prove useful in preventing gall-bladder complications and is prescribed with advantage during typhoid and paratyphoid fever.

The main surgical interest in typhoid group infection of the gall-bladder is the occurrence of a mild catarrh which favours the production of gall-stones. Moreover, the infection may persist in the biliary tract for years after an attack of typhoid fever, and the *Bacillus typhosus* has been isolated from the contents of the gall-bladder when operating for gall-stones many years after recovery from the disease. The infection may also persist and linger in the biliary tract, apparently without causing any inflammatory reaction—a point to which I will return when discussing the carrier problem.

CARDIO-VASCULAR SYSTEM.

Of the cardio-vascular system I will say little. The subject of venous thrombosis, the commonest of the surgical complications in the circulatory system, was very fully dealt with in this theatre in Hunterian lectures delivered by Mr. Warrington Haward in 1906. In the present series we had the usual number of cases. (Table VI.) There was also

TABLE VI.—*Venous Thrombosis.*

the usual preponderance of cases affecting the left side. Keen was convinced that this preponderance was to be explained by the compression of the left common iliac vein where it passes under the right common iliac artery, and Mr. Warrington Haward showed, in addition, that the vein is also crossed by the left internal iliac artery, and that common and internal arteries cross almost at right angles in marked contrast to the relations on the other side.

I have one new point to bring to your notice in the treatment of thrombosis. Citrates are generally recommended, and Captain H. F. Marris has had many remarkably successful results by intravenous administration. He gives 10 ounces of a 0·5 per cent. solution of sodium citrate in saline, and repeats the dose if necessary at intervals of a few days. The dose seems very small, and at present the cases are too few to permit of any definite statement as to the advantages of this method of treatment, but some of the results have been very striking.

THE GENITO-URINARY SYSTEM.

Let us pass now to another excretory channel by which the bacilli of the typhoid group leave the body. In a large number of cases the bacilli are found in the urine at some

TABLE VII.—*Genito-Urinary Complications.*

period of the disease, generally about the third week or later, or sometimes not until convalescence. In typhoid they are found in about a quarter of the cases, but in paratyphoid the proportion is less, and in inoculated individuals it is smaller still. When bacilluria is present in the course of these fevers there may be no signs of inflammatory reaction in any part of the urinary tract, but in a certain number of cases there is some pyuria, though this often only amounts to the detection of a few pus cells in the urine.

The cases of urinary disease included in Table VII comprise only those in which there were signs and symptoms directing attention definitely to some part of the urinary tract. In all these cases the specific infecting organisms were present in the urine.

Pyelitis and Cystitis.

Pyelitis and cystitis were diagnosed in 16 cases. The time of infection is generally about the third week, or later, and of the 16 cases 10 began after the third week. Cystitis usually followed an obvious pyelitis, and seemed to be due to a descending infection of the urinary tract. The *Bacillus paratyphosus B* proved more virulent than the other organisms of the group. There were not only more cases in paratyphoid B, but they were more acute and extensive. In one case of paratyphoid B the main stress of the illness fell on the urinary tract, starting with a very acute pyelitis, with some hæmaturia, followed by cystitis, and eventually a suppurating epididymo-orchitis occurred. Pure cultures of *Bacillus paratyphosus B* were obtained from the urine, and also from the pus from the abscess of the testis.

Typhoid and paratyphoid pyelitis and cystitis, as a rule, yield readily to treatment with urinary antiseptics—especially urotropine. In this series no case required local treatment. The excretion of typhoid-group bacilli may persist, however, for some time after the patient gets about, and to this point I will return when discussing the carrier problem, but there is another point which concerns surgeons more particularly, and that is, what influence this bacillary excretion may have in the etiology of surgical disease of the kidney. Micro-organisms pass through the kidneys in a large number of infectious fevers of every degree and severity, from the most acute like influenza to the most chronic like tuberculosis. The permeability of the kidney tissue is increased and albuminuria is common.

Bacilluria and slight pyuria are certainly commoner than has been generally taught, and since these conditions frequently arise in disease which, in their mildest forms, may easily be classed as more or less minor ailments a history of previous illness assumes an increased importance in the case of disease of the urinary tract. Only by a searching inquiry into the previous history and a routine bacteriological examination of the urine and of any parts of the urinary tract which may be explored at operation can we get a true idea of the part played by these specific bacteria in the etiology of urinary disease. Bacterial excretion may have some bearing on calculous disease of the kidney, for the epithelial débris and coagulable deposits resulting from one of these infections may furnish a nucleus for the deposit of salts which would otherwise have remained in solution in the urine. Davies and Walker Hall[4] have reported a case in which, over five years after an attack of typhoid fever, a woman who was a urinary carrier of *Bacillus typhosus* had her right kidney explored and ten calculi removed. The contents of the renal cavity yielded a pure growth of *Bacillus typhosus B*, and this organism was isolated from the calculi also. It is of great importance to increase our information on this subject, and renal calculi should always be submitted to bacteriological examination.

Epididymo-orchitis.

Epididymo-orchitis is an occasional complication and there were four cases in the present series. All occurred in paratyphoid B and the bacillus was obtained in pure culture from three of them, in which suppuration took place. Owing to the body of the testis being involved, as a rule, either alone or to the same extent as the epididymis, it has been taught that the infection in typhoid and paratyphoid is carried by the blood stream. But the organisms of these diseases give rise to so little infiltration that the infection might extend from the urinary tract to the seminiferous tubules before producing an inflammatory reaction. It is different with organisms like the gonococcus, the pyogenic cocci, and the tubercle bacillus which cause considerable thickening and infiltration along the path of their extension. In the case of tuberculous infection a focus of limitation is brought about first at the globus minor.

In the four cases under review it certainly could not be said that the epididymis was first involved or even markedly affected; in fact, the abscesses were all in the body of the testis. In each of the suppurating cases, however, there had been pyelitis and cystitis, and in the case which did not go on to suppuration there was a marked bacilluria and *Bacillus paratyphosus B* was obtained in pure culture from the urine of all of them. It seems therefore reasonable to conclude that the infection in these cases came from the urinary tract, and I believe that many cases which are attributed to infection from the blood stream can be accounted for in the same way.

PAROTITIS.

Parotitis is another complication which is mainly due to local conditions and not to blood infection. Accumulating evidence goes to show that infection extends to this gland through the parotid duct. No doubt infection may reach the parotid by the blood stream as well as by Stenson's duct, but the great majority of cases, if not all, can be explained satisfactorily by infection along the duct. In the present series there was no case of a pyæmic nature. The subject of secondary parotitis was dealt with very fully by Bucknall,[5] who published a series of convincing cases and showed by microscopic examination in fatal ones that the inflammatory changes were confined in the first place to the ducts, centres of the lobules, and the tissues around, the blood-vessels being primarily unaffected.

In these fevers, besides the lowered vitality of the patient and increased liability to septic infection, there are certain local conditions which predispose to an ascending infection of the duct. Owing to fever and a restricted diet the salivary secretion is diminished in amount. At the same time the mouth-breathing so frequent in fever patients leads to further drying of the mucous membrane. Micro-organisms then become more plentiful and virulent. Moreover, the specific bacteria of the disease have frequently been found in the oral secretions. Too much attention cannot therefore be given to the toilet of the mouth in these fevers. Constipation should be avoided and solid food should be given as soon as it is safe to do so.

Parotitis is a serious complication not only as an indication of the septic condition of the patient, and especially of his mouth, but also in itself as an inflammatory or suppurating focus which is under high tension because of the resistant fascia covering the gland. Of the 9 cases in the present series 2 were fatal. Intestinal hæmorrhage was a preceding complication in 4 of the 9 cases, and by causing anæmia of the mucous membrane and dryness of the mouth may have a contributing favour in favouring the parotid infection. It should also be remembered that the administration of morphia favours the development of parotitis.

RESPIRATORY SYSTEM.

I will not say much about the complications in the respiratory system. We had the usual cases of mild laryngitis and three cases of the severe ulcerative type which is so dangerous. (Table VIII.) A careful watch

TABLE VIII.—*Laryngeal Complications.*

has to be kept on these cases as the onset and course may be extremely insidious and the laryngeal disease may only be found at autopsy. At the first sign of either perichondritis or severe dyspnœa or stridor tracheotomy must be performed. Keen and Lüning have shown very clearly the danger of delay in these cases. Three of our typhoid cases were fatal, one man three days after tracheotomy.

My friend, Colonel Davies-Colley performed a timely tracheotomy in a case of ulceration of the epiglottis and aryepiglottidean folds and the patient recovered. As so often happens with typhoid ulceration, laryngeal stenosis occurred and all attempts at removing the tube were unsuccessful.

Considering the frequency of lung complications in typhoid-group infection the rare occurrence of surgical conditions is rather remarkable. Two cases of lung abscess were due to extension from liver abscesses. One recovered. The other case of lung abscess resulted from broncho-pneumonia. One case of empyema was the result of extension of a liver abscess, while another, an interlobar collection, followed pneumonia and was drained with success. Pneumococci were obtained in pure culture from the pus.

JOINT COMPLICATIONS.

The joint affections (Table IX.) met with in the course of these fevers may be divided into (I.) acute arthritis, which may be (*a*) serous or (*b*) suppurative; (II.) subacute arthritis, which is of a serous type, but may go on to suppuration.

Acute Arthritis.

I. (*a*) Quite early in the disease, even at the onset, one or, more often, *many* joints may be the seat of an inflammatory effusion producing a condition very like acute rheumatic arthritis and sometimes mistaken for it. In the present series there were three instances of this type of joint affection. Resolution as usual was complete. The fact that they occur early in the disease, during the stage of bacillæmia, points to these joint reactions being directly due to the specific bacteria of these fevers.

(*b*) Suppurative arthritis is a dangerous complication, and generally proves fatal. It may follow an acute serous arthritis or a subacute arthritis may become purulent, or, again, septic arthritis may be an incident in a general pyæmia or may be the result of extension of suppuration from an osteomyelitis in the neighbourhood of a joint. On the mode of origin of the septic arthritis will depend the time of its onset and also the number of joints affected.

There is abundant evidence of the pyogenic properties of the typhoid group of organisms, but as a rule suppuration in a joint is due to a mixed infection and the prognosis is correspondingly grave. Aspiration of the joint may be tried before proceeding to more radical measures, especially if the arthritis is due to a pure typhoid group infection.

Subacute Arthritis.

II. The type of arthritis in which surgical interest is chiefly centred in these fevers is the subacute form in which a serous effusion takes place quietly into one or occasionally more joints. We had four instances of this type, and they illustrate various points which are to be noticed in these cases. The large joints are affected as a rule, and the arthritis is generally monarticular, though occasionally more than one joint is involved. The onset is in the third week or later. There are more cases in the lower limb than the upper, and the hip is the joint most frequently affected. Recovery is complete as a rule, but in one case there was a tendency to stiffness, which was easily overcome.

The danger of these cases is not suppuration or stiffness, but that they may be so insidious in their onset and course as to be overlooked. The joint may gradually become distended and spontaneous dislocation takes place. Especially

does this apply in the case of the hip-joint, where large muscles mask the effusion. A careful watch must be kept on the large joints, and if a distending effusion develops the affected joint should be aspirated at once.

More and more evidence is accumulating to show that this form of arthritis is directly due to the specific bacteria of the patient's disease. In many cases on aspirating the joint no bacteria are found in the fluid, but from time to time one or other of the bacilli of the typhoid group is isolated. We have only succeeded in isolating the bacillus from one of our cases—a pure culture of *Bacillus paratyphosus B* was obtained from the fluid withdrawn from the case of arthritis of the hip. A striking point in other cases, however, was the character of the effusions which were examined by Captain A. G. Ritchie. The films were exceedingly rich in cells, which points to the effusion having been poured out to fight a bacterial invasion, and, since lymphocytes were numerous, to the invasion being a bacillary one. Probably the bacilli would be found in many more effusions if joints were aspirated early. Orloff's[6] experimental results point the same way, for after injecting joints of rabbits and dogs with cultures of *Bacillus typhosus* he found large numbers of cells in the effusions which resulted, and, in the earlier days, the *Bacillus typhosus*.

BONE COMPLICATIONS.

The *Bacillus typhosus* has been found in the bone marrow in a large proportion of fatal cases in which it has been sought for, and this tissue apparently plays an important rôle in the pathology of the disease.

Bone lesions are rare during the course of typhoid and paratyphoid fever and may be classed as sequels rather than complications as they generally occur in convalescence, or, maybe, months or even years after the patient's recovery. The commonest clinical manifestation of bone disease is an osteo-periostitis, but probably an infection of the bone marrow is the primary underlying cause in all cases. The lesion may suppurate or subside and may then recur; recurrence sometimes taking place more than once, and eventually the case may end in suppuration. The pus from these abscesses yields a pure culture of the specific organisms in a remarkable number of cases. One is forced to the conclusion that in a certain proportion of cases of the typhoid group of fevers infection lingers in the bone marrow, and when some impairment of general health or a local injury provides a focus of lowered resistance this is seized on by the typhoid or paratyphoid bacilli which have been lurking in the bone marrow all the time.

TABLE X.—*Bone Lesions.*

Disease.	Cases		Bone lesions.
Typhoid, inoculated	821	1	20th day. Swelling on 3rd rib; subsided.
,, not inoculated ...	297	3	30th day. Inflammation over left lower rib; subsided. 21st day. Periostitis of tibia; vaccine treatment, subsided. 35th day. Periostitis of rib; subsided.

,, not inoculated	221	0	—
Paratyphoid B, inoculated ...	239	0	—
,, not inoculated	729	1	30th day. Abscess in connexion with 9th, costo-chondral junction; aspiration; no recurrence.
Totals	2500	5	—

It has been customary to advise radical interference by free excision of the obviously infected tissues, together with a good area surrounding, in those cases which do not subside spontaneously. It has frequently been found that if a partial operation has been done a sinus has persisted for a long time, and in many cases a pure culture of the *Bacillus typhosus* has been obtained from a sinus many months after operation.

Very extensive operations have been undertaken in cases in which the ribs have been infected, but I think other measures should be tried first. If treated by open operation an attempt may be made to close the wound by suture in pure typhoid group infections. Armstrong has suggested puncture of the abscesses and the use of passive hyperæmia, but it is to vaccine treatment, I think, we must turn to rid the body—not only this small bone area—of the persisting typhoid group infection. Secondary infection makes the case much more acute and serious, and it must then be dealt with by free incision, as recognised to be necessary in ordinary septic disease of the bone.

Three of the five cases seen at No. — Stationary Hospital subsided spontaneously and had not recurred when the patients left France. (See Table X.) The tibial case in the course of typhoid fever did not subside at first, but when treated with vaccine great improvement took place.

In the case which occurred in the course of paratyphoid B a periostitis at the ninth costo-chondral junction went on to suppuration. Some pus was withdrawn by syringe and a pure culture of the *Bacillus paratyphosus B* was obtained. Paratyphoid vaccine was injected. On the fifty-fifth day the abscess was aspirated, and a few days afterwards there was nothing abnormal to be felt along the site of the lesion. A fortnight later the patient went to England and there was still no sign of recurrence.

These cases are very few, but the results are suggestive and make one think that aspiration of typhoid and paratyphoid bone abscesses, combined with vaccine treatment, may make the more radical operations less often necessary.

TYPHOID SPINE.

"Typhoid spine" is another sequel which may be regarded as a further instance of the special viability in the bone marrow of the typhoid group of bacilli. The lumbar and dorsi-lumbar regions are the parts of the spine most often affected, and Fraenkel found typhoid bacilli more frequently in the lumbar vertebræ than elsewhere, probably because of the larger amount of bone-marrow in them.

Typhoid spine was originally described by Gibney[7] in 1889 as a "perispondylitis," by which he meant a periostitis with inflammation of neighbouring fibrous structures, and cases reported since X ray examination has been the rule support the view that there is an organic lesion at the root of the trouble. McCrae[8] more than ten years ago demonstrated the deposit of new bone in two cases. Elkin and Halpenny[9] showed that of 72 cases reported up to the end of 1908 only 11 had been examined by X rays, but of 22 published between 1908 and 1914 X ray examination was carried out in 14, and in 11 some lesion was demonstrated.

The skiagrams show periostitis with effusion under the periosteum, changes in the intervertebral discs, and new formation of bone. Carnett[10] also published some convincing cases with X rays.

Long-continued pain in a debilitated individual may well account for exaggeration of symptoms, and in the face of the frequent demonstration of skeletal lesions it is not reasonable to attribute the symptoms entirely to neurosis.

These sequelæ of typhoid have made us realise for many years that recovery from the disease does not mean death of all the infecting organisms, and Keen insisted that a patient who had suffered from typhoid fever should only be allowed to resume the ordinary activities of life very gradually, and should be cautioned as to even slight accidents and warned against any severe physical exertion for several months after he has apparently recovered.

THE CARRIER PROBLEM.

During the last decade we have learnt to realise more and more that latent infections are not only a danger to the individual but also to the community, for in a certain number of cases bacilli are excreted from time to time either in the urine or fæces or both.

In the excretory channels chronic inflammation may be set up by the specific micro-organisms; in the biliary tract a chronic cholecystitis with or without gall-stones may result; in the urinary tract a chronic pyelitis may occur. No doubt a lesion exists in one or other excretory channel in many patients who are chronic carriers, but we have also to consider those cases in which bacilli are excreted either in the fæces or the urine for a long time after the patient is apparently cured and in which there is no sign of disease in the excretory channel concerned.

The Urinary Tract.

Taking the urinary tract first, if bacilluria is associated with pyuria it may be reasonable to regard a local condition in the urinary tract as the possible cause of the persistence of infection, but if there is no pyuria it seems to me that it is indicated to look elsewhere for some breeding-ground which from time to time discharges bacilli into the blood

stream, from which they are abstracted by the kidneys. Even with pyuria, and even if it is proved that excretion of bacteria is only taking place through one kidney, it does not follow that the typhoid condition is purely a local renal one, and it is advisable to seek elsewhere for an infecting focus. The permeability of one kidney only may be increased, and the presence of a local lesion may only be facilitating the excretion of bacilli and is not necessarily the breeding-ground of them. In Davies and Walker Hall's [11] case with five years' history bacilli were found in the blood at different times. The blood was examined during periods of bacillary excretion. Four times it was found to be sterile and twice yielded a strain of *Bacillus typhosus*. It is said that the bacilli were driven from the kidney into the circulation. It seems to me that too much attention is concentrated on the excretory channel, and that the explanation in many cases may well be that some other organ or tissue harbours the bacilli which find their way into the blood stream at intervals.

Bacilli latent in the Bone Marrow.

The question arises at once, Where is that tissue or organ? The bacilli may lurk in many places, but there are some which we know are likely harbours. We know that in the case of typhoid fever the bacilli are to be found in the bone marrow during the disease, and have been shown to be there as long as four months after recovery (Quincke [12]) without causing symptoms. We know that the bacilli may lie there, as other pathogenic bacteria are known to persist in the tissues, in a latent state without causing any disturbance. But they are always capable of doing so if the general health suffers, or some local trauma gives the bacilli the chance of getting the upper hand. Symptoms may then develop and an abscess may result as long as over seven years after convalescence (Buschke [13]).

This fact is very significant and suggestive when considered in relation to the carrier problem, for in the bone-marrow we have a tissue which is known to harbour the bacilli for long periods, and not only that, but it is amongst the parts of the body most constantly infected by them. We must, therefore, hold the bone marrow under suspicion of being concerned as a harbour for the infecting organisms in those patients who do not rid themselves of infection when they recover from the disease.

The Biliary Tract and the Spleen.

Now let us consider the biliary tract and the persistence of typhoid and paratyphoid bacilli in the gall-bladder. Again, attention has been concentrated on the excretory channel. It has been customary to look upon the gall-bladder, whether the seat of inflammation or not, as the great breeding ground of typhoid bacilli, when they have been found there at long periods after the original illness. To my mind, it seems safer to regard this tract as an excretory channel and to look further back for some other possible seat of vegetation and source of continual or repeated infection. Many of the contents of the bile, including bacteria, are simply the sediment from the hepatic filter which has turned these substances down from the blood brought to it from the gastro-intestinal tract and spleen—especially the spleen. The living organisms which get through are those which the liver has failed to kill.

Knowing the important part the spleen takes in combating typhoid and other infections by abstracting bacteria from the blood, we may for the present purpose look on the bile as the splenic effluent. We know how active the spleen is in ridding the circulation of infecting organisms, sometimes enlarging to a great size to deal with the extra task thrown on it. This function of the spleen is probably seen at its best in those cases in which a cholecystitis is the sole manifestation of typhoid, and in those in which bacilli are discharged with the bile and fæces, and the patient has never had any symptoms at all.

But we also know that this organ may become a source of continuous danger, by harbouring infective organisms, instead of ridding itself of them completely. This is well known in certain protozoal infections and is being recognised to an increasing extent with regard to other infections. Other parts of the body have been cleared of infection by stimulating the natural resisting powers by means of vaccines or by administering chemical remedies, but the spleen still persists in its bad habit. Splenectomy has been performed with success to rid the body of lingering infection in malaria (Jonnesco [14]) and in syphilis and pyogenic infection (W. J. Mayo [15]). The spleen is like a scavenger who removes refuse, and thus protects the community from many infective dangers, but who, if not scrupulously careful to attend to his own cleanliness, may become a source of danger by harbouring infective material, which he ought to have sent to the destructor. This dangerous character of the spleen seems to have been recognised in the Elizabethan era, in the literature of which period we find many apt references to this organ, for example—

> "Though I am not splenetive or rash,
> Yet have I something in me dangerous."

In typhoid and paratyphoid fever we know that organisms are found most constantly in the spleen during the attack and in some cases for a considerable time afterwards.

A man, aged 21, died at No. —— Stationary Hospital after being ill for 13 weeks and 5 days. Admitted for typhoid fever which was diagnosed by agglutination, he developed but few symptoms indicative of typhoid and soon was found to be suffering from tuberculosis also. At the post-mortem examination he was shown to have died of miliary tuberculosis, but typhoid bacilli were still present in his spleen in large numbers, though there were no other signs of typhoid about him.

Then in the case reported by Levy and Kayser [16] in 1907, a woman who was a fæcal carrier of *Bacillus typhosus* died three years after having had typhoid fever; typhoid bacilli were obtained from her gall-bladder and from inside a gall-stone, and also from her liver and spleen.

Similar cases have been described and are attributed to auto-infection from the gall-bladder, but some have died without any symptoms of auto-infection, and yet typhoid bacilli have been found in the spleen.

The chain of evidence is not complete, many tissues and organs may harbour the bacilli, but the spleen is under the greatest suspicion. Surgery may not be able to help in ridding the body of infection if it is scattered through many organs and tissues, nor be able to attack the infection if localised in the bone marrow, but if localised in the spleen and splenic effluent surgical aid may yet be invoked and splenectomy be undertaken for persistent typhoid or paratyphoid infection. When pathological conditions exist in the excretory channels treatment will have to be directed to those parts, but the possibility of other seats of vegetation being responsible for the continuance of the infection must not be lost sight of, and when faced with the failure of other methods of treatment surgery may be required to rid the body of this source of danger to the individual and the community.

COMPARISON OF CASES IN INOCULATED AND UNINOCULATED.

By far the most striking point of all in this review is the remarkable difference in severity of disease, incidence of complications and mortality between the inoculated and the non-inoculated. (See Table XI.) In compiling the statistical tables I have given the widest possible interpretation to the term "inoculated" and have included as inoculated all who have had any specific vaccine at all, whether they have had a full dose or not, and also whether or not it has been administered within the time for which it is claimed that protection is conferred. It would have made the tables too elaborate to have done otherwise. Patients with paratyphoid fever who have only been inoculated against typhoid have been counted as non-inoculated.

The statistical tables are convincing enough, but the difference in severity of illness is even more striking when you are brought into actual contact with the patients, for most of the inoculated are obviously suffering from a relatively mild disease. In the unprotected the mortality was more than five times as high as in the protected. This result may well lead to a moment's reflection especially amongst those of us who have been working at Boulogne base. There, under the eyes of its originator, Sir Almroth Wright, we have seen some of the benefits of protective inoculation against those fevers—we have seen this wonderful thing in the country of the great Pasteur and within a stone's throw of France's memorial to Edward Jenner, the founder of scientific protective vaccination.

In these times of war Anstey's ode to Jenner becomes again particularly apt. Ring's translation and paraphrase runs as follows:—

> "While deathless heroes, who maintain our fame,
> And add new glories to the British name,
> Around their brows unfading laurels twine,
> The civic crown, O Jenner, shall be thine."

TABLE XI.

Disease.	Typhoid, inoculated.	Typhoid, not inoculated.	Paratyphoid A, inoculated.	Paratyphoid A, not inoculated.	Paratyphoid B, inoculated.	Paratyphoid B, not inoculated.	Totals.

* This patient had lympho-sarcoma.

With regard to inoculation there is another point, which is possibly one of the most important. The specific bacteria are not found in either blood, fæces, or urine with anything like the same frequency nor in such numbers in the inoculated as in the non-inoculated, since the microbes are killed more rapidly and effectually owing to protective substances being in the body ready for the attack. It follows, therefore, that the sequels and after-effects of typhoid and paratyphoid infection must be fewer in the inoculated, and there is also less chance of infected individuals becoming "carriers" of the bacilli. Therefore not only is the inoculation of immediate and ultimate benefit to the individual and to the Army in largely preventing infection, as shown by the small incidence of cases; in controlling the disease in those who become infected and making the attack milder, complications and sequelæ less frequent, and mortality much smaller; but it will also be of lasting benefit to the community at home by diminishing the number of men who become "carriers."

CONCLUSION.

Before withdrawing from what in its preparation has been occasionally in times of stress rather an onerous task, I should like to refer to the way in which my work has been made a pleasure by the ready help and suggestions so generously given to me by my colleagues at the hospital.

When serving with the British Expedition to Belleisle, Hunter wrote home to his brother: "My fellow creatures at the hospital are a damn'd disagreeable set." No one could have written so from No. —— Stationary Hospital, where all were members of a team working together. We have been fortunate in securing the cordial assistance and coöperation of Colonel Sir Bertrand Dawson, to whom I am much indebted and very grateful for valuable help. To Colonel Andrew Fullerton I am also thankful for assistance and advice as freely given as sought. In the laboratory we have had a series of distinguished workers whose names are familiar to you owing to the contributions they have made to the bacteriological problems of typhoid and paratyphoid fever. Major G. Dreyer worked in the hospital for many months, and in charge of the laboratory we have had Colonel H. W. Grattan, Captain L. Wood, and Captain H. M. Perry, R.A.M.C., and to all of them I am indebted for help and suggestions. To all my colleagues in the wards I have incurred obligations for here a little and there a little. To Colonel C. R. Evans, D.S.O., the officer commanding, I owe a deep debt of gratitude for the way in which he has given me every possible facility; and to my friend Colonel Davies-Colley I owe a tremendous debt of thanks, for when he volunteered for service in Mesopotamia he left all his material, which he placed freely at my disposal. In fact, with so much assistance so readily given I feel "I have gathered a posie of other men's flowers, and nothing but the thread that binds them is mine own."

In working under war conditions I have not been able to refer to much material that I would otherwise have used, and perhaps I need offer no apology for the few references to the literature of the subject.

In conclusion, I wish to thank the members of the Council for the honour which they have conferred on me by electing me Hunterian professor to lecture on this important subject.

> "And here I will make an end,
> And if I have done well and as is fitting the story
> It is that which I desired; but if slenderly
> And meanly, it is that which I could attain unto."

SERUM DISEASE AFTER INTRATHECAL INJECTIONS OF SERUM.

BY H. D. ROLLESTON, C.B., M.D. CAMB., F.R.C.P. LOND.,
TEMPORARY SURGEON-GENERAL, ROYAL NAVY; SENIOR PHYSICIAN, ST. GEORGE'S HOSPITAL.

THE clinical aspect of serum disease is so familiar that some apology is necessary for raising the subject again, and this perhaps may be offered in a brief comparison between its manifestations after the intrathecal and after the more usual hypodermic method of serum injection. It might naturally be anticipated that intrathecal injection would make a difference, inasmuch as any local reaction in the meninges comparable to the rash sometimes seen to start from the neighbourhood of a hypodermic injection of serum might, from the proximity of the spinal cord and brain, cause special nervous symptoms. The following statements are based on analysis of the clinical notes of cases of cerebro-spinal fever in the Royal Navy.

Meningism due to serum disease.—During the third year of the war out of 96 bacteriologically proved cases of cerebro-spinal fever treated by serums and surviving for ten days or more, 58, or 60 per cent., had a serum reaction, as judged by the appearance of a rash. Among these 58 cases there were 9, or 15·5 per cent., in which the rash was preceded or accompanied by a more or less definite recrudescence of meningitic manifestations, thus, especially when preceding the rash, suggesting a relapse of the disease. These symptoms are relieved by lumbar puncture, and under the assumption that they point to a relapse a fresh injection of serum may be given, as was done in 6 out of the 9 cases. The 3 cases not so injected recovered, and of the 6 cases injected intrathecally with serum 5 were probably made worse, 4 eventually proving fatal, though it is not suggested that death was thus induced. The effect of intrathecal injection of serum presents some peculiar features. Whereas, as is well known, injection into a healthy intrathecal space sets up an aseptic chemical meningitis, injection of anti-meningococcic serum in cerebrospinal fever—as is shown by the clearing of the cerebrospinal fluid—reduces the inflammatory process, presumably by destroying the meningococci. In discussing the injection of immune serum in acute polio-myelitis, Neal, Abramson, and others[1] point out that injection of serum into slightly inflamed meninges sets up in most cases an acute aseptic meningitis shown clinically by fever, rigidity of the neck, and other signs of meningeal irritation. It seems probable that at the time of the serotoxic meningeal reaction the meninges are slightly inflamed, and that, as this is not due to meningococci, a fresh injection of serum aggravates the symptoms and possibly does harm rather than good.

It is therefore desirable to have some means of determining whether there is a genuine relapse which will be benefited by serum or whether the condition is one of meningeal irritation or meningism and a manifestation of serum disease which may be intensified by a further injection of serum. This diagnosis can be made by examination of the cerebro-spinal fluid for the presence of meningococci, and also for the normal reducing agent (glucose) which is absent in relapses of meningitis and present in the meningism due to serum disease (Reveillet, Nové-Josserand, and Langeron[2]). This test, which takes a few minutes only, and so enables a decision to be made on the question whether to withhold or inject serum at once, has been employed by Staff-Surgeon L. Warren, R.N., and by Dr. C. Ker at the City Hospital, Edinburgh, where some naval ratings were treated.

This meningeal manifestation of serum disease is peculiar to intrathecal injection of serum, and though it occurs in a small proportion of cases should be more widely recognised in this country in view of the war-time increase of cerebro-spinal fever. It has not, however, passed unnoticed. Netter and Debré[3] in 1911 gave a good account of it, and regarded it as a result of serotoxic œdema of the meninges. It may also be added that, as the mucous membranes originally attacked by diphtheria are liable to swell at the time of the serum reaction, an analogous sequence may be suggested in the case of meningococcic infection of the meninges.

[3] Netter et Debré: La Méningite Cérébrospinale, p. 264, Paris, 1911.

If the meningism is part of the serum disease to be expected after intrathecal injection, the question arises why it is not noted more often. It does not appear to result from large quantities of serum given, for out of the 9 cases among the 58 naval cases with a serum reaction, 8 had less than 100 c.c., and 4 of these 8 less than 50 c.c.; nor can it be explained as due to an intrathecal injection within a very few days of the appearance of the serum rash. That it is connected with some hypersensitiveness of the meninges is probable enough, but it is impossible to go beyond this vague statement.

The frequency of serum reactions after intrathecal injections.—Flexner[4] remarks that possibly the manifestations of serum disease are more frequent after the intrathecal than after the subcutaneous injection of serum, and at first some of the figures relating to the naval cases appear to confirm this; thus, out of 61 cases of cerebro-spinal fever which received Flexner's serum intrathecally only and recovered or (if fatal) survived more than 10 days, 43, or 70 per cent., had a serum rash. Whereas out of Currie's[5] 50 cases of cerebro-spinal fever treated mainly by subcutaneous injection (36 by subcutaneous injection only, 13 by one intrathecal and the other injections subcutaneously, and 1 case by one intrathecal, one intravenous, and the remaining injections subcutaneously), 29, or 58 per cent., had rashes. The incidence of serum rashes after ordinary hypodermic injections is given by Goodall[6] from analysis of a large number of cases, as about a third, so that the percentage of 70 is in excess of Currie's and Goodall's figures. But the naval cases, besides being rather few, were all injected with Flexner's serum, which seems to be specially effective in inducing a serum reaction. Out of 241 naval cases given various brands of serum (in some instances hypodermically as well) during the first three years of the war, and surviving for ten days or more, rashes occurred in 99, or 41 per cent. This is indeed lower than the incidence (44 per cent.) of serum rashes among 37,277 cases of diphtheria treated by serum during the years 1898–1903 in the hospitals of the Metropolitan Asylums Board, and very much lower than in some other series where serum rashes were specially looked for and found in from 67 to 81 per cent. of the cases (J. D. Rolleston[7]). It does not therefore appear to be proved that the incidence of serum disease is higher after intrathecal than after the hypodermic method of injection.

Bad effects from increased intracranial pressure caused by intrathecal injection of serum are so well known and the precautions necessary to avoid this accident so well recognised that they do not require further discussion.

Intrathecal injections of serum in rare instances are followed by *secondary infections* through the wound, especially after a large number of lumbar punctures. Secondary infection may also occur through the blood-stream, and it has been thought that this may be favoured by the injection of serum. Netter and Salanier[8] refer to 22 cases of secondary pneumococcic infection of meningococcic meningitis treated by intrathecal injections of serum during the first four months of 1917, when from the increased incidence of primary pneumococcic meningitis since December, 1916, the virulence of the pneumococcus was presumably intensified. These authors suggest that the injection of serum into the subarachnoid space, especially when large quantities of serum not corresponding to the type of the meningococcus present are given, may provide a better culture medium and so favour pneumococcic infection. But since a mixed meningococcic and pneumococcic infection of the meninges may occur before lumbar puncture, as was found in a naval case, it is clear that secondary pneumococcic infection does not necessarily depend on intrathecal injection of serum. Further, the secondary pneumococcic infection would appear to depend mainly on the virulence of the pneumococcus, for in a previous series of 300 cases of meningococcic meningitis Netter and Salanier[9] found 4 cases only of secondary pneumococcic infection.

To sum up: (1) Symptoms of meningeal irritation may precede or accompany the appearance of the serum rash.

[8] Netter and Salanier: Bull. et Mém. Soc. Méd. des Hôp. de Paris, 1917, 3e sér., xli., 789.
[9] Idem: Ibid., p. 394.

(2) Though serum disease is frequent after intrathecal injection of serum, especially after Flexner's antimeningitis serum, it is not clear that it is more frequent than after hypodermic injection of serum. (3) Intrathecal injection of serum necessarily involves risk of inducing increased intracranial pressure and may introduce a secondary infection; but it is not proved that the volume of serum injection favours a secondary infection of the meninges from the blood-stream.

A NOTE ON

SERUM SICKNESS IN CEREBRO-SPINAL MENINGITIS.

BY CLAUDE B. KER, M.D. EDIN., F.R.C.P. EDIN.,
MEDICAL SUPERINTENDENT, CITY HOSPITAL, EDINBURGH.

THE occurrence of what appeared to be an unduly large number of serum reactions in a series of cases treated with Flexner's serum suggested that a study of these reactions, especially with relation to any effect they might have on the subsequent course of the case, might prove interesting.

Summary of Cases.

There were 60 cases in the series, but a certain number of these died before there was any probability of a reaction occurring. However, 48 patients lived nine days or over, and 36, or 76 per cent., of these suffered from serum sickness. It is quite possible that this number would have been appreciably increased had the fatal cases included in the group lived a few days longer. The reactions were, as a rule, sharp, and in most cases were accompanied by considerable fever. The outstanding feature was, as usual, the rash, which most often started as an urticaria and ran into a multiform erythema. There was much skin irritation, and those patients whose consciousness was not blunted by their original illness were much distressed by the itching. Arthritis was only noted in 6 cases, but in these was very severe, and may have been present in a milder form in some others. Adenitis of the cervical glands was very well marked in two instances. An interesting point was the occurrence in 9 cases of prodromal fever for 12 or 24 hours before any other symptoms, and, as this was occasionally accompanied by an exacerbation or relapse of the meningitic signs, it was liable to be somewhat misleading.

More than two-thirds of the reactions commenced on the eighth, ninth, or tenth days from the date of the first injection. The actual dates are given in Table I.

TABLE I.—*Showing Days on which the Rashes Commenced.*

Day from first injection.	No. of cases.	Day from first injection.	No. of cases.
6th	2	11th	2
7th	4	12th	1
8th	7	14th	1
9th	13	21st	1
10th	5		

It will be noticed that more than a third of the total reactions commenced on the ninth day. In many of the cases the symptoms lasted for several days, on an average much longer than I have been in the habit of observing in diphtheria. Thus in 19 patients the rash was troublesome for four days and over, and in 3 it lasted for fully eight days.

Aseptic Meningitis.

It is now well understood that the introduction of horse serum into the spinal canal is liable to set up a local reaction which may be described as an aseptic meningitis. Thus the clear fluid of a case, which is ultimately proved to be tubercular, may after a serum injection be found to be distinctly turbid. In two such clear fluids polymorphs and large numbers of endothelial cells were found at the next tapping, but I have no other cases in which a second puncture was made. On the other hand, in 4 cases of cerebro-spinal meningitis, in which the fluid was improving after a course of injections but was still slightly turbid, Dr. Washburn, our bacteriologist, reported "a shower of fresh polymorphs" which stained well and contrasted strongly with the disintegrated and broken-up cells of the previous day's fluid. In all these cases the serum reaction and rash followed within a few days, and it appeared that a meningeal reaction was a prodromal sign of the more usual phenomena. The possibility, then, of a fluid becoming more turbid from this cause must be remembered, and in the absence of germs it is probably wise not to take an increase in turbidity too seriously. As my attention was drawn to this point somewhat late in the series of cases, I am inclined to believe that this change in the fluid may occur more frequently than I have noted.

In only two cases have I notes of the meningeal symptoms being aggravated during the actual serum sickness. The serum reaction in one of these was interesting. The patient had had four injections on the first four days of his treatment, and was punctured again three days later. On this occasion the fluid was clear, with no micro-organisms in the direct film, although they were detected next day in the incubated fluid. He received his fifth injection and the temperature rose to 100·5° F. the same evening. He became restless and vomited. The temperature remained up next day, and in the evening the first signs of an urticarial rash appeared. On the following day he had severe headache and turbid fluid was obtained on puncture. He was again injected, but his fever continued, arthritis was present, and his headache was again severe. He was again injected next day as the symptoms continued, and the fluid on this occasion was merely opalescent. On neither of these days were diplococci detected in the smears. The rash was now very profuse, and, although the fever continued, no further punctures were thought desirable for eight days, when a clear sterile fluid was obtained. The turbidity in this case appeared to be due to the serum reaction. Another patient, who showed marked head retraction during the period of his rash, was not punctured, as the facts seemed to point against a relapse. I may add that I found that Fehling's solution was reduced by all the fluids which appeared to become more turbid as the result of a serum reaction.

Incidence of Rashes after Intrathecal Injection.—Influence of Dosage.

The great number of rashes might suggest that intrathecal injection is more liable to cause them than the subcutaneous method. I do not think, however, there is any reason to believe this to be the case. In the first place J. D. Rolleston[1] has reported from 69 per cent. to 81 per cent. of rashes following subcutaneous injection of horse serum. While I have never observed such a high percentage, it is not uncommon to find that the use of certain consignments of serum is followed by the appearance of an unusually large number of rashes, and it is generally admitted that the blood of some horses is much more irritating than that of others. I fancy that the large number of reactions following the use of this particular serum of Flexner is due to some peculiarity of the horses. Sophian has observed rashes in 60 per cent. of his cases. Our own experience of intrathecal injection at the Edinburgh City Hospital is illustrated by Table II., which shows that, while one other serum gives a percentage nearly as high as Flexner's, intrathecal injection does not invariably cause an undue amount of serum sickness.

TABLE II.—*Percentage of Rashes.*

Serum.	No. of cases.	Percentage of rashes.
Flexner (1907-08)	28	25
Burroughs Wellcome (1915)	19	26
Parke, Davis and Co. (1915)	10	40
Lister Institute (1916-17)	7	71
Flexner (1916-17)	48	75
All cases	112	50·8

My records do not show that the occurrence of the rash is much influenced by the dosage. Of four patients who did not suffer from cerebro-spinal fever, but who received a dose of serum on admission, two, or 50 per cent., had reactions. Of 11 cases of meningitis in which no reaction occurred, one received seven injections and five others as many as five, the remainder receiving a smaller amount. For some time I believed that an injection given after an interval of two or three days tended to produce an almost immediate reaction, and many of our charts strongly suggest such a view. But in the first place 18 patients, who had only a course of from

[1] Practitioner, May, 1905.

three to six daily consecutive injections and no subsequent intrathecal treatment, had rashes; and, secondly, a careful study of the charts showed that the later injections, given after an interval in the remaining cases, were very often from the eighth to the tenth day after admission—in other words, just at the period at which a rash might be expected in any case.

Effect on Course of Case.

It might naturally be asked what effect sharp attacks of serum sickness, lasting in some instances for as long as six or eight days, have in the course of the case? Personally I have been accustomed to regard them more as an advantage than otherwise. In the case of diphtheria I have for long been convinced that a smart reaction, especially when accompanied by pyrexia, is often of the greatest benefit to a patient with a poor pulse and subnormal temperature, and seems to stimulate the recuperative powers. Rolleston, in the paper above quoted, considers that the occurrence of rashes is to be regarded as a favourable prognostic sign. It is only fair, however, to admit that my own views on this question do not find general acceptance. Nevertheless I think many cerebro-spinal patients are much improved by these reactions, and in no case, when their nature was recognised, have the latter caused me anxiety. It is difficult to say to what the benefit is due, probably to some stimulation of metabolism and the processes of repair, as I take it to be the case in diphtheria. But our predecessors were accustomed to blister and counter-irritate in cases of meningitis, and presumably, in their experience, benefit, if only of a temporary kind, was obtained by this procedure. It would be difficult to devise a more thorough system of counter-irritation than is provided by most of the rashes I have seen with this particular serum, and I am prepared to believe that in cases which apparently are threatening to enter the chronic stage the improvement may be due to this cause.

One other point remains. While I personally have not persisted with injections through more than two or three serum reactions, I have not, on the other hand, observed any special ill-effects in doing so. But I understand accidents have been reported, and my present practice is not to inject in presence of a serum reaction unless the diplococci in the spinal fluid appear to be increasing. The Fehling test is a useful means of determining whether a rise of temperature, with an exacerbation of meningeal symptoms, is caused by a reaction or by a recrudescence of the disease.

EXAMINATION OF THE URINE IN CASES OF RELAPSING FEVER OCCURRING IN MACEDONIA.

BY LEONARD S. DUDGEON, F.R.C.P. LOND.,
LIEUTENANT-COLONEL, R.A.M.C. (TEMP.); CONSULTING BACTERIOLOGIST, SALONIKA ARMY.

THESE investigations include the examination of the urine in 100 cases of relapsing fever, but only 89 samples were examined for the organism of the disease. The cases occurred in Macedonia and included all ranks of the Salonika Force, muleteers, and Greek labourers. In most instances lice were found in the clothes, but instances occurred in which there was complete absence of lice, and further, the skin of these men was free from suspicion. Most observers consider that lice are the carriers of this infection, others also include the bed-bug. Stitt states as follows: With the European relapsing fever bed-bugs have been suggested as transmitting agents, while Castellani gives his opinion to the effect that relapsing fever may possibly be transmitted by bed-bugs, but more probably is spread by lice.

In these investigations the spirochæta of relapsing fever was found in the urine on 27 occasions out of the 89 specimens which were especially examined for this purpose. This total is very high, and as the organism was present on some occasions in very large numbers it is possible that its presence is of importance as regards the question of infectivity of the urine. If infection can spread in this way, as is quite probable, then every possible care should be adopted to avoid carrying urine about in such a manner that a fair proportion is upset over the individual who is transporting it. It is a remarkable fact that at the present day every precaution is taken to avoid contamination of soil with normal urine, and yet abnormal and infectious urine may be transported from one end of a hospital to another, or even further, in an open glass vessel, or perhaps a paper cap may be applied, but no further precautions are adopted.

These facts are rendered even more important if we refer to the Memoranda on Medical Diseases in the Mediterranean War Area published by the War Office. Here a statement is made which will be quoted as printed: "Remember that the spirochæte has been found in the sweat and in the tears and that it has been proved capable of passing through intact mucous membrane and the unbroken skin."

The Examination of the Urine.

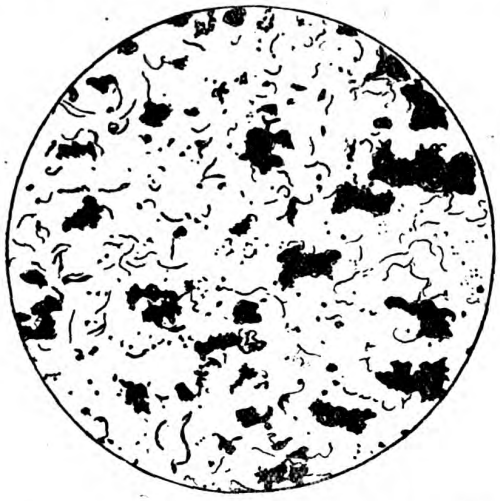
The urine was collected in large test-tubes, which were closed with sterile plugs fitted with care after soaking in melted paraffin. These plugs were warmed just before the tubes were required. It is necessary to mention at the outset that the urine was sent to the laboratory as soon as possible after it was collected, but as the infectious hospital is situated on the mountain side some miles from the laboratory ideal methods, so easily accomplished in England, were not possible on every occasion. Further, in many instances specimens were obtained before and after special treatment had been adopted. The samples of urine, as soon as they were received, were centrifugalised at high speed in an electric centrifuge.

The clear urine was examined for albumin and the deposit was made use of as follows: Film preparations were made on glass slides, dried at 37° C., fixed in formalin vapour for one hour, and redried at 37° C. The films were then treated by the Levaditi method for the staining of spirochætæ in the tissues and then examined in the usual way. Other film preparations were dried at 37° C., fixed in alcohol, and then stained for 20 hours by Giemsa's method, but this was not found to be as satisfactory, as the spirochætæ were very difficult to find owing to the presence in the deposit of numerous casts and cells which obscured the fields of vision. Hanging-drop preparations were made and examined with dark-ground illumination, but owing to the presence of innumerable filaments which are liable to give rise to error, and also to the bulky deposit which is present so often in these samples of urine, little reliance could be placed on this method of examination. The pyridin method was employed, but staining with nitrate of silver, as in the Levaditi process, was found to give the best results. The remainder of the urinary deposit was examined in the fresh state for casts and cells.

No cultural experiments were made, and animal inoculations, with the exception of guinea-pigs, were not possible, as monkeys, rats, and mice cannot be obtained in Macedonia for experimental purposes. Guinea-pigs inoculated with the infected urines from patients with relapsing fever did not show any ill effect, but after a period of ten days they were killed, the livers emulsified in saline, and other pigs were injected with the extracts intraperitoneally, but without effect.

The urine obtained from the cases of relapsing fever was examined at the commencement of the febrile attack, after specific treatment had been completed, and again at various intervals during the period of convalescence, because at the present time it is the custom here not to discharge patients from hospital until the urine is found to be normal.

The presence of albumin.—In the majority of the cases albumin was present, from a trace to a very obvious amount, but in some instances it could not be detected by the picric-acid or boiling test, although casts were found; usually, however, in such cases albumin was demonstrated at a later period of the disease. Once convalescence was established the urine gradually returned to the normal.



Deposit in the urine.—Every specimen of urine was centrifugalised at high speed and the deposit examined in the fresh state. Casts were usually found, especially hyaline and granular, which were often present in the deposit in very large numbers; epithelial and leucocytal casts were common, but red cell casts were comparatively uncommon. In addition to the presence of casts in the urine, red cells and leucocytes were very numerous on many occasions and also epithelial cells from the urinary tract. Uric acid crystals were abundant but generally subsequent to the acute stages or to the period of active treatment with one of the arsenical preparations.

Numerous observations were made on the condition of the urine before and after treatment with kharsivan. At the infectious hospital it is customary to give 0·25 gm. of this drug intravenously as soon as the disease is diagnosed, and in many instances distinct improvement in the condition of the urine occurred, usually gradually, but occasionally rapidly. It is important to remember that a heavy trace of

albumin and numerous casts in the urine do not contra-indicate the employment of kharsivan intravenously, otherwise such treatment could not have been employed in this series of cases. In the book published by the War Office on Medical Diseases in the Mediterranean War Area it is definitely stated that even if albumin is present this line of treatment is not contraindicated. Further improvement in the condition of the urine occurred after the injection of the drug and was maintained, and it was not uncommonly noticed that the albumin and casts diminished as soon as the kharsivan had had sufficient time to produce its effect.

Morphological Characters.—Notes of Cases.

The morphological characters of the spirochæta found in the blood in these Macedonian cases showed several coarse spiral turns and numerous figures of "8," while it had a great affinity for the ordinary stains. The long straight spiral with the faintest deviations from the straight line was uncommon. In cultures of glucose citrated broth, as employed by Clarke and myself for the cultivation of *Plasmodium falciparum*, the coarse spirals could be found in enormous numbers and had a great tendency to agglutinate and to show beading after 24 to 40 hours life outside the body. In the urine spirals with coarse turns were present and twisted elements of various shapes, while spirals with tapering extremities were common. In most instances much time was required to find the spirochætæ in the slides stained by Levaditi's method because of the extraneous matter which stained black and was present in large amount. On a few occasions spirochætæ were numerous in the preparations of the deposit as shown in the accompanying drawing

Urinary deposit from a case of relapsing fever, showing large numbers of spirochætæ. (Stained by Levaditi's method.)

In the case of an officer who contracted this disease, but who was considered to be suffering from malaria on clinical evidence, the result of the examination of the urine suggested relapsing fever before the blood was examined. The condition of the urine in this case is of sufficient interest to record in detail.

When this patient's blood was first examined his temperature was 102·8° F., and spirochætæ were demonstrated in the blood smears, while the urine contained much albumin, many red cells, epithelial cells, and numerous spirochætæ. The temperature fell to normal after kharsivan, casts disappeared from the urine, the albumin diminished, and finally disappeared. Six days from the height of the illness the temperature was normal, but spirochætæ were present in the urine, together with a certain number of epithelial cells, while a similar result was obtained eight days later, except that numerous red cells were found on this occasion. At the end of 14 days from the onset the urine became and remained normal until the examinations were completed.

It is of interest to record that in no less than five instances spirochætæ were found in the urine before they were demonstrated in the blood.

Bile pigment was absent from the urine in every case and true jaundice was not noted.

One fatal case occurred on whom I made a complete post-mortem examination.

The analysis of the urine before death showed a trace of albumin, red cells, numerous granular and hyaline casts, leucocytes, and epithelial cells. Urine taken from the bladder at the autopsy which was made a few hours after death, showed an increased amount of albumin and all possible varieties of casts, but blood casts were especially numerous. In each instance spirochætæ were found in the urine by the method of Levaditi. There was evidence of chronic inflammation and diffuse degeneration of the tubular epithelium throughout the kidneys, but especially of the convoluted tubules, while numerous casts were present in the lumina of the tubules. Smears made from the lungs in the region of the pulmonary hæmorrhages revealed numerous spirochætæ when stained with Giemsa, but none could be demonstrated in the tissues by the method of Levaditi.

I am greatly indebted to various officers of the Salonika Force for their assistance during these investigations, but especially to Lieutenant-Colonel Cross, officer in charge of the infectious hospital, for invaluable help, and to one of his officers, Captain Stewart, M.C., for every possible assistance rendered on numerous occasions. The excellent black-and-white drawing which accompanies this communication was made for me by Private Panichelli.

Addendum.

Since this communication was sent to THE LANCET two important papers have quite recently appeared in the *British Medical Journal*.

Lieutenant Stoddard[5] considers from his personal experience that (1) spirochætæ are not uncommon in the male urethra without signs of relapsing fever; (2) that many varieties are met with; (3) that spirochætæ are a source of contamination in uncatheterised urines. He examined 100 men, of whom 50 included cases of all kinds and 50 men from U.S.A. who were in excellent health, while none of the series had ever suffered from "relapsing fever," or more correctly fever of a relapsing type, in his opinion. As a result of these observations 46 per cent. of urethral films showed spirochætæ, while if the *refringens* type is included it amounted to 56 per cent in series (1), while in series (2) 20 per cent. were found, or 22 per cent. if we include the *refringens* form. Lieutenant Stoddard ascribes the difference in the results which he obtained to a question of health, as the sick men will give a higher percentage of spirochætæ in the urethra than the U.S.A. men who were so fit. In a large percentage of his cases spirochætæ were numerous in the film preparations of the urethra.

Major Patterson[6] records his observations on the examination of the urine for spirochætæ which are not exactly in agreement with the results or conclusions as given by Lieutenant Stoddard. These observations are based on the examination of the urine in certain clinical types of P.U.O., and he found that: (1) Spirochætæ occur in the urine in cases of trench nephritis; (2) abdominal types of P.U.O.; (3) relapsing types of P.U.O. (trench fever). The spirochætæ which he found in the urine were very resistant to staining, as they were uncoloured by Leishman, Romanowsky, and Giemsa, and required a mordant, while they were found in the urine often abundantly after the rise of temperature.

My own observations are based on the examination of cases of European relapsing fever in Macedonia, and not with cases of fever which on clinical evidence are said to have "relapsed," as this group is considerable and would include the majority of diseases as met with in the Balkans. The spirochæta of relapsing fever, as met with here, when examined in the fresh state by dark-ground illuminations, preserves a perfect corkscrew shape, while similar material fixed and stained with Giemsa will show, in addition to the typical corkscrew spirochætæ, many others in which the corkscrew appearance is more or less lost or most irregular. This distinction between the morphological characteristics of the spirochæta in the fresh state and the preparation stained with Giemsa is still further exaggerated when a comparison is made with the Giemsa stained preparation from urine and those made with Levaditi. In my opinion the morphological appearances are very dissimilar under these varying conditions.

If we next refer to the high percentage of positive findings obtained by Lieutenant Stoddard in his first series among men of whom it was possible to exclude any form of "relapsing fever," it is at once apparent that his results show a much greater percentage of positive findings than in my series, in spite of the fact that the Balkan cases were suffering from true relapsing fever. Further, the majority of these cases had albumin, or red cells, or casts which were often abundant in the urine, with the spirochætæ. The low condition of health would be a common factor in each series. It is, however, the appearance in the urine of albumin, red cells, and casts which is so important in the urine of true relapsing fever, and serves as an explanation for the presence of the spirochætæ in the urine. The

findings of Lieutenant Stoddard, however, are extremely important, especially as we are in the "spirochætal period of medicine" at the present time. A catheter was never employed in my cases, because I consider that warm urine is the best flush for the urethra, and have long discarded catheters, as in my opinion passing "rods" along the urethra is not to be recommended for bacteriological purposes except when circumstances especially demand it.

"COLLOSOL" COCAINE.

BY G. BARGER, M.A., D.Sc., H. H. DALE, M.D., F.R.S.,
AND
FLORENCE M. DURHAM.

(*From the Department of Biochemistry and Pharmacology, Medical Research Committee.*)

IN April and May of this year statements were published in THE LANCET (April 28th and May 19th) and *British Medical Journal* (May 5th and 19th) which embodied preliminary reports on the above preparation of cocaine by Professor R. Tanner Hewlett, Professor W. J. Simpson, and by Dr. John Eyre.

It was claimed that cocaine in this form retained its local anæsthetic action, but had lost its general toxicity; and the observations described in the reports seemed to afford justification for such a conclusion. If the statement could be accepted, it would obviously have not only practical importance but theoretical interest of a very high order. It did not appear to us to have any obvious relation with the colloidal condition of the alkaloid, which was put forward by the manufacturers in explanation of the anomaly. We decided to investigate the matter further, but our observations have failed to confirm the existence of the suggested disparity between toxicity and anæsthetic power. In the samples which we examined the toxicity was, indeed, much lower than that of an ordinary 1 per cent. solution of a cocaine salt; but the local anæsthetic action was low to a corresponding degree, and both actions corresponded satisfactorily with the proportion of cocaine chemically recoverable from the solution.

It seems desirable to publish our results, in view of the publicity given to the earlier observations. We believe that we can indicate some sources of error in these, and the exposure of a trap in which experienced observers seem to have been caught may always have value for others. We wish to make it clear, however, that we have no reason whatever to doubt the bona fides of the manufacturers, who have withdrawn "collosol" cocaine from their list on hearing from us of our conclusions. Our criticism is concerned with "collosol" cocaine alone among their preparations, though less easily tested claims, made on behalf of other "collosol" alkaloids, should, in our opinion, lose what indirect support they seemed to receive from the earlier observations on "collosol" cocaine. The allegation that a substance is presented in colloidal solution should not be regarded as sufficient ground for a claim that it possesses properties otherwise mysterious or incredible.

On consideration of the earlier reports and of the information given to us by the makers, it appeared that several points required further investigation.

1. The local anæsthetic action should be determined in a more quantitative manner. The degree of anæsthesia produced in the rabbit's eye by a given solution of cocaine varies widely in different animals. We compared the various samples of "collosol" cocaine with solutions of cocaine hydrochloride of known strength, making each comparison by instilling equal quantities of solution into opposite eyes of the same rabbit or into the same eye with a sufficient interval for complete recovery. The test stimulus was kept uniform and the duration of the different degrees of anæsthesia recorded in each case. In this way we were able to recognise that none of the five samples examined approached a 1 per cent. solution of cocaine (as hydrochloride) in anæsthetic action. Three of them had an action nearly equivalent to that of 0·25 per cent. cocaine, the other two had a much weaker action, so weak that a concomitant irritating effect, presumably due to other constituents, made it impossible to match the activity with that of a pure cocaine solution.

2. The toxicity of cocaine given by intravenous injection varies very widely with the rate at which it is introduced into the circulation. If a solution which is supposed to contain 1 per cent. of cocaine, but in reality contains much less, is injected at the same rate as a standard 1 per cent. solution, the real discrepancy between the toxicities will be very greatly exaggerated. For comparison of toxicities of cocaine solutions by this method all injections must be made at the greatest rate compatible with the avoidance of injury to the heart by mere volume effects.

We chose for tests of toxicity the three samples of which the anæsthetic action corresponded to that of 0·25 per cent. cocaine. One was tested by hypodermic injection into mice, the second by intravenous injection into rabbits, and the third by both methods. Material was not available for very exact determinations, but in every case the lethal dose of the "collosol" sample was four times that of a 1 per cent. solution of cocaine, within the limits of accuracy set by the nature of the test and the number of experiments possible. Two of the preparations appeared to contain some substance which depressed the tremors and convulsions seen with non-fatal doses of pure cocaine, but this action did not appear to raise the lethal dose.

3. The same three samples were examined chemically, the solution being made alkaline with ammonia and shaken with successive quantities of ether. The washed ethereal extracts were united and evaporated and the residue of cocaine weighed. From one sample the cocaine was obtained pure and crystalline, with the correct melting point. The residues from the other two contained traces of non-crystalline material, but had the physiological action of pure cocaine. In each case the quantity of cocaine obtained was approximately 24 milligrammes per 10 c.c. of solution—i.e., 0·24 per cent.

4. Part of one sample was filtered through a wet collodion membrane under a pressure of about 25 cm. of mercury. The colouring matter in the solution was held back by the membrane, the filtrate being quite colourless. The cocaine was extracted from the filtrate and weighed, the quantity found being 23 milligrammes per 10 c.c., or 0·23 per cent. Allowing for the wetness of the membrane, it may be said that the cocaine passes quantitatively through it. The cocaine which is present is, therefore, in the form of an ordinary salt, and is not in colloidal solution.

Conclusions.

1. The local anæsthetic action of three samples of "collosol" cocaine corresponded roughly with that of a 0·25 per cent. solution of pure cocaine. In two other samples it was much lower.

2. The toxicity of the three better samples was about one quarter of that of 1 per cent. cocaine.

3. The quantity of cocaine chemically recoverable from each of the same three samples was approximately 0·24 per cent. instead of 1 per cent. as indicated.

4. The cocaine which was present passed freely through a collodion membrane, and was therefore not in colloidal solution.

DONATIONS AND BEQUESTS.—Aberdeen University will benefit to the extent of some £12,000 under the will of Dr. Archibald Carmichael, formerly of Barrow-in-Furness, and latterly resident in Perth, who died on Feb. 22nd, 1916, bequeathing to the University the residue of his estate, subject to certain life-rents, with the instruction that the income thereof should be applied "for the advancement of the work of the medical side of the University in such manner and subject to such regulations as the Senatus Academicus of the same University may from time to time determine and think fit." Dr. Carmichael was a native of Mary Culter and a graduate in arts and in medicine of Aberdeen University.

Medical Societies.

ROYAL SOCIETY OF MEDICINE.

SECTION OF MEDICINE.

Manifestations of Serum Disease which may Follow Intrathecal Injections.

A MEETING of this section was held on Nov. 27th, Surgeon-General H. D. ROLLESTON, R.N., the Vice-President, being in the chair, when short papers were read on the Manifestations of Serum Disease which may Follow Intrathecal Injections. Surgeon-General ROLLESTON'S paper appears in full on p. 821 and Dr. CLAUDE KER'S on p. 822.

Lieutenant-Colonel E. W. GOODALL said that prodromal fever had been noticed after the subcutaneous injection of serum. Fever did occur without a rash and one manifestation might be a temperature without irruption. The proportion of rashes varied with the serum used. No doubt, if the patients who died during the latent period were excluded, 40 per cent. of the remainder would have had rashes. The severity of serum sickness was not nearly as bad as when serum was first introduced.

Dr. J. D. ROLLESTON thought that the severity of the rashes was determined by the size of the dose and varied indirectly to the severity of the attack.

Major C. R. BOX drew attention to the absence of rashes when precipitated antitoxin was used. Numbers of men in the Army had been injected with tetanus antitoxin, and might get cerebro-spinal fever later. What was the likelihood of their getting anaphylaxis? He thought that the percentage of rashes might be linked up with the amount of foreign protein given. Figures from two General Hospitals showed that the rashes only amounted to frem 2 per cent. to 5 per cent. of the cases injected, and might be due to the small amount of protein administered as the unitage was high.

Lieutenant-Colonel GOODALL said that the strength of unitage had gone up, but the volume to be injected had gone up also. Many soldiers had frequent injections of antitoxin, but the number who got anaphylaxis was very small.

Dr. R. A. O'BRIAN also spoke, and Surgeon-General ROLLESTON briefly replied.

SECTION OF OTOLOGY.

Exhibition of Cases and Specimens.—Gastro-intestinal Sepsis a Cause of Ménière's Symptoms.

A MEETING of this section was held on Nov. 16th, Dr. H. J. BANKS DAVIS, the President, being in the chair.

On the proposition of Mr. HERBERT TILLEY, seconded by Dr. WILLIAM HILL, a cordial vote of thanks was accorded to Mr. H. J. MARRIAGE, the retiring President.

The new PRESIDENT, in the course of an address, reminded members of the section, who were all specialists, that its proceedings were widely read by medical men who might not have the same opportunities as they themselves had for acquiring a special knowledge of otology. He said that because there was a tendency to report upon and exhibit at these meetings only cases of rare or special interest which might exclude much information concerning types of cases commonly met with. The experience of all was worth recording, though everybody's opinions might not be. He regarded it as a duty of the section to promote knowledge among the general body of the profession. The subject of special debate for the winter would be "The Influence of Abnormalities and Diseases of the Nose on the Ear," a topic which had an important bearing on aviation, as flying men with nasal obstruction were liable to be handicapped by disturbances of equilibration when flying. In a minor degree this applied also to gunners in the naval and military services. Other aspects of the specialty calling for further investigation included the best after-treatment following operations on the mastoid, the best treatment for shortening the duration of Eustachian catarrh with simple catarrhal otitis media (a common condition during the war), the alleviation of the symptoms of otosclerosis, how these can be distinguished from those of chronic adhesive catarrh, and tinnitus, "the bugbear of otology."

The PRESIDENT showed a green pea which he had extracted from the middle ear of a boy aged 10 years. Examination of the ear in the casualty department revealed nothing, but as facial paralysis supervened the patient was admitted into the hospital, and Dr. Davis, by the post-aural operation, extracted the pea, with husk complete, which had swollen to the size of a hazel nut.

Mr. E. D. D. DAVIS showed a case of war injury to the ear, due to a shell wound of the left malar region, which also destroyed the sight of the left eye. Granulation tissue was present in the left external auditory meatus and a healing perforation of the posterior inferior quadrant of the drum. The loss of hearing was considerable and likely to be permanent. He did not think the deafness was functional.—Dr. PERRY GOLDSMITH considered there was a functional element in the case, as he could not understand why a wound in the position mentioned should have destroyed the man's drum.

Mr. SOMERVILLE HASTINGS showed a case of cholesteatoma which exposed the lateral sinus. The patient, a woman aged 33, seen last July, gave a history of chronic discharge from the right ear for eight years, and pain in this ear during the last few weeks. She had never had an operation on the ears. The right ear was filled with pus and epithelial débris, and removal of this disclosed a large smooth-walled cavity, all trace of the membrana tympani and ossicles being lost. The lateral sinus was exposed for half an inch and could be seen pulsating. Hearing in this ear was very defective. There was no need to operate here, as Nature had operated.—Dr. HILL drew attention to the fact that sometimes the lateral sinus was situated in a forward position, a possibility which surgeons should have in mind during ear operations.—The case was fully discussed.

Mr. W. M. MOLLISON showed a man, aged 21 years, with complete deafness and almost complete loss of labyrinth function.—Mr. J. F. O'MALLEY, suspecting the case to be functional, detailed the plan which he had successfully followed in detecting and curing such conditions.—Mr. SYDNEY SCOTT mentioned the means carried out at the National Hospital for the Paralysed with the same object.

Major E. B. WAGGETT sent a short contribution on a case of Myasis of the Ear. It was due to the flesh-fly, *Sarcophaga carnaria*, specimens of which accompanied the paper.

Mr. T. MARK HOVELL read a paper on Gastro-intestinal Sepsis a cause of Ménière's Symptoms. He said that outside the ranks of otologists there was a tendency for patients suffering from the group of symptoms which Ménière described to be regarded as having incurable ear disease. The paper dealt only with cases in which patients had middle-ear disease and in whom the reason of the symptoms was not apparent. Many of the patients benefited had the following conditions present when first seen: furred tongue, congested pharynx, naso-pharyngeal catarrh, hypertrophic rhinitis, flatulence, frequently considerable distension, constipation. The blood pressure was usually high, sometimes the heart was dilated, and the Eustachian tubes were in most cases closed. Considering the high blood pressure, the presence of tinnitus and giddiness was not to be wondered at. He had directed his attention to remedying the gastro-intestinal condition, to obtaining specimens of stomach contents during fasting, and the preparation therefrom of a vaccine as adjuncts to treatment. No measures for reducing blood pressure would succeed unless the intestinal tract were restored to a healthy condition, towards which the giving of full doses of castor oil was a great help. Locally, the injection of air into the tympanum lessened the Eustachian distress, but for permanently restoring the patency of those tubes the best measure he knew was the injection into them through a catheter of a few drops of collosol argentum, which should reach the tube in the form of a spray. To lessen the naso-pharyngeal catarrh, collosol argentum, or collosol iodine was useful, sprayed directly backwards through the nostril. The first of these remedies he had also found useful for relieving earache. Collosol preparations should not be given in conjunction with arsenic, as poisoning might ensue.—The paper was discussed at length.

The report of the Committee of Otological Research was presented to the meeting, and the members of the committee—Mr. Marriage, Mr. E. D. D. Davis, Mr. Somerville Hastings, Dr. Fraser, Dr. A. Gray, Mr. Hugh Jones, Sir William Milligan, and Mr. Sydney Scott—were cordially thanked for their labours.

MEDICAL SOCIETY OF LONDON.

Resumed Discussion on the Value and Limitations of Sanatorium Treatment for Tuberculosis.

A MEETING of this society was held on Nov. 26th, Sir STCLAIR THOMSON, the President, being in the chair, when the discussion on the above subject was resumed.

Dr. W. CAMAC WILKINSON said he thought sanatoria indispensable in the treatment of certain forms of tuberculosis, but the present system could not touch the fringe of the disease, for in those classes who could not pay for their own treatment, including, after the war, soldiers and dependents, there would be 300,000 victims. There were 11,000 beds in sanatoria, and all authorities now admitted that each case needed, on an average, six months' residence. Thus there would be room for 20,000 every year. This meant that 6·6 per cent. of these victims could have treatment in one year and 50 per cent. of these were dead in 3 to 4 years, so that benefit was chiefly limited to 3·3 per cent. of the total. Thus, 93·3 per cent. of the cases needing treatment could not enter a sanatorium for at least a year. In other words, 20,000 cases are treated and 280,000 are left out, and the problem should not be discussed as affecting only a small portion of the victims. The pecuniary loss to the nation from prolonged residence in sanatoria was, he said, from £2,500,000 to £4,500 000 every year. The alternative scheme which he advocated was in full working order in Sydney, and tables showed the efficacy and economy. Every remedy which could increase the value of sanatorium measures or diminish their limitations should be discussed, and he knew of none which yielded such satisfactory results as the specific remedy called tuberculin, but it must be used according to the approved method which had secured these results.

Dr. G. A. CRACE-CALVERT thought that statistics suffered because the patients who had gained permanent benefit did not report again to the sanatorium, and that sanatorium treatment should be given before home treatment. Sanatoria were of value because a patient came under the care of a physician who could advise him on all conditions of his life, which he could be taught to regulate, while the moral and educational effects were useful. The majority obtained quiescence of the disease, which might go on to arrest. The unsuitable cases were the acute, auto inoculations, alcoholics, and patients of the flabby type. Three months was the least which should be spent in a sanatorium, and he advocated the starting of colonies along the lines of the Cambridge After-Care Colony.[1]

Dr. HENRY ELLIS said that sanatoria, from a national point of view, were a failure; the number of beds was increased to 11,000 without a drop in the death-rate; but from the point of view of the individual they were of enormous value. Sanatorium figures were very unsatisfactory, as they were limited to cases showing tubercle bacilli in the sputum, cases not being counted until there was tissue destruction. Sanatoria were most valuable in early cases, least valuable in bad cases. There should be separate sanatoria for each class. Lighter treatment was required along the lines of the convalescent home, for even a short time away from work would improve enormously the condition of the tuberculous. Australian figures showed that the mortality among the independent classes was greater than among the working classes. In this country more than 50 per cent. of patients died within six months of notification. We were not scientific where tuberculosis was concerned, he pointed out, for while we knew that sanatorium treatment was good for early tuberculosis and we eliminated early tuberculosis from our statistics; we knew that delay in sanatorium treatment was fatal to success, yet we had waiting lists; we knew that a man's environment, by lowering his resistance, produced the disease, but we did nothing to make his environment better; we knew that early recognition was the keystone of success, but were we doing anything to investigate how early recognition might be made more simple and certain?

Dr. JANE WALKER thought that the results of sanatorium treatment were disappointing if regarded solely from the physical point of view, but the social and educational factor was of great value. A poor patient for the first time in his life had time to learn how to think and live and use his leisure time. The treatment of tuberculosis in children was very important. Infection occurred at a very early age, previous history could be obtained more easily, and tuberculous children were much more intelligent than others. Boarding schools for working-class children were urgently required, especially when these children were delicate. Working-class patients should return to their previous work, as in this way much of their anxiety was relieved. Means for treatment of surgical tuberculosis in adults was much needed.

Dr. HECTOR MACKENZIE said that it was impossible to decide whether any particular case of consumption was curable or not. The sanatorium was only one means for attacking the problem and was designed for hopeful cases, but there was need for permanent institutions for the incurable advanced cases and for the dying.

Dr. A. NEVIN ROBERTSON said that the sanatorium was the best method of raising resistance which we had at present. The limitations were financial, patients not having enough money to get treatment for a sufficient length of time. Of 1141 patients who had been in Benenden Sanatorium from 1907 to 1914, 36 per cent. were on full work, 3 per cent. on partial work, 11 per cent. on no work, 41 per cent. were dead, and 6 per cent. were readmitted. Of 563 cases traced at the end of 1914 who had left in the years 1907–11, 20 per cent. were on full work, 2 per cent. on partial work, 2 per cent. on no work, 63 per cent. were dead, and 12 per cent. had been readmitted. He thought the results in early cases were often permanent. Bad housing was only one factor in causing lowered resistance, which followed alcoholism, syphilis, overwork, dissipation, poverty, and lack of food. The *value* of sanatorium treatment depended upon discipline and healthy environment. For the prevention of the disease we must have thorough education of the people in the laws of health, and remove the conditions of bad environment. Early diagnosis and treatment and isolation of infective cases from beginning to end of the disease were required.

Dr. D. J. CHOWRY-MUTHU said that we must decide whether tuberculosis was a social or infectious disease. If it were an infectious disease every measure of inoculation and injection and internal administration of antiseptics would be legitimate and essential. But while believing in infection we could not consistently swing round and attack poverty, alcohol, bad housing, low wages, and other social evils. He was convinced that consumption was more a product of vicious environment than of infection. From a study of the mortality rate of phthisis in England and Wales for 40 years from 1875 to 1915 it happened that during the last 20 years (1895 to 1915), in spite of active propaganda and great efforts to destroy infection, the rate of mortality had not declined so much as in the previous 20 years when no such efforts were made. On the other hand, the fact that improved well-being of the people had been the means of reducing the mortality of phthisis was a proof that it was more a social and economic disease. The success of sanatorium treatment supported this, for the provision of fresh air, food and rest, and healthy environment had brought about cure or arrest in many cases. Its value depended among other things upon the nature of cases admitted, the duration of their stay, the discipline among the patients, and the personality of the physician. But sanatorium treatment could not prevent tuberculosis or cure every case. It was the first link and showed the patient how to live the right life. It was for the nation to devise larger and more comprehensive measures, such as farm colonies, industrial settlements, garden cities, &c., to meet the needs of both the disabled soldier and the disabled consumptive.

Dr. JOHN SORLEY thought that undue importance was attached to physical signs in classification. Early cases only were to be sent to sanatoria, but he had patients with cavities doing 70 hours per week, and patients with the disease in an early stage with a few crepitations at an apex going down hill quickly. The death-rate of those who did not avail themselves of sanatorium treatment was 84 per cent. higher than among those who did.

Lord GLENCONNER, President of the National Association for the Prevention of Consumption, said that much progress had been made, not in cure but in investigation, and in care in providing healthy surroundings for our working people. He was favourably impressed by all he had seen in sanatoria. Only the fringe of the problem was touched, but in time to come that margin would become larger.

Reviews and Notices of Books.

Lord Lister. By Sir RICKMAN JOHN GODLEE, Bart., K.C.V.O. London: Macmillan and Co. 1917. Pp. 676. Price 18*s.* net.

"A SCIENTIST'S public life lies in the work that is his" were Lister's own words in regard to the form in which posterity should think of him. And of no one could this be more truly said than of him who made modern surgery possible, who—in Professor Howard Marsh's words as Bradshaw lecturer—opened the gates of mercy on mankind. Lister's life is therefore written, from his own point of view, in the two stately volumes of Collected Papers published in 1908 by the Clarendon Press, as well as in the work of every surgeon who practises the antiseptic methods which Lister introduced. But it was, nevertheless, inevitable that a generation which no longer knows Lister in the flesh should desire some personal details of a radiant career, and the medical profession as well as a wider public owes Sir Rickman Godlee a debt of gratitude in having provided them with an authoritative biography. As Lister's nephew, who was intimately associated with him in his surgical and experimental work, Sir Rickman Godlee claims certain disabilities as a biographer, but the reader will not be inclined to admit the drawbacks, and will have no difficulty in forming his own judgment in places where the biographer modestly leaves facts to speak for themselves.

Sir Rickman Godlee's account makes it easy now to picture the qualities which enabled Lister to present his message to the world with success. Brought up in a Quaker household, and debarred from entering either of the older Universities, his youth was spent in the practical pursuit of natural history on long country walks, in reading Latin authors with his father, himself a man of no small scientific and artistic attainment, who brought up his family in the conviction that life was a gift to be employed for the honour of God and the benefit of one's neighbour. The microscope which helped to confirm Lister's arduous experimental work was itself improved in several important particulars by his father's optical studies. Lister therefore received his education in a scientific atmosphere of a nature which fitted him for independent thought. He possessed, too, those personal qualities of mind which added force to his teaching: his serenity was absolute, his courtesy unfailing, coupled with a persistence which was neither discouraged by others' neglect of his work nor unduly elated by their notice of it. When he had no other adherents he was happy in the ability to convince his own pupils of the justice of his conclusions. Lister had, too, in a remarkable degree, the courage of his convictions. He trusted his own antiseptic methods and based his practice upon them. At a time when Sir Rickman Godlee was demonstrating in anatomy at University College and expressly forbidden in consequence to enter the surgical wards of the hospital, Lister constantly employed him to assist in operations in his private practice. Qualities such as these enable a man to live down the early opposition which novel and original thought stirs up. Semmelweis, too, showed how infection from the dissecting-room could be met. He observed that the mortality in the Vienna Maternity stood at a greatly higher figure in the wards attended by students than where midwives were employed. The use of chlorinated lime to cleanse the students' hands as they came from the dissecting-room to the women's clinic at once reduced this mortality from 12 to 3 per cent. But Semmelweis found himself unable to impress his views on his own colleagues; his energies were wasted in eternal wrangling, and after years of ridicule and persecution his mind finally became unhinged. Lister, when he visited Budapest in 1885, found that Semmelweis had been forgotten in his own native city.

Besides the picture of Lister himself, Sir Rickman Godlee's book contains an attractive sketch of Victorian medicine at Edinburgh, at Glasgow, and in London. Lister's relations are drawn with such foreign savants as Kölliker and Pasteur. The latter, whom he had long recognised as having furnished the principles upon which alone the antiseptic system could be carried out, he did not actually meet until the year 1881. The scene is graphically described in which, ten years later at the Sorbonne, Lister delivered an oration at the great gathering called to honour the illustrious Frenchman in whose steps he had followed. M. Rixens's picture of the scene is well reproduced, and a number of excellent portraits of Lister and of his near relatives are given. The book is indeed all that a biography should be, and is certain of a great success.

War-shock: the Psychoneuroses in War; Psychology and Treatment. By M. D. EDER, M.R.C.S., L.R.C.P. Lond., B.Sc., late Temporary Captain, R.A.M.C. London: William Heinemann. 1917. Pp. 154. Price 5*s.* net.

THE author was in Malta for many months and has recorded in this book the first hundred consecutive cases of psychoneurosis which came under his care there. From the nature of the circumstances in which he was placed he has been unable to follow up the majority of these cases, so that the reader is not provided with the ultimate result. As far as immediate results are concerned, however, Mr. Eder claims that he obtained "complete cessation of all the symptoms" by "suggestion under hypnotism," and this he calls a "cure." According to his figures the percentage of "cures" thus obtained was most gratifying, and Mr. Eder may be congratulated on the excellence of his results.

Mr. Eder avows himself a follower of Freud and adopts his classification of conversion-hysteria and anxiety-hysteria. He does not use the term neurasthenia, for the reason that he is "unable to find, at any rate in the troubles produced in the war, any clinical entity that corresponds to this term." Neurasthenia has not infrequently suffered dismemberment before this, but as far as we are aware it has never been pruned away to nothing, and we can only suppose Mr. Eder's experience to be unusual. We should add, in fairness, that Mr. Eder regards neurasthenia as the clinical picture, as his master Freud declares, "corresponding to the specific cause of excessive masturbation or frequent pollutions." If this is what the Freudian understands by neurasthenia, it is perhaps not surprising that in the midst of modern warfare Mr. Eder has not come across the condition. In other ways the reader will find material for discussion in these pages, which run along well-marked Freudian lines.

Occasionally in Freudian literature we get the impression of a certain slight air of condescension on the part of the enthusiast in referring to other methods of treatment than his own. While Mr. Eder regards suggestion under hypnotism as the method of election for war-shock in the soldier, he allows himself to say that electrotherapy, massage, and Weir-Mitchell treatment have a "savour of charlatanism." He cannot, however, be ignorant of the fact that results as good as, or even better than, his own have been obtained by the methods he thus alludes to, and this, too, in many instances where hypnotism has failed. He probably knows that, according to the latest opinion of French observers, in exactly the same class of case as has come under his care, "suggestion under hypnotism should be definitely abandoned." The categorical statement is made by Mr. Eder that "the faradic current should not be used in the hysterical mutism of soldiers." Those who have employed it with success in cases that have been hypnotised without result will probably smile at Mr. Eder's veto. In his introductory chapter Mr. Eder refers to "reflex paralysis" as a "new disease" which Oppenheim has described (we owe it, however, to Babinski), and says this new disease "seems but due to his (Oppenheim's) ignorance of contemporary psycho-pathological work." Unfortunately the statement seems but due to Mr. Eder's ignorance of contemporary neurological work.

Encyclopædia Medica. Second edition. Vol. V.: Filix Mas to Heart. London and Edinburgh: W. Green and Son, Limited. 1917. Pp. 766. Price 20*s.* net.

THIS instalment of the great work which Dr. J. W. Ballantyne is editing keeps up the standard of the previous volumes. All the articles which have appeared before have been revised or rewritten, and new articles appear on First Aid, by Dr. H. L. Watson Wemyss; on the Development, Anatomy, and Physiology of the Fœtus, and on Diagnosis in Gynæcology, by the editor; and on Graphic Methods in Examination of the Heart, by Dr. G. Douglas Mathewson. The whole section on the heart occupies 200 pages, and forms an up-to-date summary of cardiac medicine and surgery. There are a few useful coloured plates and a number of illustrations in the text.

Recurrent Fever
SYPHILIS

GALYL

Frambœsia
Sleeping Sickness

3000 Injections (intravenous) were given in one of our **Service Hospitals.**

"No case has given the slightest cause for anxiety, and the clinical results are very satisfactory."
Staff Surgeon's Report.

GALYL is as effective as SALVARSAN or NEOSALVARSAN on Spirochætes and Trypanosomes, more rapid in action, and free from the neurotropic and congestive action of these preparations.

FOR INTRAVENOUS INJECTIONS:—
(1) **DILUTE.**—GALYL is supplied in neutral glass ampoules containing the necessary dose of Sodium Carbonate, sterile distilled water only being used for the dissolution.

(2) **CONCENTRATED.**—A special outfit containing one dose GALYL, one ampoule sterilised solution, and one small filter is supplied.
DOSES.
0·10—0·15—0·20—0·25—0·30—0·35—0·40.

(3) FOR INTRAMUSCULAR INJECTIONS:—
GALYL is supplied in **GLUCOSE SOLUTION.**
DOSES.
0·10—0·15—0·20—0·30—0·40.

THE IMPROVED INTRAMUSCULAR INJECTION.

A STABLE SOLUTION *NOT* an Emulsion.

The GALYL is in the form of a Sodium Salt in a weak solution of Glucose. This is much easier to use and more rapidly absorbed than the oily emulsion. It is in every way identical with the intravenous — efficacy, dose, price, &c., only differing in administration.

Thorough and exhaustive tests in various parts of the Kingdom have proved it to be equal in every way with the intravenous; moreover, patients may resume and continue their occupations without inconvenience after injection of Intramuscular GALYL.

LATAPIE
SERO-REACTION FOR SYPHILIS

Simplified Wassermann Test of the Pasteur Institute.

The Latapie process, which only requires **three** test-tubes, has marked advantages over other methods; it simplifies the technique and makes errors almost impossible.

This statement is based upon extensive practical experience embracing more than 100,000 examinations conducted at the Pasteur Institute with blood collected at the Institute itself or sent in from outside sources.

Accurate—Reliable—Uncomplicated—Economical.

The Antigen is supplied in tubes, which is diluted 22-26 times (according to indications on each tube).

It keeps good and fully active for several years if kept at room temperature and protected from light.

Full and Complete Instructions with each Tube.

The Numerical Position of the Medical Student.

To the General Council of Medical Education and Registration, which commenced its winter sitting on Tuesday last, Sir DONALD MACALISTER, the President, in the course of his address from the chair, made a valuable pronouncement with regard to the numerical position of the medical student. It is, of course, well known that the loss to the medical schools of students who had necessarily joined the Navy and Army deprived the country of men who would in other circumstances have been added to the Medical Register as new practitioners, especially during next year and 1919. We have frequently pointed out that much difference of opinion was manifested at the commencement of the war as to the advisability of using medical students for combatant service, but optimism dictated a policy which, whatever we may think now, had its origin in sound and patriotic reasons. While everybody could see that if all the potential medical men in the country went on combatant service there would sooner or later be a shortage of practitioners, few believed that the effects of the shortage would actually be felt during the war, seeing that few put the duration of hostilities at a longer period than, say, three years. On the other hand, all who thought about the matter at all—and, unfortunately, they were not many in number, even of the medical profession—felt that even a war of two years' duration, if it shut off all recruits from the medical profession, would have an evil outcome. As the medical profession is wanted with equal urgency for civilian and military purposes, and as no medical curriculum can occupy less than five or six years, it was seen by the more provident that while hostilities continued we should get nearer the point when there would be a dangerous diminution in the ranks of medical practitioners.

Sir DONALD MACALISTER, in putting the situation before the highest authorities, has been able to support his words with statistics; and the figures, as he announced them to the General Medical Council, show that in January, 1917, only 572 men and 261 women were in the third year of their medical studies, and could therefore be counted upon as probable accessions to the Medical Register of 1919. This would mean a shortage from the normal of nearly 300 practitioners. The Army Council, on the position being made known to them, directed that students registered prior to August 1st, 1914, who had before enlistment completed two years of the curriculum—i.e., who were students in their third year at least—should be passed out of combatant service to resume medical study. In order to determine the effect of this concession, as well as to dictate further policy, the Minister of National Service has since asked for a census of medical students actually in attendance at the opening of the present session. Accordingly, in October forms were sent out by the Registrar of the General Medical Council to be returned on Nov. 14th, and the figures, so far as they go, are those given to the Council by the President (see page 834). The figures, it will be seen, show that students in their first and second years were largely under 18 years of age in October, 1917. They were accordingly outside the influence of conscription for combatant service; and this fact, of course, is not without significance. Students in their third year in October, 1917, had increased in number, suggesting that the Instruction of the Army Council, quoted above, has had some effect, but the proportionate increase among female students is far larger than it is among male students. Fourth-year male students numbered 709 and females 194, upon which figures Sir DONALD MACALISTER comments with the simple statement that unless all students of this standing are returned from military duties, the supply of new qualified men cannot be maintained in 1919. As, however, the Ministry of National Service has agreed to maintain, if possible, the supply of medical students at a level which should ensure the annual addition of at least 1000 medical practitioners to the Register, it will be necessary to modify the scope of the existing Instruction of the Army Council. Without such modification Sir AUCKLAND GEDDES'S Department cannot keep its provisional promise. This probably is the fact which gave rise not long ago to a statement in a lay paper that all the medical students who were serving in combatant positions in the Army would shortly be demobilised and sent back to their medical schools. No such sweeping policy is possible at the moment. The present Instruction is that students who had begun their curriculum prior to August 1st, 1914, and had at the time of enlistment completed two years' course, may claim to be returned to their studies. It is this Instruction which will probably have to be bettered, similar facilities for taking up their medical curriculum being extended to second-year students.

Sir DONALD MACALISTER referred also to the position in the Royal Navy in connexion with medical students, for with regard to this Service, so far from being able to expect an increase in the number of students who can be relieved from combatant duties and returned to the medical schools, the call is for senior students, who are wanted to discharge medical functions. Third-year students who have passed the examination in anatomy and physiology are able to serve as surgeon probationers in certain capacities in the Navy, and to withhold such young men from the work would only be to make the demand for qualified medical men, already so hard to meet, still more acute. But from Sir DONALD MACALISTER we learn with pleasure that the period of service of these junior officers is only to be six months, and that those six months will count

as part of their curriculum, and will therefore not delay their ultimate qualification. More, their term of work with the Navy may afford them experience that will later be of great value in practice.

The Surgical Complications of the Enteric Fevers.

THE manifestations of enteric fever are for the most part of medical interest, and it is comparatively rarely that the surgeon is called upon to intervene in the treatment; but the wide experience of this disease which the course of time has given us has shown that in every large epidemic there are some cases requiring surgical treatment, and the lecture by Lieutenant-Colonel A. E. WEBB-JOHNSON, reported in the present issue of THE LANCET, gives a lucid account of these surgical complications. The discovery within recent years that enteric, which was only separated from other continued fevers after many years of careful observation, was not one disease, but rather a collection of three diseases resulting from the activities of a group of closely allied organisms, is, of course, of much more medical than surgical importance, but even in connexion with surgery it is not without significance. With regard to general severity and mortality we have learned that the differentiation of the diseases of the enteric group has shown that the paratyphoid forms are of decidedly less severity than the true typhoid form, and it may also be said with certainty that, so far as the surgeon is concerned, there is much less frequency of the need for surgical treatment in paratyphoid than in typhoid itself.

Perforation of the bowel is probably the most important surgical complication, and statistics show that it occurs with decidedly less frequency in the paratyphoid group. Equally remarkable is the influence of inoculation. In those who have not been inoculated perforation occurs with more than six times the frequency which we expect to meet with among the inoculated. Here there is a curious point: in paratyphoid the ulceration tends to involve the large intestine to a much greater extent than in the other form, and that will doubtless account for the fact that in paratyphoid a large percentage of the perforations occur in the large intestine. It is no easy matter to detect perforation; it occurs most commonly during the period when generally the patient is in a semi-conscious condition, so that signs of pain may be entirely absent, and the only indication may be sudden collapse. As to the treatment of perforation there cannot be two opinions. Although the patient is probably not in a condition to invite operation, yet there can be no doubt that to open the abdomen immediately is the only possible course. It is true that patients have survived undoubted perforation without an operation, but the probability of this occurrence in any individual case is extremely small. Still, now and then restrictive peritoneal adhesions may form and wall off the perforated bowel. Unfortunately, the statistics of operation for intestinal perforation are not good, but many cases have been saved, and the hope of the future lies in earlier diagnosis, followed by immediate operation. There is undoubtedly a great risk that the typhoid group of bacilli may attack the liver or the bile-ducts, and as in the enteric fevers the liver has to strain the blood of the portal vein and to separate from it the infective micro-organisms, it is not strange that these germs in their course along the bile-ducts should sometimes attack the walls of the channel, and so give rise to one form or other of inflammation. Cholecystitis is the most important of these and the skill of the surgeon may be invoked to deal with it. The formation of gall-stones has always been somewhat of a mystery, but there is much evidence that micro-organisms have a share in their production, and we may regard it as proved that the typhoid bacilli are in no little degree responsible for the formation of many biliary calculi.

That thrombosis may occur in typhoid is well known, and citrates have often been given internally for its treatment, but Colonel WEBB-JOHNSON tells us that Captain H. F. MARRIS has had wonderful results with the intravenous injection of a weak solution of sodium citrate in normal saline. Bacilluria is common in this group of diseases, and therefore it is not strange that affections of the genito-urinary tract are sometimes seen in the course of typhoid and its allies; and, further, Colonel WEBB-JOHNSON, suggesting that the bacilli may be responsible for some of the cases of urinary stone, urges that urinary calculi should always be examined bacteriologically. The affection of one or both parotid glands is, without doubt, due to the passage of the typhoid organisms through the duct of Stenson; the condition is severe, but as it occurs mainly in those who are in a very low condition it is rather as an indication of the general weakness of the patient that the affection specially deserves notice. The typhoid diseases of joints and of bones, and especially of the spine, are often of serious moment, and the prompt recognition of their nature is highly valuable for treatment. It will thus be evident that the surgical importance of complications of typhoid is great, and that the surgeon is able to give aid in directions that were quite undreamt of by the therapeutists of a few years ago. This is the sort of position that spells progress, which is always indicated when a pathological condition passes from a distinctly surgical or medical sphere into one for common consideration.

THE Third Annual Report of the Medical Research Committee, which has just appeared, is a record of work which is not merely of immediate importance to the naval and military forces, but which, by throwing new light on a number of medical problems, is likely to modify profoundly practice in the future. The Committee welcomes the growing trust in the value of research evinced by the public, and appeals for an increase in the funds available for rapid and effective research work.

Annotations.

"Ne quid nimis."

DR. JAMESON.

Sir Leander Starr Jameson, known to the end of his stirring career as Dr. Jameson, although all the activities which earned him a place in national history were independent of his original career of medicine, died on Nov. 26th at the age of 64, to the deep regret not only of his large circle of personal friends but of the public at large, including that section which during the most prominent part of his life was violently opposed to his policy. The development of South Africa was his life-work, but his early training for a profession which demands accurate observation, strenuous application, and a keen interest in human nature, counted for much of his success in political administration, and in his ability to make a decision and to take a broad-minded view of opponents. Thus it was that his enemies became his friends. Born in Edinburgh in 1853 he was a successful student at University College Hospital, and after qualifying in 1875 as a Member of the Royal College of Surgeons of England and graduating M.B., B.S. at the University of London, he won the gold medal for medical jurisprudence. He obtained the M.D. two years later, and showed every promise of becoming a prominent member of his chosen profession, but his health failing he went to Kimberley, where, in 1878, he entered into medical partnership. His skill and a charm of manner which was operative because it arose out of a natural simplicity and was clearly not assumed with any desire to please, attracted to him British and Dutch patients, and in course of time he met Cecil Rhodes, whose influence dominated his after-life, so that the two names must always be associated in the wonderful developments which have followed British rule in South Africa. On the invitation of Rhodes, in 1888 Jameson undertook a mission to Lobengula, whose gratitude he gained by curing the great chief of gout, thus repeating the course of events which often took place during the spread of British rule in India, when the medical officers of John Company proved over and over again their value as imperial agents. From 1891 to 1895 he acted as Administrator of Rhodesia, and was decorated for his services. The story of his connexion with the South African war, including the celebrated raid and the subsequent trial, need not be dwelt on here, for it is all history; but it was characteristic of Jameson that he never denied his principal responsibility for what happened. During the war, when he was besieged in Ladysmith, he contracted typhoid from his own servant whom he was nursing, and his health in England, while the events of the raid were the subject of trial, and while he was serving the first six months of his sentence, was more than a little anxious. Complete recovery, however, ensued, and he returned to South Africa, and was elected a member of the Cape Legislative Assembly in 1900, becoming, in 1904, Prime Minister for Cape Colony, two years after the death of Rhodes. This position he held for four years. He was made a Privy Councillor in 1907 and a baronet in 1911, and a year later, owing to ill-health, resigned his seat in the Union Parliament and returned to England, succeeding the late Duke of Abercorn as president of the British South Africa Company. Continued ill-health prevented him from taking a very active part in public affairs during later y but as chairman of the Central Prisoners War mittee and as the organiser of private hos abroad he continued to the very end to mai his reputation for strenuous labour in the cau the British Empire. The medical professio every reason to be proud of having supplied t nation, in the person of Dr. Jameson, a citizen and patriot.

ELECTRICALLY HEATED BEDS.

A WARM bed is the most important matte a patient suffering from pneumonia—Sir Duckworth quotes[1] Sir William Gull as sa And in view of the elaborate care with which details of sick nursing have been worked out more than a little curious that the maintenan the patient's warmth in bed should have bee so long to the precarious ministry of the hot-v bottle. If the aim is to maintain an even tem ture it is obvious that any system of intermi heating is very unsuitable for the purpose. W has a high specific heat which, when contained badly conducting envelope, it parts with slowly at best with the rubber bottle the bed tempera is a constantly fluctuating quantity. Various ef have been made to solve the problem by the use continuous electric current passed through suit resistance, but these have failed for the most in not providing for the wear and tear insepa from bed-using and bed-making. A successful tion has now been reached by Mr. H. J. Gauva the Treloar Cripples' Hospital, Alton, where wards are now supplied with electric mattre which have proved both safe and convenien practice even when a child is the occupant of bed. The mattress does not differ in appearance any other except that a flexible wire enters it a head end through a terminal which is flush wit surface and therefore not exposed to injury. resistance wire is insulated by glass bead flexible metallic tubing incorporated in the stance of the mattress. The mattress is different heated and the heating element is so disposed the maximum warmth is generated at the foot less in the middle, and none at all at the head This distribution of heat is maintained in what position the mattress is turned, either from he foot or side to side. The wires are connected a switchboard on the wall at the head of a which contains a variable resistance, so that current can be graduated to any required exten is so arranged that when the current is full o temperature of the bed is raised 25° to 30° F. a that which would obtain apart from the heating this has been found in practice to meet the nee the small cripples, many of whom are fastene splints which do not allow of the close conta the bedclothes. A fuse prevents the passage o current exceeding this amount. Several of usual difficulties have thus been met: the tem ture of the mattress cannot rise to any dang degree, the tubing is so flexible that the mat can be shaken or rolled up, and the resistance is waterproof in the spiral metallic tubing, so no short-circuiting results, even if the mattr wetted. The mattress may be sterilised in ordinary way. The system is equally appli whether the bed be in or out of doors. saving of time at the Cripples' Hospital am to an aggregate of three hours a day in ward where the electric mattress has rep

[1] Some Clinical Aphorisms. London: Spottiswoode, Ball and Co., Limited.

the filling of hot-water bottles, while inasmuch as the current required for maximum heating is only half an ampère at 110 volts, the total expenditure of energy for 200 or more beds would be by no means prohibitive. We believe that the general adoption of a similar appliance in hospitals and infirmaries would save much time and relieve the nursing staff of a tiresome routine. Electrically heated beds have already been found of advantage in the treatment of shock at field hospitals, and for military purposes it will be seen that the current required may be instantly supplied from a portable dynamo driven by a motor lorry or car attached to a field hospital. This is of especial importance in circumstances where water for hot-water bottles is not readily available and the means of heating the water required is limited.

THE DEATH OF DR. ELSIE M. INGLIS.

WE deeply regret to record the death, in her fifty-third year, of Dr. Elsie M. Inglis at the English port whither she had just returned from Rumania. Born in India, educated at Hobart and Edinburgh, she was, when war broke out, joint surgeon and gynæcologist to the Edinburgh Hospital for Women and Children, but gave up her post to organise, with indomitable spirit, the Scottish Women's Hospital Units, which have relieved untold misery in France, Serbia, Corsica, Salonica, Rumania, and Russia. Her wonderful work is a story of medical administration under circumstances of supreme difficulty, and when it comes to be told in full she will be recognised by all as one of the bravest among the many heroines and heroes whom the world catastrophe has called from private life to glorious patriotic endeavour.

THE TRANSMISSION OF PLAGUE BY BED-BUGS.

THE possibility of the transmission of plague by bed-bugs has long been recognised by experts. There is also no doubt that these insects can give rise indirectly to the disease, as, for example, when a bug has fed on a human case of septicæmic plague and has afterwards been intentionally or accidentally squashed; the contents of its stomach containing the *Bacillus pestis* may, through an abrasion of the skin of the person touching the squashed insect or its stomach contents, infect that individual. Some interesting experiments and observations upon the subject have lately been carried out by Lieutenant-Colonel J. W. Cornwall, I.M.S., and Assistant Surgeon T. Kesava Menon, I.M.S., of the Pasteur Institute of Southern India, Coonoor, and published in a recent number of the *Indian Journal of Medical Research*. These investigators held the opinion that there was no reason why bugs should not infect themselves from human beings suffering from septicæmic plague, and that if these insects ever feed upon rats or mice they could equally well infect themselves from these animals. During the inquiry it was found that while some bugs allowed to feed on a septicæmic plague case die in a few days from the infection, others may survive as long as 38 days and the plague bacillus may be recovered from their stomachs by culture at the end of that time. Bugs, therefore, which have fed on a patient with septicæmic plague are to be regarded as a potential source of danger. The experiments showed, too, that bed-bugs cannot regurgitate, like the fleas, the contents of their stomachs in the act of feeding; so that if they ever transmit plague by biting, they must do so by washing out with their saliva the plague bacilli which may have been stranded in their sucking tube. But these bacilli are not likely to remain in the sucking tube for long after an infected feed. It cannot, then, be said for certain as yet whether bugs can, or cannot, transmit plague by biting. It is satisfactory, however, to find that the conclusion arrived at by the above-mentioned investigators is to the effect that there is small likelihood that human plague is transmitted by bugs biting under natural conditions.

THE MUNITION WORKERS' FOOD.

THE Health of Munition Workers Committee has submitted a report prepared by Dr. Leonard E. Hill, F.R.S., on a thorough inquiry into workers' food, together with some suggestions as to dietary. Captain M. Greenwood, R.A.M.C., helped in the investigation, and the Committee consider that the new material now presented is likely to prove of substantial value in connexion with practical problems. In the introductory paragraphs of the report a general survey is given of the body's necessities in regard to food. The results of the inquiry follow. In order to determine the kinds of dietaries provided for munition workers specimen meals were obtained, by personal visit or otherwise, from a number of canteens attached to munition works and, to serve as a contrast, from other sources as well. The amounts of protein, fat, and carbohydrate were estimated and the calorie value calculated. The investigation was thus carried out on the actual conditions of practice. The results obtained showed that the average canteen dinner is a good one, containing, as it should, an energy value of about 1000 calories, well distributed among the amounts of protein, fat, and carbohydrate. Apart from calorie value, an inspection of the dinners showed that meat, vegetables, and puddings were made of good materials and well cooked. For the relief of monotony, which is pointed out as an important factor in connexion with industrial canteens, a change of surroundings during the meal and a short walk before partaking it are held to be desirable. On this account, and also on account of the importance of ventilating the workshops so that the air may be fresh when the workers return, it is recommended that the custom of eating meals within the workshops should be discontinued, and that all food should be taken either in a canteen or restaurant, in the open air, or, at least, away from the ordinary place of work. The next subject investigated was the nature and energy value of meals brought by workers from their own homes. The workers from whom meals for analysis were obtained were not asked beforehand to bring a sample meal, but were interrogated at the entrance gate, and asked to exchange the contents of their dinner basket for a sum ample to buy a meal at the canteen. The results showed that a meal of rabbit and vegetables in a basin brought from home by a man on night shift, gave a total energy value of 683·4 calories. In another instance the meal, consisting of sausage roll, bread and butter, and ham and cheese, gave 1448 calories; while a meal brought from home by a boy, consisting of a dish of potatoes, tomatoes, and bacon, jam puff, a cake, bread, butter and jam, equalled 1719 calories value. As is pointed out, the boy's meal with its 1719 calories as contrasted with the 1346 of the canteen meal or with the 1448 of the man, illustrates the effect of growth and work in pro-

ducing appetite, but even so, the variations are probably excessive. The dietaries of women workers were next examined, when the results varied. In the case of one restaurant the meal was a sensible one and supplied at small cost. In another restaurant was found an example of "the unsatisfying meals which pale-faced young women may often be seen consuming in popular cafés." Recommendations are made to bring the canteen meal for women workers up to between 500 and 700 calories value. It was found that the food brought from home by girls varied greatly in nutritive value—namely, from 295 to 1143 calories. While the latter is sufficient without anything from the canteen, the former is not regarded as enough even if a double helping of pudding were added. The dietaries provided at the hostels, required on account of the inadequacy of pre-existing accommodation for housing the suddenly increased personnel of certain large munition factories, showed that the requirements of factory workers were met, unless very heavy work is being done. In some cases the calorie values might be reduced, as when there are facilities for getting extra food for those who want more. A useful table is given setting out the energy values of foods which may replace, or be substituted for, the foods contained in the ordinary dietaries. The report is a valuable one and eminently practical in character. It is pointed out that the nation is working harder than before the war. There are 4½ million women now at work, and elderly men have come back to occupation. Many children are also working, and all round the nation's need for food has considerably increased. One important conclusion in the report will receive general endorsement; it is that the immediate remedy for a threatened scarcity lies not in a reduction of food needed for the performance of work, but in a saving of all waste, a complete utilisation of all food fit for human consumption, an increase in the home production of food, and so an extension of the food-supply. Dr. Benjamin Moore, F.R.S., gave valuable assistance in the inquiry and Mr. A. Webster carried out numerous analyses.

MEASLES CONSIDERED AS A RESPIRATORY DISEASE.

IN later numbers of the *Military Surgeon* (Washington, D.C., U.S.A.) Lieutenant-Colonel E. L. Munson completes his case for regarding measles from a military point of view as a respiratory disease with a rash as a sequela. He bases his view on the story[1] of an outbreak of 443 cases of measles which occurred last spring at Camp Wilson, San Antonio, Texas, in a division of 13,773 men. 136 cases per 1000 occurred among the 2400 men of two regiments who neglected the prophylactic measures he prescribed for them, while the 11,000 men who obeyed had only 10 cases per 1000. Colonel Munson directed his measures of prophylaxis as against an acute respiratory disorder, infectious during the four days following invasion and with an incubation-period of 10 to 14 days. In January there were already in camp many cases of respiratory disease, bronchitis and the like. To prevent these he ordered better ventilation of tents, and the sunning and airing of bedding. In those regiments which carried out these divisional orders respiratory disease fell to a minimum, and when the measles infection, which had been threatening the camp from San Antonio, actu arrived, it had the less chance to spread, pa cularly as all cases of catarrh with pyrexia, th that complained as well as those that were covered by search, were isolated till the rash appea (98 cases) or until, after four days, it was evic they were not cases of measles. When a case diagnosed as measles all the other men of that were sent to the quarantine camp with their t bedding, and other belongings for disinfection isolation; 74 cases did actually appear among th contacts. Regiments which carried out these orc escaped the epidemic. A great deal, Colonel Mun contends, depends on the personality of the c manding officer. He cites as an instance an artil unit which on Jan. 16th had a sick rate of 7·9 cent. On the 17th its colonel returned from months' leave. He at once insisted that sani regulations were enforced as prescribed, and in weeks' time his unit's sick list was reduced one-fifth, or 1·5 per cent., while in the same pe the sickness-rate in the careless regiments trebled. In the latter the captains of unheal companies were noted to be officers of little milit credit. In fact, the whole history of this epide enforces the conclusion of the reporter—that health of an army is a function and a test of military discipline. Colonel Munson's report sho be read by all military medical officers and may of help to sanitary authorities in the managem of measles epidemics.

[1] THE LANCET, 1917, ii., 88.

THE METROPOLITAN WATER-SUPPLY.

THERE were fluctuations in rainfall over Thames basin during the three months J August, and September, the fall being 1·93 of inch above the average mean rainfall during previous 34 years in July, 3·18 inches in Aug and 0·08 of an inch in September. In July results of the chemical examination showed all three raw river waters improved in quality, in August, with a comparatively big rainfall, th was a general deterioration in chemical qua while matters improved again in Septem Bacteriological results in July showed that raw waters contained fewer bacteria than th respective averages for the year 1916, and the s result is reported for August and September. filtered waters in all three months gave, gener speaking, not unsatisfactory results. In J whereas 99·9, 77·1, and 63·6 of the samples of Thames, Lee, and New River water respecti contained typical *B. coli* in one cubic centimetr water, 78·1, 72·7, and 84·5 per cent. of the filte water samples derived from the Thames, Lee, New River respectively contained no typical *B.* in 100 times as much water examined. In Aug 99·8, 100·0, and 80·9 per cent. of the samples of Thames, Lee, and New River water respecti contained typical *B. coli* in one cubic centimetr water, while 60·8, 66·7, and 61·9 per cent. of filtered water samples respectively from Thames, Lee, and New River contained *B. coli* in 100 cubic centimetres of the water. September, whereas 95·0, 89·4, and 40 per cent. of samples of raw river waters contained typical in one cubic centimetre examined, 68·3, 60·0, 80 per cent. of the filtered waters contained typical *B. coli* in 100 times as much water examin The importance of the efficiency of the filtrat and other purifying processes at our great wa works is again illustrated, and the result i practically sterile supply.

THE GENERAL COUNCIL OF MEDICAL EDUCATION AND REGISTRATION.

—o—

TUESDAY, NOV. 27TH.

THE General Medical Council commenced its winter session at its offices, Hallam-street, W., Sir DONALD MACALISTER, the President, being in the chair.

New Members.

The following new members took their seats: Mr. MEREDITH TOWNSEND, M.R.C.S., L.S.A. (as representative of the Society of Apothecaries of London for one year), and Lieutenant-Colonel HARRY GILBERT BARLING, C.B., F.R.C.S. (as representative of the University of Birmingham for five years).

Presidential Address.

Sir DONALD MACALISTER commenced his address by regretting the resignation from the Council of Dr. Robert Saundby, whose place had been taken by Lieutenant-Colonel Gilbert Barling, and of Dr. George Wilks, who had been succeeded by Mr. Meredith Townsend; and by expressing sympathy with Dr. John McVail, the present Crown member for Scotland, on the death of his distinguished brother, Sir David C. McVail, who five years ago had occupied the same position on the Council for 20 years. He then pointed out that the medical duties of the Army Recruiting Department had now been transferred to the Minister of National Service, where the new Minister, Sir Auckland Geddes, himself a medical practitioner, was assisted by a Medical Advisory Board. The Ministry further, through coöperation with the Statutory Professional Committees in England and Scotland, came into connexion with the Local Medical War Committees, so that an organisation, he said, now existed which was designed to meet fairly the distribution of medical service between military and civilian needs. He continued:—

In several of my addresses since the war began, I have expressed the conviction that the withdrawal of students from the medical schools for combatant service would deprive the country of the necessary quota of new practitioners in the years 1918 and 1919. I have continued to press this conviction on the authorities, and have been enabled to support my view by the aid of statistics courteously furnished for the information of your Emergency Committee and of the Government by the Deans of medical faculties and schools. You will remember that in January, 1917, a census of students actually engaged in professional study showed that in the third year of the curriculum we could count only on 572 men and 261 women to provide in 1919 for the necessary accession of new practitioners to the Register. In normal times this accession should number about 1100. Only by returning third-year students then on active service could the deficiency be made good. In September the Army Council, by an instruction subsequently amended in one point, directed that students registered prior to August 1st, 1914, who had before enlistment completed two years of the curriculum, should be passed out of combatant service to resume medical study and proceed to qualification.

In order to determine the effect of this instruction, and to provide data for further action if necessary, the Minister of National Service requested that a fresh census of medical students in actual attendance during October, 1917, should be taken. The forms sent out by the Registrar were returnable on Nov. 14th, and nearly all have now been received. So far as they go they show the following aggregate results, as compared with those of January, 1917:—

1917		Men.	Women.	Total.
First-year students...	Jan.	1449	674	2123
	Oct.	*1386*	*764*	*2150*
Second-year students	Jan.	987	472	1459
	Oct.	*871*	*642*	*1513*
Third-year students...	Jan.	572	261	833
	Oct.	*805*	*482*	*1287*
Fourth-year students	Jan.	851	164	1015
	Oct.	*709*	*194*	*903*
Final-year students...	Jan.	1088	164	1252
	Oct.	*995*	*200*	*1195*

Of the men students of the first and second years over 820 were under 18 years of age in October, 1917, and about 180 are from places outside the United Kingdom. The third-year men students (who last year numbered some 520) have increased by about 230, and the women students by about 220. The fourth-year men numbered 709 and the women 194. Unless therefore all students of this standing are returned from service with the Navy or the Army, the supply of new men, duly qualified for the medical service of the country, cannot be maintained in 1919.

In the meantime the Minister has declared his intention to provide, if possible, that the supply of students in training shall be maintained at a level sufficient to ensure the annual accession of at least 1000 new medical practitioners to the Register. To effect this purpose it will almost certainly be necessary to extend the scope of the Army Council's instruction of September, either by relaxing its restriction to students registered prior to August 1st, 1914, or by including second-year students who on enlistment were sufficiently advanced in their studies to compass the Second Professional Examination within a few months.

On the other hand, the Admiralty makes an urgent demand for capable third-year students who have passed the professional examination in anatomy and physiology, and are able to render aid as surgeon probationers in the minor units of the Navy. To withhold these from their studies for an indefinite period of service would unduly postpone the date of their full qualification as practitioners, and would proportionately diminish the number annually added to the Register. The Medical Director-General of the Navy has accordingly arranged with the Ministry of National Service that the period of service of surgeon probationers shall not be longer than six months at home or 12 months abroad. The functions of a surgeon probationer being comparable with those of a surgical dresser or student assistant in surgical wards, licensing bodies generally have agreed to accept his surgical service afloat as equivalent to six months of the hospital attendance prescribed for the *minimum* curriculum. The Admiralty arrangement should therefore ensure that most of the surgeon probationers will return and qualify within the normal period; and in the meanwhile they will have gained experience relevant to their profession, which may hereafter stand to their advantage as practitioners.

The claims of the Army for fresh drafts from the civilian members of the medical profession continue, though it has become a serious problem how the claims are to be met. A War Office Committee, which included members of the Medical Council, visited the Western front during the summer for the purpose of discovering what economies in personnel, if any, might be made in the Medical Corps. Its report is not yet issued; but it is questionable whether any practicable economy can be commensurate with the continuous wastage due to the incidents of warfare. The devotion and success of the Medical Corps in preserving and restoring the health of our troops have been recognised in the warmest terms by the highest authorities; but the service is rendered at a heavy cost in sacrifice. The Registrar informs me that on almost every page of the Medical Register he has had some military distinction to insert. But too often, after making the insertion he has had to remove the bearer's name as having "died on service." In the three years 1911–13, the average number of names annually removed from the Register "on evidence of death" was 620. In the year 1916 the number rose to 983. In the current year it will probably not be less.

The welcome coöperation of the United States of America, in sending over medical units in advance of its troops, has afforded the Allies some relief in this respect. Officers of the American Medical Service have accepted honorary or other temporary positions in hospitals at home and abroad, and have thus released British officers and practitioners for other work. But we shall not be able to count on this help after the arrival in Europe of the American forces in full strength. And, again, we cannot count on American civilian practitioners to furnish many accessions to our Register. In the absence of American Federation legislation authorising professional reciprocity between the United States and Britain, His Majesty in Council is debarred from applying the Medical Act, 1886, to the United States, and this Council has accordingly no power to admit American medical practitioners to the Register unless they pass a recognised examination in medicine, surgery, and midwifery, and so acquire a professional title registrable in this country. Where such legislation, within or without the Empire, has been accomplished, the Council has not failed to give it effect. Already the Foreign and Colonial List of the Register include over 1000 practitioners, and their legal status in regard to practice is the same as our own.

Sir DONALD MACALISTER then alluded to the public advantages which have accrued from the Midwives Act for England and Scotland, which have led to a similar measure having been proposed for Ireland; and to the working of the Venereal Diseases Act, 1917, which is now operative in some 40 English counties and boroughs. He mentioned that a Dental Service Committee, with a Subcommittee for Scotland, had now been set up to regulate the calls on the dental profession, both military and civilian, and referred at some length to the Special Committee appointed by the Lord President of the Privy Council to enquire into the questions raised by the Council's recent memorandum on the Dentists Act. The wide terms of reference of this committee include an investigation into the causes of the shortage of qualified dentists, the expediency of prohibiting unqualified dental practice, and the practicability of lessening, without impairment of efficiency, the time and the fees that have now to be expended to secure qualification. On these points, he said, his evidence and that of Sir Bertram Windle, and Mr. Harper, the Council's solicitor, had been received in a manner which sufficiently showed that the Special Committee was alive to the importance of the questions involved. After alluding to the modifications in the British Pharmacopœia which had been made in order to reduce the consumption of sugar and glycerine, he continued:—

In August the English Board of Education published a scheme which has long been under consideration, for the establishment of a Secondary Schools Examination Council. It will include representatives of the English Universities and of the managers and teachers of State-aided schools throughout the country. It is designed to supervise the working of a system of leaving certificates for pupils under instruction in schools providing secondary education analogous to the system in operation in Scotland. The certificates are to be of two grades, one suitable for pupils of 16, and qualifying, if obtained "with credit," for admission to universities; and another, suitable for pupils of 18 who have undergone a full secondary course. In each grade the syllabus of instruction at the school, and the school record of the pupil, will be taken into account. When the scheme comes into effect it should practically solve the difficulties of the Council in regard to preliminary examinations, and by a method of which the Council has more than once expressed its hearty approval. At my request Dr. Norman Moore and Sir Francis Champneys have represented the Council in conference on the new arrangements with Mr. Fisher, the President of the Board of Education.

nd I desire to thank them in your name for their efficient service.
understand from Dr. Mackay that a report will be offered by he Education Committee on this important subject You will probably gree that it would be proper to await the actual introduction of the ew scheme before resuming our discussion of the present system of ultiple preliminary examinations. The proposed leaving certificate ay, and I trust it will, supersede these examinations in England ltogether, and afford a single guarantee of sound general education hich the Council may safely accept as qualifying for entrance on a rofessional course in this country.

Sir DONALD MACALISTER also called attention to the easons for believing that the present shortage of medical ien had induced unqualified persons to assume professional itles or personate qualified practitioners, in which cases he aid the Registrar was ready to examine carefully the claims ade. With regard to the cases calling for judicial inquiry uring the present session, he made particular reference to regularity of medical certification. Instructions had been sued, he said, to all officials and members of National Service edical Boards that every certificate from a man's private edical attendant was to receive due consideration and e filed for preservation.

Representation of Dentists on the Council.

Mr. THOMSON moved:

That steps be taken to promote legislation to secure the election of irect Representatives of registered dentists upon the General Medical ouncil.

e pointed out that the Council had to deal not only with ental disciplinary cases, but with matters connected with ental education. Dental education was now really under he control of physicians and surgeons. Yet there were ow some 5000 registered dental practitioners. He sug- ested that the time had arrived when they might ttingly be represented on a body which exercised upreme control over their profession. The advice of ien who were actively engaged in the practice of entistry was desirable in dental disciplinary cases, because hey were likely to be more familiar with the difficulties hich beset the honourable practice of their profession owing o the unrestricted position of unregistered practitioners. hey were also well qualified to judge both as regarded the cope and variety of subjects, and the efficiency and experi- nce required to practise their profession without detriment o the public. He was not wedded to the definite terms of is motion, but he did hope that the Council would express is approval of the general principle.

Mr. TOMES seconded, but he thought it was undesirable hat the Council should pass a resolution which very definitely aid how this dental representation was going to be accom- lished.

Sir J. W. MOORE hoped that the motion would be with- rawn. He had always regarded it as a great misfortune hat the profession of dentistry was separated from the eneral practice of medicine and surgery.

Mr. HODSDON, whilst he agreed that the representation of entists in some form or another should be given, thought a etter form of motion might be framed. He suggested that should take this form—

That it would be of advantage to the Council, in administering the entists Act, if provision were made for the appointment to the ouncil, as assessors or members, of representatives of the dental rofession.

Some members considered the employment of the phrase assessors" as liable to give rise to misapprehension. The ords "assessors or" were accordingly excised from the text f Mr. Hodsdon's suggestion, and in that form it was sub- tituted for Mr. Thomson's motion.

This substituted motion, as thus amended, was, after some iscussion, adopted.

Mr. THOMSON: I think the resolution should be sent to he Dental Committee.

The PRESIDENT: It should really be communicated to the rivy Council.

WEDNESDAY NOV. 28TH.

The Council devoted its sitting to the hearing of dis- iplinary charges against practitioners.

THE epidemic of dysentery in Prussia was sensibly iminishing (1864 cases, with 316 deaths) in the second ctober week.

APPEAL FOR THE QUEEN'S HOSPITAL FOR CHILDREN.—An appeal on behalf of the Queen's Hospital for Children, ackney-road, which is in need of £7000 for maintenance urposes by the 31st of December, has been issued by the layors of Bethnal Green, Shoreditch, Stoke Newington, ackney, and the chairman of the hospital. The institution, hich receives children up to 14 years of age, has 170 beds, nd an out-patient attendance of 180,000 annually. It upports also a convalescent home at Bexhill. Contributions hould be sent direct to the secretary, Mr. T. Glenton Kerr, t the hospital, Hackney-road, Bethnal Green, E. 2, cheques eing made payable to "Queen's Hospital" and crossed Barclay's Bank, a/c of Payee."

NATIONAL INSURANCE.

The National Health Insurance Bill.

THE Bill to amend the Acts relating to National Health Insurance does not, to any appreciable extent, affect directly the practice of medical practitioners upon the panels. It is, in fact, concerned with such financial questions as came before the Departmental Committee recently presided over by Sir Gerald Ryan, including the strengthening of the financial position of Friendly Societies, and the adjustment of difficulties due to miscalculation of the incidence of sickness among women, and with the simplification of administration, particularly in matters affecting the societies. It has passed its second reading and no very material alteration of its provisions in committee is to be anticipated.

Clause 20 amends the law with respect to contributors to insurance who are inmates of hospitals, asylums, and other institutions enumerated in Section 12 of the principal Act, enacting a fresh subsection to take the place of Subsection 2. In this clause conditions under which contributions may be made to the institution in which the patient has been treated, from moneys due to him or her, are laid down, the conditions, as before, being such that no profit to any hospital from such a source is to be expected. Clause 31 provides for the application of certain provisions of the Arbitration Act, 1889, by regulations to be made by the Insurance Commissioners, in the case of inquiries as to the desirability of retaining the name of a medical man or pharmaceutical chemist on the list. The provisions referred to affect procedure and costs, and the costs of any such inquiry are taken from the control of the person holding the inquiry and assigned to the Commissioners.

Special provisions are now made with respect to married women, subject to certain specified conditions, by Clause 22, which enacts that "any woman being an insured person and a member of an Approved Society who marries, shall, if she gives to her Approved Society notice of her marriage within one month thereof, and notice of her election in that behalf within six weeks, after the date of her marriage, be entitled, subject to the provisions of this Act, in lieu of the ordinary benefits under Part I. of the principal Act, to receive by way of benefit payment of a sum of 40*s*. (in this Act referred to as 'marriage benefit') and also until the termination of the year next following the year in which she was married, or if she had ceased to be employed within the meaning of Part I. of that Act before being married, until the termination of the year next following the year in which she ceased to be so employed, to receive medical and sanatorium benefit."

Clause 36 amends Section 63 of the principal Act, which provides for inquiries into causes of excessive sickness and matters connected with it by ordering that where such an allegation as is contemplated by Section 63 is made by an Approved Society or Insurance Committee, and no agreement is arrived at with the person or authority concerned, the matter shall be referred to the Insurance Commissioners, but no application shall be made for an inquiry until the Commissioners are satisfied that a *primâ facie* case for such is disclosed. In the same section (63) the inquiry held has for one of its objects the ascertaining whether there has been sickness "in excess of the average expectation of sickness by more than 10 per cent." For the words quoted the following are now substituted: "In excess of the amount of sickness which, in the opinion of the person holding the inquiry, ought, in all the circumstances of the case, to have occurred." The expression in connexion with sickness which admits that it "ought to occur" may strike some as a little strange, and presumably is intended to convey the meaning "might reasonably have been expected to occur."

The fate of funds arising incidentally to the administration of the Act from unexpected sources, such as the neglect of contributors to place themselves in a position to obtain the benefits provided by the Act, is always a matter of interest to the medical profession, as well as to others whose emoluments under the Act have not realised the more sanguine expectations formed by some in the days immediately following its introduction. Certain sums contributed in respect of which "no claim has been made by or on behalf of any Approved Society or any deposit contributor for the crediting of those sums to the society or the Deposit Contributors

Fund" are now to be applied "towards discharging the liabilities of the Insurance Commissioners to Approved Societies in respect of reserve values."

The Insurance Act Pharmaceutical Service.

The National Health Insurance Commissioners have recently sanctioned a small increase in the dispensing fees paid to panel chemists, and, in notifying the Pharmaceutical Society that the Treasury has given its authority to this additional allowance, the Commissioners state that the granting of it is conditional upon a satisfactory and adequate pharmaceutical service being secured for the ensuing year. Were it not for the fact that this proviso with regard to the adequacy of the service is in the nature of a standing formula, it might be inferred that the exigencies of war time had entailed a depreciation in the quality or the promptitude of the pharmaceutical service. But this is not so. The Commissioners are, it is understood, thoroughly satisfied with the way in which panel chemists have fulfilled their contracts. It is true that there have been occasional complaints, but these have been remarkably few, and the majority of them on investigation have been found to be groundless. On the other hand, a minority of the panel chemists have expressed strong dissatisfaction at the rates of remuneration, and there has been talk of "going off the panel" unless these rates were substantially increased. This minority, however, has failed to impress the majority, and when put to the test those of the minority who have had the courage of their convictions have been conspicuous by their rarity. The broad fact remains that the Insurance Commissioners are satisfied with the pharmaceutical service and that the Local Insurance Committees which are in intimate contact with the panel chemists and which have special subcommittees to investigate complaints are also satisfied. This is particularly gratifying in view of the difficult circumstances prevailing; many panel chemists are understaffed, but they, like the rest of the community, have proved themselves capable of putting in more work than they were accustomed to in the old days. Moreover, the prescription frequency has been rather lower and time- and labour-saving devices have not been despised.

It is, of course, admitted that all the general working expenses of pharmacists, quite apart from the colossal advances in the prices of drugs, have increased considerably during the past three years. Notwithstanding this increase panel chemists had been granted, up to the time of the concession already alluded to, only a very small extra allowance for dispensing medicines for insured persons. To be precise, the increase in the fee was 0·3*d.* per prescription. Obviously this was inadequate to meet the situation, and in granting a further addition of 0·45*d.*—to come into force on Jan. 1st, 1918—the Commissioners recognise this. It is estimated that the total sum per annum represented by this extra 0·45*d.* per prescription is about £54,000. Looked at as a whole this is a goodly sum, but apportioned among the whole of the panel chemists in England and Wales—in round figures about 9000—the average share will amount to a comparatively trifling amount, for £6 per head cannot be regarded as a very substantial extra war bonus. But since it is as much as the Commissioners are disposed to grant there is nothing for the panel chemists to do but accept it with the best grace possible.

PANEL RESIGNATIONS IN CHESHIRE.—The Local Medical and Panel Committee of the County Palatine of Chester on Nov. 19th handed in to the Cheshire Insurance Committee 152 resignations from the panel of doctors in Cheshire subject to the following two qualifications:—

1. The signatories are willing to accept service at the capitation rate of 10*s.* per head per annum (exclusive of drugs and appliances), calculated on the list of persons accepted by or assigned to them under Section 25 of Part III. of the Medical Benefit Regulations.
2. Should the Insurance Acts Committee of the British Medical Association, after the negotiations which they are at present conducting with the Commissioners, conclude a settlement satisfactory to the whole profession, then the signatories would be willing to accept that settlement and withdraw their resignations.

In a covering letter the Committee states that it had offered an interview with the Insurance Commissioners with regard to the whole matter, but had been informed by them that Exchequer moneys and the interests of practitioners being involved, the Commissioners were not in a position to treat with individual panel committees.

Correspondence.

"Audi alteram partem."

THE SOURCE OF SPIROCHÆTES IN URINE.

To the Editor of THE LANCET.

SIR,—In your issue of Nov. 17th Captain C. P. Symonds, R.A.M.C., suggests that the urinary spirochætes described in our article in THE LANCET of Nov. 3rd might be an accidental contamination derived from the lower urethra or prepuce. Lieutenant James L. Stoddard, M.O.R.C., U.S.A., has shown that spirochætes (not of the *refringens* type) can be found in the urethra of 33 per cent. of cases selected from healthy individuals and hospital patients; this observation would appear to lend colour to the suggestion put forward by Captain Symonds. Since our paper was forwarded to you for publication we have found the spirochæte in a catheter specimen of urine from a case of trench fever. Again, one of our positive cases gave negative urethral scrapings daily over a period of a week.

The fact that a number of apparently healthy persons are affected with a urethral spirochætosis does not necessarily prevent them from developing a renal spirochætosis as well. Would Captain Symonds suggest that the urinary spirochætosis of Weil's disease is of urethral origin? Of 100 cases of Weil's disease some 33 might have a urethral spirochætal infection, but careful search at the right stage of the disease would reveal the existence of urinary spirochætes (*S. icterohæmorrhagica*) in them all. Of our cases of trench fever—with the exception of three which were examined once only—all showed the presence of spirochætes.

We may summarise our reasons for believing that the spirochætes which we have described do not originate in the lower urinary passages as follows: (1) They have been found in a catheter specimen. 2. They appear in the urine when urethral scrapings are negative. 3. They can be found in all cases of trench fever if diligent search be made, and are in only 33 per cent. 4. They are not present in every specimen of trench fever urine—in one of our cases they were present in five samples only ou of 21 examined; had they originated in the urethra or prepuce it is permissible to suppose that they would have been present in every specimen. 5. They are most numerous in the urine about the sixteenth day of illness.

Clinically, trench fever presents features common to protozoal diseases—viz., the periodicity of the pyrexia, the peculiarly intense headache, and the delayed onset of the characteristic limb pains. It is also of interest to note the observation of Moreland McCrea and Carnegie Dickson[1] that the blood in late stages of the disease gives a positive Wassermann reaction.—We are, Sir, yours faithfully,

A. T. NANKIVELL.
C. E. SUNDELL.

Stationary Hospital, B.E.F., Nov. 19th, 1917.

WAR DEAFNESSES.

To the Editor of THE LANCET.

SIR,—In reply to the letter of Dr. Dan McKenzie in your issue of Nov. 17th, I beg to say that I have carried out vestibular tests in many cases of "perceptive deafness," and that I am acquainted with his views as expressed during the discussion on nystagmus.[3] Neither my own experience nor Dr. McKenzie's observations tend to make me in any way modify the opinion expressed in my previous letter. That letter was written to discuss the question whether the presence of vestibular reaction could be used as a diagnostic of hysterical deafness, and my contention is that in this relation it is "not of supreme importance." I am quite ready to admit that its absence would be strong evidence in favour of an organic lesion of the labyrinth, but that aspect of the matter did not call for consideration, if only because the proposition is self-evident.

Let me put this query to Dr. McKenzie: Does he seriously believe that a man deaf from gun-fire who responds more or

---

[1] Brit. Med. Jour., Sept. 29th, 1917.
[2] THE LANCET, 1917, i., 796.
[3] Proc. Roy. Soc. Med., Otolog. Sect., April, 1914.

less normally to vestibular tests is either hysterical or malingering? If he does not, I cannot understand why he refers to the views expressed by me. If he does, he undertakes a very serious responsibility, for all of us see many men, deaf as the result of explosions, whose future will depend largely upon the reports furnished by otologists.

It would occupy too much space to criticise Dr. McKenzie's views seriatim, but I may perhaps allow myself one or two remarks. Among his cases are some in which he himself admits organic lesion of the internal ear, and yet vestibular reactions were normal or increased. The occurrence of such instances would, in common justice, negative the assumption that the presence of a normal vestibular reaction is indicative of purely functional trouble. Again, it appears to me that Dr. McKenzie is too prone to assume that deafness is functional. For example, he says, "bearing in mind, however, the fact that hysterical or functional deafness, like any other manifestation of this disorder, is often obstinate and persistent." Now, as I pointed out in my previous letter, hysterical deafness can only be diagnosed with certainty after it has been cured, therefore it cannot be diagnosed with certainty *while it persists*. It may, indeed, be strongly suspected, but can Dr. McKenzie give any other absolute proof? Apart from the presence of a suggestive history or the existence of unmistakable hysteria, can he even give a list of symptoms which would afford very strong reasons for suspicion?

I am, Sir, yours faithfully,

Edinburgh, Nov. 19th, 1917. P. MCBRIDE.

CIRCINATE RASHES AFTER ANTITOXIN.

To the Editor of THE LANCET.

SIR, In an annotation in your issue of Nov. 17th you write: "With the production of an antidiphtheritic serum of high potency the appearance of serum disease, so frequent in the early days of antitoxic treatment, diminished almost to vanishing point." The following figures show the percentage incidence of serum rashes during the treatment of diphtheria in the hospitals of the Metropolitan Asylums Board from 1898 to 1914 inclusive:—

Year.	Percentage incidence of rashes.	Year.	Percentage incidence of rashes.
1898	45·0	1907	25·0
1899	34·5	1908	30·3
1900	42·6	1909	30·3
1901	43·6	1910	30·6
1902	47·4	1911	30·6
1903	44·8	1912	30·1
1904	43·1	1913	31·2
1905	32·8	1914	32·9
1906	30·6		

I believe the actual incidence to be higher than these statistics indicate owing to failure to observe or note all rashes, but they are sufficient to show that, though a drop took place after 1904, serum disease has not "diminished almost to vanishing point."

You describe the rashes 20 years ago as follows: "Exanthem of urticarial type; more rarely rashes occur resembling scarlatina or measles." In a letter I wrote you referring to an article by Captain S. Wyard on anaphylaxis, and which you kindly published in your issue of Jan. 27th last, I drew attention to the circinate erythema as being next in frequency of occurrence to urticaria. In the *British Medical Journal* some 15 years ago, Stanley, I think, stated that the circinate erythema was more common than any other eruption. This has not been so for a number of years, but although the circinate erythema is much less common than the urticaria, it is not uncommon. Captain Wyard, in his letter in your issue of Feb. 10th, said the circinate rash had not come under his observation, but I presume his experience lay amongst adults. At all events, the fact that a circinate rash does occur, and that it is next in frequency, is well known to those experienced in serum disease.

Among those who have not undergone serum treatment previously the days of election for the first appearance of the urticarial rash are the seventh, eighth, and ninth after injection, and it may appear at any time subsequent to the injection up to the fourteenth or fifteenth day, but rarely later. In those who have undergone serum treatment previously the urticarial rash is almost invariably accelerated. It may appear within a very short time, and most commonly does so in about 24 to 48 hours. The circinate erythema occurs from about the tenth to the twentieth day, and is much more common in those who have suffered from a previous urticaria. It is true that continued high temperature does occur rarely, and also diarrhœa, but it has not been my privilege to see serum disease simulate enteric fever.

Anaphylaxis is rare, and I have not yet seen a case follow upon anti-anaphylactic treatment, but the anti-anaphylactic treatment does not appear to make any difference to the acceleration of the serum disease which I mention above.

I am, Sir, yours faithfully,

FREDERIC THOMSON.

North-Eastern Hospital, Tottenham, N., Nov. 19th, 1917.

RECURRENT ATTACKS OF FEVER.

To the Editor of THE LANCET.

SIR,—The disease discussed by Dr. R. V. Solly (Sept. 8th, p. 386) and Professor Tanner Hewlett (Oct. 8th, p. 552) can hardly be rat fever. I have recently attended a well-marked case for 12 months, in which rat infection could be pretty certainly excluded, or, indeed, a wound of any kind. The only organism found in the blood was *Bacillus fæcalis*, and the febrile attacks occurred on the average every 10 days.

The patient was an active, vigorous old man, in good health, except for some prostatic trouble. In the early part of October, 1916, he was attacked with fever, rigors, hiccough, and œdema of the right lower limb. No thrombosis could be detected, but the swelling continued. The fever returned from time to time and settled down to fairly regular attacks every ten days, which continued till his death, Nov. 5th, 1917. Between them he picked up and even got out of doors in fine weather. The onset was marked with a shiver, headache, and great drowsiness, and followed by obstinate hiccough and vomiting. The fever only reached 100° F. or 101°, and fell in a day or two. The pulse did not rise above 80. The leg remained white and œdematous for about nine months, but during one attack a red flush spread over it like an ordinary erysipelas. A cultivation was taken from near the edge of the œdema, and a vaccine was made from the *Bacillus fæcalis* found there by Professor I. Walker Hall. The result was remarkable, in that after two or three doses the massive swelling of the leg vanished entirely, but the patient so feared the reaction that he could not be induced to continue them or to have galyl. The febrile paroxysms went on. Sulphur, quinine, and cinnamon had no effect. He finally failed to take food and died much emaciated. The heart was at one time dilated and irregular, but recovered after the vaccine.

It was clearly not malignant endocarditis, nor erysipelas. Shearman and Moorhead noted 11 cases in Egypt in soldiers where this organism was found, but the relapses did not exceed two or three. The chills, vomiting, and slow pulse were present in their patients.[1] More often the *B. fæcalis* is not associated with clinical symptoms.

I am, Sir, yours faithfully,

Clifton, Bristol, Nov. 19th, 1917. GEORGE PARKER.

SIR RICHARD CROFT AND THE CASE OF THE PRINCESS CHARLOTTE.

To the Editor of THE LANCET.

SIR,—I much wish I could support my friend Dr. Hingston Fox in the two points he advances in this matter. The facts of the case, however, prevent my doing so.

1. Dr. Fox states that Queen Charlotte was attended in her confinements not only by Mrs. Draper, the midwife, but by Dr. William Hunter, the official accoucheur. If Dr. Fox will look into the "Obstetric Diary" kept by Dr. Hunter, and printed by Dr. Stark, he will see that Dr. Hunter was never called in until after the baby was born, and his official duty was limited to feeling the Royal pulse and examining the Royal placenta.

2. Upon the authority of Wadd, Dr. Fox states that Sir Richard Croft possessed the M D. degree. Wadd was a gossipy, merry writer, and would not, I think, be considered an authority in the matter. Neither the "D.N.B." nor Burke's *Baronetage* gives Croft a degree. He practised medicine at Oxford for a short time, but the *Alumni Oxonienses*

[1] Brit. Med. Jour., Dec. 30th, 1916.

merely styles him "chirurgus priviligiatus," and mentions no degree. Those who think he graduated M.D. while at Oxford have probably confused him with his son, also named Richard, who was at Balliol College, and who graduated both in Arts and in Medicine.

That Sir Richard Croft was a brilliant practitioner there can be little doubt; that he was in no way responsible for the death of the Princess is equally certain; that he possessed a degree or a diploma is very questionable. He practised at a time when technical qualifications were not necessary. I am, Sir, yours faithfully,

S. D. CLIPPINGDALE, M.D.

Holland Park-avenue, W., Nov. 25th, 1917.

THE SERVICES.

ROYAL NAVAL MEDICAL SERVICE.

P. Ward to be temporary Surgeon.

ARMY MEDICAL SERVICE.

Col. (temp. Surg.-Gen.) H. N. Thompson, C.M.G., D.S.O., on completion of four years in his rank, is retained on the Active List, under the provisions of Arts. 120 and 522 Royal Warrant for Pay and Promotion.

Assistant Director of Medical Services: Temp. Major J. S. Jenkins, D.S.O., Canadian A.M.C., and to be Temporary Lieutenant-Colonel whilst so employed.

Deputy Assistant Director of Medical Services: Temp. Major A. Macphail, Canadian A.M.C.

Temp. Lieut.-Col. C. E. Doherty, Canadian A.M.C., relinquishes his appointment.

ROYAL ARMY MEDICAL CORPS.

Major E. L. Moss, M.C., to be acting Lieutenant-Colonel whilst in command of a Medical Unit.

R. M. Ranking to be Major.

To be temporary Majors: Temp. Capt. E. R. Fothergill and Temp. Capt. A. H. Cameron Smith, Canadian A.M.C., M.C.

Temp. Capt. H. C. T. Langdon to be temporary Major while specially employed.

M. R. MacKay, late temporary Captain, is granted the honorary rank of Captain.

Temporary Lieutenants to be temporary Captains: A. G. H. Lovell, H. V. Swindale, C. E. Pepper, W. J. Stephens, G. Lewin, D. C. Norris, K. W. D. MacRae, J. Leach, L. Leslie, A. G Carment, W. A. Hotson; S. W. H. Stuart, R. A. Smith, W. J. Smyth, J. S. E. Selby, H. Ainscow, H. G. K. Young, B H. Moore, B. Knowles, J. Laing, P. R. McNaught, J. Cruickshank, W. Montgomery, H. M. Grey, T. S. S. Holmes, J. A. C. Greene, J. Pryce-Davies, G. H. Morris, R. H. Rains.

A. MacD. Westwater to be temporary honorary Captain whilst serving with the Red Cross Hospital, Bellahouston.

Officers relinquishing their commissions: Temp. Major H. D. Harrison (on ceasing to be employed at the Welsh Metropolitan War Hospital). Temporary Captains: F. W. H. Hutchinson, R. Forbes (and is granted the honorary rank of Captain), H. Cross (on account of ill-health), S. K. Adams, J. W. B. Thorburn, J. C. Mackwood, F. P. Maitland, J. H. Parsons, R. P. N. B. Bluett, B. M. Bennett, W. McDermott, A. Moyse, J. Spencer-Daniell. Temporary Lieutenants: D. V. Muller (on account of ill-health), W. S. Wildman, A. J. Macvie, E. A. Bullmore.

SPECIAL RESERVE OF OFFICERS.

Lieutenants to be Captains: P. T. Jones, A. Rodd, I. Aubrey, M.C., R. B. Hawes, H. J. Duske, D. V. Murphy, W. J. M. White, E. O. A. Singer, J. H. Vance, E. Butler.

To be Lieutenants: R. N. Mackenzie, Capt. J. I. Watson (from Territorial Force Reserve), H Taylor, C. Shaw-Crisp (from University of London Contingent, O.T.C.).

Capt. T. D. Renwick relinquishes his commission on account of ill-health caused by wounds.

TERRITORIAL FORCE.

Lieut.-Col. R. M. Wilson resigns his commission on account of ill-health and is granted permission to retain his rank and wear the prescribed uniform.

Major (temp. Lieut.-Col.) F. J. Steward, Capt. (temp. Major) H. W. Wilson, and Capt. (temp. Major) T. B. Mouat relinquish their temporary rank and are restored to the Establishment.

Major W. M. Sturrock and Capt. J. F. Neary resign their commissions on account of ill health.

Capt. J. G. Emanuel and Capt. J. Pearson are restored to the Establishment.

Capt. W. H. G. Ball is seconded for duty with a General Hospital.

Capt. F. V. Milburn is seconded for duty with a General Hospital.

P. G. Selby to be temporary Major, Kent Medical Volunteer Corps.

Attached to Units other than Medical Units.—Surgeon-Major A. C. Oldham, from R.F.A., to be Major, with precedence as from July 19th, 1912.

TERRITORIAL FORCE RESERVE.

Major D. E. Dickson, from R.A.M.C., to be Major.

Professor Max Henkel, Director of the Gynæcological Clinic at Jena, has been relieved of his post by a disciplinary court of the High Duchy on the ground of unprofessional conduct, "especially a lax indication for operative measures and for terminating pregnancy." Czerny, Lexer, Hofmeier, Winter, Puppe, and Binswanger were among the witnesses in the case.

The War.

THE CASUALTY LIST.

THE following names of medical officers appear among the casualties announced since our last issue:—

Killed.

Col. W. W. Hearne, D.S.O., Australian A.M.C., qualified at Melbourne in 1894, and was in practice at South Melbourne, where he was anæsthetist to the Alfred Hospital since 1903, prior to joining the Expeditionary Force. The award of the D.S.O. was recorded in THE LANCET of June 9th, 1917, p. 894.

Major N. J. Bullen, Australian A.M.C.

Died of Wounds.

Capt. L. L. McKeever, R.A.M.C., attached Royal Scots, qualified in Ireland in June, 1914, and joined up in 1915.

Major W. L. MacLean, Canadian A.M.C., qualified in Canada in 1908, and was in practice at Glace Bay, South Cape Breton, Nova Scotia, prior to joining the Expeditionary Force.

Capt. G. A. Harvey, R.A.M.C., qualified at Adelaide, New South Wales, in 1911, and after holding an appointment at a local hospital came to England and registered in March, 1914, and became house surgeon at the West London Hospital. Soon afterwards he joined the R.A.M.C.

Died.

Capt. N. J. H. Gavin, M.C., R.A.M.C., qualified at Edinburgh in 1904, and held appointments at the Norfolk County Asylum and at the West Riding Asylum, Wakefield. Later he went to Dunedin, New Zealand, and on returning to England became assistant medical officer at the Menston Asylum, near Leeds, and before joining up was on the staff at the Three Counties Asylum, Arlesey, Hitchin. The award of the M.C. was recorded in THE LANCET of June 9th, 1917, p. 894.

Wounded.

Capt. C. F. Backhouse, R.A.M.C.
Capt. R. T. Cæsar, R.A.M.C.
Capt. J. F. Edmiston, R.A.M.C.
Capt. G. Hislop, R.A.M.C.
Capt. W. W. Morrison, R.A.M.C.
Capt. E. H. Scholefield, R.A.M.C.
Capt. D. P. Thomas, R.A.M.C.
Capt. D. A. MacLeod, Canadian A.M.C.
Lieut. A. S. Porter, Canadian A.M.C.
Capt. W. H. Scott, Canadian A.M.C.
Capt. H. W. Whytock, Canadian A.M.C.
Capt. W. A. Murphy, R.A.M.C., attached King's Own Scottish Borders.
Lieut. A. Rodd, R.A.M.C., attached Royal Field Artillery.
Capt. W. L. Millett, Australian A.M.C.
Capt. E. L. Morgan, Australian A.M.C.
Capt. A. V. Glendinning, R.A.M.C.
Major W. M. A. Fletcher, Australian A.M.C.
Capt. W. K. Colbeck, Canadian A.M.C.
Capt. G. M. Foster, Canadian A.M.C.
Capt. B. R. Mooney, Canadian A.M.C.
Lieut. V. C. Montgomery, R.A.M.C.
Capt. H. P. Caithness, R.A.M.C.
Capt. A. H. Falkner, R.A.M.C., attached Royal Lancaster Regiment.
Capt. J. H. Paul, R.A.M.C.
Capt. T. A. Carson, Canadian A.M.C.
Capt. W. W. Morrison, R.A.M.C.
Capt. A. Jones, R.A.M.C.

CASUALTIES AMONG THE SONS OF MEDICAL MEN.

The following additional casualties among the sons of medical men are reported:—

Capt. I. Heaton, Royal West Kent Regiment, died of wounds, only child of Dr. C. J. Heaton, of Westgate-on-Sea, Kent.

Capt. and Adjutant Sir H. G. T. Butlin, Bart., Cambridgeshire Regiment, reported wounded and missing Sept. 16th, 1916, now presumed killed in action, only son of the late Sir H. T. Butlin, Bart., President of the Royal College of Surgeons of England, 1909-11.

Second Lieut. W. S. F. Saundby, Yorkshire Regiment, reported missing Nov. 17th, 1916, now presumed killed in action, youngest son of Dr. R. Saundby, of Edgbaston, Birmingham.

Sergt. F. H. Clouting, Australian A.S.C., killed in action, youngest son of the late Mr. J. R. Clouting, F.R.C.S., of Thetford, Norfolk.

Second Lieut. M. L. Atkinson, Tank Corps, killed in action, only surviving son of Dr. M. C. Atkinson, of Leamington.

OBITUARY OF THE WAR.

KENNETH ANGUS MACCUISH, M.D. NOVA SCOTIA,

CAPTAIN, CANADIAN ARMY MEDICAL CORPS.

Captain K. A. MacCuish, who was recently killed on the Western front, at the age of 42 years, was a native of St. Peter's, Nova Scotia, graduated at Dalhousie University, Halifax, in 1903, and had been in practice at Glace Bay, Nova Scotia. Here he saw a considerable amount of major surgery, Glace Bay being a mining district, and fractures and severe wounds being not uncommon. When at the close of 1915 No. 9 Canadian Stationary Hospital was organised in his native province he joined it, coming over to England in the early summer of 1916. He was attached first to the Granville Canadian Special Hospital at Ramsgate, then for five months was the surgical specialist to the Bramshott Military Hospital, rejoining his unit in April, 1917, when this went to France. A hard and loyal worker and an excellent surgeon, Captain MacCuish rapidly made his name in the medical service. A recent action demanded its toll from the C.A.M.C., as from other units engaged. Captain Ireland, regimental medical officer to one of the Canadian battalions, having fallen in action, MacCuish volunteered from his unit to take his place, only to fall himself. His friend and partner at Glace Bay, Major McLean, attached to a Canadian casualty clearing station, died of wounds a few days later.

JOHN BEAUFOY RANDALL, B.SC., M.B., B.S. LOND.,

CAPTAIN, ROYAL ARMY MEDICAL CORPS.

Captain J. B. Randall, who was killed in action on Oct. 31st at the age of 28 years, was younger son of Mr. Vyndham Randall, M.R.C.S., of Bridgend, Glam. Educated at Bridgend County School, he took honours certificates of the Central Welsh Board, and graduated in Science at University College, London, with honours in physiology. He then took his medical course at St. Bartholomew's Hospital, and graduated in 1914 with distinction in medicine. Before joining the R.A.M.C. he held for 12 months the post of house surgeon at St. George's Hospital. His early death terminates a career of much promise.

THE HONOURS LIST.

The following awards to medical officers are announced. The acts of gallantry for which the awards were made are not yet announced. All are members of the R.A.M.C. unless otherwise stated. The dates in parentheses, in those cases where bars have been awarded, refer to the number of THE LANCET in which a record of the original decoration will be found:—

Bar to the Distinguished Service Order.—Major (Temp. Lt.-Col.) J. Hanafin, D.S.O (Jan. 22nd, 1916, p. 215); Temp. Capt. R. McC. Hill, D.S.O. (May 20th, 1916, p. 1059).

Distinguished Service Order.—Major W. B. Craig, Australian A.M.C.; Temp. Capt. J. C. Dunn, M.C.; Temp. Capt. E. H. Griffin, M.C.; Major A. Hailes, Australian A.M.C.; Major H. B. Lee, M.C., Australian A.M.C.; Major K. MacCormick, New Zealand M.C.; Major R. McMaster, Australian A.M.C.; Capt. and Bt.-Major H. F. Panton, M.C.

Bar to the Military Cross.—Temp. Capt. W. T. Brown, M.C. (Oct. 6th, 1917, p. 550); Temp. Lieut. (Temp. Capt.) H. A. Harbison, M.C. (Sept. 2nd, 1916, p. 450); Temp. Capt. C. R. R. Huxtable, M.C. (July 28th, 1917, p. 135); Capt. C. H. Leedman, M.C., Australian A.M.C. (July 28th, 1917, p. 136); Capt. Greg Mackay, M.C. (Sept. 30th, 1916, p. 620); Temp. Capt. C. J. O'Reilly, M.C. (Nov. 13th, 1915, p. 1112); Capt. P. J. F. O'Shea, M.C., Australian A.M.C. (Nov. 24th, 1917, p. 805); Temp. Capt. J. F. McG. Sloan, M.C. (July 28th, 1917, p. 136); Temp. Capt. G. Walker, M.C. (Nov. 18th, 1916, p. 881).

The Military Cross.—Capt. W. M. Abbott, New Zealand A.M.C.; Capt. D. L. Barlow, Australian A.M.C.; Capt. C. H. Brennan, Spec. Res.; Capt. J. H. B. Brown, Australian A.M.C.; Temp. Lt. (Temp. Capt.) R. J. Clausen; Capt. G. Crawshaw; Capt. A. Curtis, Australian A.M.C.; Temp. Capt. D. E. Derry; Temp. Capt. T. Duncan; Capt. F. Ellis; Temp. Capt. A. Gaston; Capt. S. G. Gibson, Australian A.M.C.; Capt. MENTIONED IN DESPATCHES.

In a despatch dated June 28th, 1917, received from General Sir A. Murray, G.C.M.G., K.C.B., late General Officer Commanding in Chief, Egyptian Expeditionary Force, dealing with the operations in Egypt under his command from March 1st to June 28th, 1917, the following reference to the medical services occurs:—

"The health of the troops has throughout been singularly good. All branches of the medical services, under Surgeon-General J. Maher, C.B., deserve the highest commendation for their successful work at the front, on the lines of communication, and in the base hospitals. The presence in the force of a number of civil medical consultants, who have so patriotically given their services, has been of the very greatest value, and they have worked in successful accord with the regular medical services of the Army. The Australian Army Medical Corps and the New Zealand Medical Corps have also been remarkable for their efficiency and unremitting devotion."

In a further despatch Sir A. Murray will submit the names of those whom he wishes to bring to notice for gallant and distinguished service during the period under review.

QUEEN MARY'S CONVALESCENT HOSPITAL, ROEHAMPTON.

A MEETING was held at Lady Wantage's house in Carlton-gardens on Wednesday last to discuss the future of this institution, wherein such splendid work has been done for limbless soldiers. Lieutenant-General Sir Francis Lloyd, chairman of the committee of the hospital, traced the history of the institution, summarised its work, and suggested that a formal appeal should be made to the public for at least £100,000 to ensure the proper continuance of its activities. Mr. Walter Long and Colonel Openshaw, chief surgeon to Roehampton Hospital, supported this view, which was unanimously adopted.

HELP FOR WOUNDED SAILORS AND SOLDIERS.—The Central Depôt of the Surgical Branch of Queen Mary's Needlework Guild, 2, Cavendish-square, W., calls the attention of medical men, matrons of hospitals, and others concerned with the welfare and comfort of the sick and wounded to the fact that one of the aims of the Guild is to supply the ordinary dressings, appliances, and comforts required for the troops at home and abroad, as well as special surgical appliances which a surgeon might have difficulty in procuring through ordinary channels.

THE LATE MAJOR PETER MACGREGOR.—Major Peter MacGregor, R.A.M.C., honorary surgeon to the Huddersfield War Hospital, who died on Nov. 15th after an illness extending over a year, was 62 years of age, having been born at Rannoch, Perthshire, in 1855. He received his medical education at the Edinburgh Medical School, qualifying in 1877 as L.R.C.P. & S. Edin., and taking the surgical Fellowship in 1892. After holding some medical appointments in Lancashire and in Kent he entered on practice in Huddersfield, where he quickly achieved success. In 1898 he became honorary surgeon to the Huddersfield Royal Infirmary, and did much to add to the financial resources of that institution, his efforts resulting in an augmentation of the workpeople's contributions from £1000 to £2200, a figure which was maintained for several years. He also assisted in the establishment of the Huddersfield Medical Society, of which he was a former president. In 1896 he was placed on the commission of the peace for the borough. He leaves a widow, two daughters, and one son.

URBAN VITAL STATISTICS.

(Week ended Nov. 24th, 1917.)

English and Welsh Towns.—In the 96 English and Welsh towns, with an aggregate civil population estimated at nearly 17,000,000 persons, the annual rate of mortality was equal to 12·3, against 11·8 and 12·2 per 1000 in the two preceding weeks. In London, with a population exceeding 4,000,000 persons, the death-rate was 13·1, or 0·6 per 1000 above that recorded in the previous week; among the remaining towns the rates ranged from 5·2 in Ilford, 5·3 in Barnsley, and 6·4 in Ealing, to 18·6 in Brighton, 19·4 in Wigan, and 29·2 in Dewsbury. The principal epidemic diseases caused 275 deaths, which corresponded to an annual rate of 0·8 per 1000, and included 94 from measles, 76 from infantile diarrhœa, 51 from whooping-cough, 39 from diphtheria, 13 from scarlet fever, and 2 from enteric fever. Measles caused a death-rate of 1·7 in St. Helens, 3·6 in Acton and in Stockton-on-Tees, and 9·1 in Dewsbury, and whooping-cough of 2·2 in Gateshead and 2·7 in Stockton-on-Tees. The 1315 cases of scarlet fever and the 1588 of diphtheria under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital were respectively 54 and 101 above the numbers remaining at the end of the previous week. Of the deaths from all causes in the 96 towns, 157 resulted from violence. The causes of 26 deaths were uncertified, of which 7 were registered in Birmingham, 3 in South Shields, and 2 each in Gillingham, Liverpool, and Blackpool.

Scotch Towns.—In the 16 largest Scotch towns, with an aggregate population estimated at nearly 2,500,000 persons, the annual rate of mortality was 12·2, against 11·9 per 1000 in each of the two preceding weeks. The 259 deaths in Glasgow corresponded to an annual rate of 12·1 per 1000, and included 7 from infantile diarrhœa, 6 from diphtheria, 3 from whooping-cough, and 2 from measles. The 63 deaths in Edinburgh were equal to an annual rate of 10·7 per 1000, and included a fatal case of scarlet fever.

Irish Towns.—The 115 deaths in Dublin corresponded to an annual rate of 15·0, or 1·9 per 1000 less than that recorded in the previous week, and included 5 from infantile diarrhœa, 2 from measles, and 1 from whooping-cough The 109 deaths in Belfast were equal to a rate of 14·5 per 1000, and included 4 from whooping-cough, 2 from infantile diarrhœa, and 1 from measles.

VITAL STATISTICS OF LONDON DURING OCTOBER, 1917.

In the accompanying table will be found summarised complete statistics relating to sickness and mortality in the City of London and in each of the metropolitan boroughs. With regard to the notified cases of infectious diseases, it appears that the number of persons reported to be suffering from one or other of the ten diseases specified in the table was equal to an annual rate of 5·3 per 1000 of the population, estimated at 4,237,387 persons; in the three preceding months the rates had been 3·5, 3·1, and 4·2 per 1000. The lowest rates in October were recorded in Kensington, Hampstead, Stoke Newington, Holborn, and the City of London; and the highest rates in Chelsea, Bethnal Green, Stepney, Southwark, and Bermondsey. The prevalence of scarlet fever showed a marked increase over that recorded in other recent months; this disease was proportionally most prevalent in Chelsea, the City of Westminster, Bethnal Green, Bermondsey, Wandsworth, and Lewisham. The Metropolitan Asylums Hospitals contained 1130 scarlet fever patients at the end of the month, against 644, 615, and 807 at the end of the three preceding months; the weekly admissions averaged 177, against 101, 83, and 138 in the three preceding months. Diphtheria was more prevalent than it had been in any of the preceding months of this year; the greatest proportional prevalence of this disease was recorded in Finsbury, Bethnal Green, Southwark, Bermondsey, Deptford, and Woolwich. The number of diphtheria patients under treatment in the Metropolitan Asylums Hospitals, which had been 1070, 1003, and 1111 at the end of the three preceding months, had risen to 1398 at the end of October: the weekly admissions averaged 206, against 142, 122, and 168 in the three preceding months. The prevalence of enteric fever was less than it had been in any of the four preceding months; of the 39 cases notified in October, 5 belonged to Stepney, 4 to Poplar, 3 to Paddington, 3 to Lambeth, and 3 to Battersea. There were 31 cases of enteric fever under treatment in the Metropolitan Asylums Hospitals at the end of the month, against 41, 45, and 46 at the end of the three preceding months; the weekly admissions averaged 7, against 6 in each of the preceding months. Erysipelas was proportionally most prevalent in Chelsea, Shoreditch, Bethnal Green, Stepney, Southwark, and Deptford. The 15 cases of puerperal fever notified during the month included 3 in Islington, 3 in Stepney, 3 in Wandsworth, and 2 in Fulham. Of the 20 cases of cerebro-spinal meningitis 2 belonged to Kensington, 2 to Hammersmith, 2 to St. Pancras, 2 to Shoreditch, 2 to Bethnal Green, 2 to Stepney, and 2 to Lambeth; while of the 7 cases of poliomyelitis 2 belonged to Kensington and 2 to Hammersmith.

The mortality statistics in the table relate to the deaths of persons actually belonging to the several boroughs, the deaths occurring in institutions having been distributed among the boroughs in which the deceased persons had previously resided. During the five weeks ending Nov. 3rd, the deaths of 5087 London residents were registered, equal to an annual rate of 12·5 per 1000; in the three preceding months the rates had been 10·9, 10·5, and 11·0 per 1000. The death-rates in October ranged from 9·0 in Hampstead, 9·6 in Chelsea and in Woolwich, 9·8 in the City of London and in Wandsworth, and 10·0 in the City of Westminster, to 14·3 in Stepney, 14·5 in Holborn, 15·0 in Bermondsey, 16·6 in Southwark, 19·1 in Shoreditch, and 19·8 in Finsbury. The 5087 deaths from all causes included 408 which were referred to the principal infectious diseases; of these, 48 resulted from measles, 8 from scarlet fever, 63 from diphtheria, 47 from whooping-cough, 6 from enteric fever, and 236 from diarrhœa and enteritis among children under 2 years of age. No death from any of these diseases was recorded during the month in the City of London; among the metropolitan boroughs they caused the lowest death-rates in the City of Westminster, Holborn, Wandsworth, and Woolwich; and the highest death-rates in Finsbury, Shoreditch, Stepney, Southwark, Bermondsey, and Deptford. The 48 deaths from measles were 30 below the corrected average number in the corresponding period of the five preceding years, and included 14 in Finsbury, 11 in Stepney, 5 in Shoreditch, and 3 each in Islington and Hackney. The 8 deaths from scarlet fever were less than one-half of the corrected average number, and included 2 in Fulham and 2 in Battersea. The 63 fata

* Including membranous croup.

cases of diphtheria were 7 in excess of the corrected average number; the greatest proportional mortality from this disease occurred in Stoke Newington, Hackney, Finsbury, Shoreditch, Southwark, and Greenwich. The 47 deaths from whooping-cough were 18 in excess of the corrected average number; this disease was proportionally most fatal in St. Pancras, Shoreditch, Poplar, Battersea, Camberwell, Deptford, and Greenwich. The 6 deaths from enteric fever were equal to half the corrected average number, and included 1 each in Kensington, Islington, Poplar, Battersea, Camberwell, and Lewisham. The 236 deaths from diarrhœa and enteritis among children under 2 years of age were less than two-thirds of the corrected average number; the greatest proportional mortality from this cause was recorded in Finsbury, Shoreditch, Bethnal Green, Stepney, Southwark, and Bermondsey. In conclusion, it may be stated that the aggregate mortality in London in October from these principal infectious diseases was more than 40 per cent. below the average.

Obituary.

FRANKLIN PAINE MALL, M.D. MICH.,

PROFESSOR OF ANATOMY AT THE JOHNS HOPKINS UNIVERSITY, BALTIMORE.

THE death of Dr. Franklin Mall at the comparatively early age of 55 (after an operation for gall-stones) is a sad loss to anatomical science. He performed two great works for the profession in the United States—he introduced new methods of teaching anatomy, and he created a school which has had, through its pupils, a widespread influence. The opening of his laboratory at the Johns Hopkins University in 1893 marks the beginning of an era for the subject in the medical schools of America. Bowditch in Boston, and Newell Martin in Baltimore, with well-equipped laboratories and new methods, had laid the foundation of the modern and flourishing American school of physiology, but anatomy was still a handmaid of surgery and of medicine, and taught in old-time dissecting rooms and in the old way. Mall changed this and made the anatomical laboratory of the medical school a workshop for teaching, training, and investigation. With the true Hunterian spirit he had little faith in lectures, but immense faith in steady, continuous concentration in practical work. "The aim," as he said, "is to make the course one continuous problem for each student to investigate, aiding each one with good material, and teaching him how to study." More stress was laid on origin and function than on the acquisition of the dry details of anatomy. The experimental investigating spirit was too strong in the laboratory to allow any but the weakest men to worry over the minutiæ, and a man's examination was largely the weekly report on the character of his work. Inferior students were mercilessly asked to go elsewhere. The best men in the school were attracted to Mall by the quiet helpful way in which they were taught how to work. His own investigations cover a wide field, and with an unequalled technique for modelling and reconstruction his papers were works of art. The *American Journal of Anatomy*, the *Anatomical Record*, and the *Journal of Morphology* testify to the zeal and ability of his pupils. To few men is it given to revolutionise completely the method of teaching and investigating a subject. This Mall did for anatomy in the United States. W. O.

EDWARD BURD, M.D., M.C. CAMB.,

CONSULTING PHYSICIAN TO THE ROYAL SALOP INFIRMARY.

WITH the death of Dr. Edward Burd, of Shrewsbury, in his ninety-first year, there has passed away a typical representative of the Victorian era. Born in Shrewsbury, educated at Shrewsbury School, serving his medical apprenticeship at the Salop Infirmary, with the exception of the few years at Cambridge University and at St. Bartholomew's Hospital, his whole life was spent in Shrewsbury, where he was for long among the most notable figures. For nearly 60 years he was on the staff of the Salop Infirmary, and his memory went back to the famous Erasmus Darwin, Charles Darwin's father, to Dr. Clements, his own immediate predecessor, a great surgeon who was Member of Parliament for the borough. No wonder that Dr. Burd loved to tell of medical ways and customs now appearing almost mythical; for instance, how he and his fellow-students at the infirmary used to toss up each morning to decide who should do the bleedings and who should do the cuppings. He was a real link between Thackerayean and Listerian medicine.

Dr. Burd's success in practice as a young man seems to have been immediate, and for nearly 50 years he did one of the biggest and most responsible practices in Great Br Of iron constitution he seems during this long period c active life never to have been ill, nor to have known fatigue meant, although he worked for 30 years with single day's holiday. A masterful man, virile, d and dominant, he inspired the confidence of his pat who found his intuition and insight wonderful, an judgment hardly ever at fault. Perhaps the secret c success lay in the intense personal interest he took in man, woman, or child with whom he came in contact. collected people as other men collect pictures, book beetles. The practice of his profession was his hobby he loved general practice, not so much for any scie pleasure it gave him as for its personal and human side a consultant, his advice was always honestly and fear given; and it must be recollected that complete cand much more difficult for the local consultant, the fi perhaps, alike of the patient and the general practiti than for the consultant living elsewhere, and called represent abstract science at its keenest.

After being obliged through illness to relinquish pra the special joy of his life had departed, but he continu take vivid interest in the world around him, and espe in its people and their doings, remaining to the end c life a power in the county of Shropshire and one advice was sought in many capacities. H. W.

TIMOTHY HENRY MARTIN, M.R.C.S. ENG., L.S

THE death occurred at his residence at Crawle Nov. 5th, of Mr. T. H. Martin, who, until a few year when he retired, was a well-known practitioner in Sussex. Born at Merthyr Tydvil on May 25th, 183 received his medical education at St. Thomas's Hos He qualified in 1859 and for a short period was surge the Dowlais Ironworks. In 1862 he settled at Cra where he quickly gained a wide practice, obtained a nu of public appointments, and took an active interest in affairs. He retired in 1908. Mr. Martin, who was g esteemed, married Alice, the eldest daughter of Mark L the first editor of *Punch*, by whom he had one so seven daughters. He was a justice of the peac Sussex.

Medical News.

SOCIETY OF APOTHECARIES OF LONDON. examinations held recently the following candidates successful:—

Surgery.—C. W. Bower (Section II.), Cambridge and St. Ba mew's Hospital; R. H. Chadwick (Sections I. and II.), I. Harding (Sections I. and II.), Royal Free Hospital; S. M (Sections I. and II.), Middlesex Hospital; D. Min (Section I.), King's College Hospital; S. G. Mohamed (Sectio Liverpool; and K. S. Vine (Sections I. and II.), Royal Hospital.

Medicine.—J. Behesnilian (Section II.), Charing Cross Ho C. W. Bower (Section II.), Cambridge and St. Bartholomew' pital; C. G. Bunn (Section II.), Charing Cross Hospital; Dyer (Section I.), St. George's Hospital; I. Harding (Se I. and II.), Royal Free Hospital; S. C. Ho (Sectio Cambridge and London Hospital; D. Mintzman (Secti and II.), King's College Hospital; T. F. Reason (Secti and II.), St. Mary's Hospital; and K. S. Vine (Sections I. an Royal Free Hospital.

Forensic Medicine.—J. Behesnilian, Charing Cross Hospit Harding, Royal Free Hospital; M. Ibrahim and S. M Middlesex Hospital; J. E. Nicole, Westminster Hospital; Reason, St. Mary's Hospital; G. E. Spero, London Hospita K. S. Vine, Royal Free Hospital.

Midwifery.—L. E. Lewis, Glasgow; D. Mintzman, King's C H spital; J. E. Nicole, Westminster Hospital; and K. S. Royal Free Hospital.

The diploma of the Society was granted to the following cand entitling them to practise medicine, surgery, and midwifery: Bower, R. H. Chadwick, S. Mikhail, S. G. Mohamed, T. F. Reaso K. S. Vine.

MEDICAL SOCIETY OF LONDON.—The next me of this society will be held on Monday, Dec. 3rd, at 8.3 at 11, Chandos-street, Cavendish-square, W. 1, when cussion on the Surgical and Dental Treatment of S Facial Injuries will be introduced by Major H. D. G R.A.M.C., Captain Kelsey Fry, R.A.M.C. (T.), and Percival Cole. Colonial and other R.A.M.C. officer invited to attend.

Professor B. Krönig, Director of the Gyn logical Clinic at Freiburg, died on Oct. 29th at the a 55 years.

HUNTERIAN SOCIETY.—A meeting will be held on Thursday, Dec. 6th, at 5 P.M., at the Royal Society of Medicine, 1, Wimpole-Street, W., when a discussion on the Medical Classification of Recruits will be opened by Captain Haldin Davis, R.A.M.C.

HARVEIAN SOCIETY OF LONDON.—A meeting of this society will be held in the library of the St. Mary's Hospital Medical School on Dec. 15th, at 5.30 P.M., when a discussion on "Neurasthenia" will be opened by Dr. F. W. Mott, F.R.S.

SOCIETY FOR THE STUDY OF INEBRIETY.—The next meeting of this society will be held in the rooms of the Medical Society of London, 11, Chandos-street, Cavendish-square, W., on Tuesday, Jan. 8th, 1918, at 4 P.M., when Sir Robert Armstrong-Jones will open a discussion on "Alcohol and Mental States."

CENTENARIAN.—Mrs. Ann Vickery Ritchie passed away recently at Brighton, at the age of 100. Her hundredth birthday was in August last. She enjoyed good health and remarkable vigour until October, when she fell and broke a thigh.

CENTRAL MIDWIVES BOARD.—Special meetings of the Central Midwives Board were held at Queen Anne's Gate Buildings, Westminster, on Nov. 14th and 15th, with Sir Francis H. Champneys in the chair. Certain midwives were struck off the Roll, the following charges amongst others having been brought forward:—

A midwife being in attendance at a confinement and the patient suffering from persistently offensive lochia, she did not explain that the case was one in which the attendance of a registered medical practitioner was required, as provided by Rule E. 21 (4). This midwife neglected to take and record the pulse and temperature of the patient at each visit, as required by Rule E. 14, and to enter her record of pulse and temperature in a notebook or on a chart carefully preserved, as required by Rule E. 14. A case being one of abortion, the midwife neglected to explain that it was one in which the attendance of a registered medical practitioner was required, as provided by Rule E. 21 (2); she did not carry with her to a confinement the appliances and antiseptics prescribed by Rule E. 3, and did not keep her register of cases as required by Rule E. 24. Being in attendance at a confinement, and the placenta and membranes not having been completely expelled within two hours after the birth of the child, a midwife neglected to hand to the husband or the nearest relative or friend present the form of sending for medical help, properly filled up and signed by her, in order that this might immediately be forwarded to a medical practitioner or to an approved institution, as required by Rules E. 20 and 21 (3). The advice of a registered medical practitioner having been sought under Rule E. 20, she neglected to notify the local supervising authority thereof, as required by Rule E. 22 (1)(a). Being in attendance previous to and at a confinement and the patient suffering from excessive bleeding, a midwife did not explain that the case was one in which the attendance of a registered medical practitioner was required, as provided by Rule E. 21 (3); she neglected to disinfect her hands and forearms on each occasion before touching the generative organs of the patient or their neighbourhood, as required by Rule E. 4; and she neglected to wash the patient's external parts with soap and water and to swab them with an efficient antiseptic solution before making the first internal examination, as required by Rule E. 8. The midwife did not on each occasion when attending the patient wear a clean dress of washable material that could be boiled, as required by Rule E. 2.

At the meeting held on Nov. 15th a letter was considered from the general secretary of the Medical Defence Union asking the Board to deal with a complaint made against a certified midwife by a registered medical practitioner. The Board directed that the general secretary of the Medical Defence Union be informed that where a complaint for which an appropriate remedy is provided by due course of law is made against a midwife it is contrary to the practice of the Board to deal with the midwife until the complainant has exhausted his remedy at law. A letter was considered from the clerk of the London County Council asking the Board to take into consideration the opinion expressed by a London coroner that the form of sending for medical help, as prescribed by Rule E. 23 (a), should not specify the name of any particular doctor. The Board decided that the clerk of the London County Council be informed that the Board will take the coroner's suggestion into consideration on the next revision of the rules. A letter was considered from the medical officer of health for Brighton enclosing a draft circular letter which he proposes to send to all midwives practising within his jurisdiction, and asking whether, in the opinion of the Board, he would be acting within his powers by preventing midwives from attending patients suffering from gonorrhœal conjunctivitis while in attendance on other cases. The Board directed that with reference to the circular letter drafted by the medical officer of health for Brighton the reply be: (1) Ophthalmia. The Board agrees that in severe cases of ophthalmia it is very undesirable that the midwife should continue in charge of the eyes, as the disease is highly contagious. But it thinks that special arrangements, under the general supervision of an expert, should always be carried out with the consent of the patient (mother), who has the right to choose the medical practitioner called in accordance to Rule E. 6, and that the case should be visited and the reasons for such special arrangements explained to the mother and midwife by the inspector of midwives or by the medical practitioner called in consultation. (2) Stillbirths. The Board quite approves of the proposed arrangements for the examination of a piece of the placenta in such cases. It thinks, however, that the information as to the presence of syphilis should not be left to the midwife to convey to the parents.

THE King has sanctioned the following appointments to the Order of the Hospital of St. John of Jerusalem in England:—Surgeon-General Thomas Martin Corker, C.B., K.H.P., A.M.S.; Lieut.-Col. Reginald James Cope Cotes, R.A.M.C.; Lieut.-Col. Claude Kyd Morgan, C.M.G., R.A.M.C.; and Major James Fitzgerald Martin, C.M.G., R.A.M.C., to be Knights of Grace.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

The National Health Insurance Bill.

THIS Bill has been read a second time in the House of Commons. It deals with questions of finance and the simplification of administration. In the course of his speech, Sir E. CORNWALL, who represents the Insurance Commissioners, stated that during the year 1916 the employers and employed contributed £18,500,000 and the State £5,000,000 to National Insurance. That sum was disbursed as follows: Sickness and disablement benefit, £6,000,000; medical services, £4,800,000; maternity benefit, £1,250,000; sanatorium benefit, £750,000; administration expenses, £1,250,000; balance invested, £8,500,000. A great part of the discussion turned on the relation of solvent to insolvent Approved Societies.

HOUSE OF COMMONS.

THURSDAY, NOV. 22ND.

Review of Exceptions Act.

Mr. MONTAGUE BARLOW asked the Minister of National Service whether, in view of the fact that the Review of Exceptions Act was passed with the definite object of reviewing the cases of some 6000 men, the cases of these men had now all been considered; and whether he could hold out a prospect of introducing a Bill with a view to either restricting or repealing the provisions of this Act.—Sir AUCKLAND GEDDES answered: I am not aware that the Review of Exceptions Act was passed with the object stated in the question. When the Bill was introduced it was stated in this House that it would enable the military authorities to deal with 1,000,000 men, and that it was estimated that 100,000 recruits would be so obtained. At a later stage in the debate certain classes of men were withdrawn from the operation of the Bill and a substituted estimate was given that the number of men available for re-examination would exceed 500,000, and the number to be obtained for military service would be from 50,000 to 60,000. The men liable for re-examination under the Act have in fact not yet been examined. The operation of the Act has been restricted by the concession under which its provisions are not enforced where a man to whom notice has been sent shows that he is a man who has served overseas in the armed forces of the Crown and has been discharged on grounds of health. Moreover, there has been organised refusal to furnish particulars or to attend for medical examination as required by the Act by certain men to whom notices have been sent. I have been in communication with the Public Prosecutor on this question and proceedings are about to be taken to deal with such resistance to the Act. In other respects the Act remains a necessary part of the military service machinery and it is not proposed to introduce a Bill to repeal it or restrict its operation.

Medical Students in the Royal Navy.

Mr. COCHRANE asked the Secretary to the Admiralty whether medical students who were at present acting as surgeon probationers or sick-berth attendants in His Majesty's Navy could not obtain their discharge in order to resume their studies unless they were able to qualify as medical practitioners within nine months, whereas similar students in His Majesty's Army could obtain their discharge for this purpose if they could qualify within three years; and, if so, whether, in view of the shortage of medical practitioners, he would grant equal facilities to medical students in His Majesty's Navy.—Mr. MACNAMARA replied: Medical students who are serving in the Navy as surgeon probationers or sick-berth attendants and who apply for demobilisation for the purpose of sitting for their final examination are granted that permission if they can sit for their final examination within 18 months from

he date of their application. The question of being able to ualify in nine months has never been taken into account n considering such applications. I might add that at the resent moment steps are being taken, in conjunction with he Ministry of National Service, with a view to securing hat the service of medical students as surgeon probationers hall be limited to six months, but in no case shall exceed 2 months.

Infant Welfare Legislation.

Replying to Mr. CURRIE, Mr. HAYES FISHER (President of he Local Government Board) wrote: The Bill which I am nxious to introduce would be one for conferring on sanitary uthorities and county councils in England and Wales the ame powers in regard to maternity and infant welfare as ere conferred on local authorities in Scotland and Ireland y the notification of Births (Extension) Act, 1915—namely, ne power to make such arrangements as they think fit and s may be sanctioned by the Local Government Board, for ttending to the health of expectant mothers and nursing nothers and of children who have not attained the age of ve years and are not being educated in schools recognised y the Board of Education. I shall be very glad to see the ill introduced and printed.

MONDAY, NOV. 26TH.

Drill of R.A.M.C. Officers.

Major D. DAVIES asked the Under Secretary for War hether, in view of the demand for doctors for purely linical work both here and in France, he could state the uration of the period of drill which medical officers who oined the Royal Army Medical Corps had to undergo before ney were able to give their full time to the clinical duties their profession.—Mr. MACPHERSON answered: The uration of the course which includes not only drill but ilitary sanitation, anti-gas protection, and the duties of a edical officer with the troops in the field, depends upon the emands which have to be met for overseas reinforcements nd upon the shipping available, but it usually lasts three eeks.

Distribution of R.A.M.C. in France.

Major D. DAVIES asked the Under Secretary for War hether he would state the terms of reference of the committee which, under the chairmanship of General Sir rancis Howard, was now inquiring into the distribution of the oyal Army Medical Corps in France; whether subordinate fficers of the Royal Army Medical Corps had been enabled communicate directly with the committee, or if such communications were only made through their commanding fficers; and whether it was proposed that a similar inquiry ould be undertaken in this country.—Mr. MACPHERSON nswered: This committee was appointed by the War Office n its own initiative, and I think the consideration of such atters as my honourable and gallant friend suggests had tter wait until the report is received.

Surgeon-General Sir A. Sloggett.

Major D. DAVIES asked the Under Secretary for War nether Surgeon-General Sir Arthur Sloggett exercised mplete control over the Royal Army Medical Corps in rance and Belgium; and, if so, whether he was appointed that position because of his services as Director of Medical rvices in India during the period immediately preceding e appointment of Sir W. Babtie.—Mr. MACPHERSON wrote reply: He exercises control under the Commander-in nief in France in the same way as any other head of a partment in the field. He was sent to France by Lord tchener, because no doubt he thought him the best man the appointment.

Supplies of Carbide of Calcium.

Mr. CATHCART WASON asked the Secretary to the Admiralty nether his attention had been directed to the fact that . Henry P. Taylor was acting as surgeon to the lmiralty, and had received notice that no more carbide of lcium would be supplied him, and, in view of the fact that ing to the long nights in the North much of his work had be done in the dark, it was impossible to do his work thout a supply of necessary light; and whether he would e the matter his consideration.—Sir W. EVANS (Secretary the Ministry of Munitions) who replied, wrote: So far as I n aware no application for a supply of calcium carbide has en received by the Ministry of Munitions from Dr. H. P. ylor. Owing to the serious shortage of this material it s become necessary greatly to restrict its use for illuminating purposes. In cases, however, where it is proved at carbide is essential for carrying out Government war rk, the Ministry of Munitions, through their priority partment, have arranged to supply sufficient quantities for s purpose.

Yorkshire Practitioners and Invalided Soldiers.

Mr. TREVELYAN asked the representative of the National surance Commissioners whether he could state the number York and Yorkshire panel practitioners who had notified ir respective Insurance Committees that they were not prepared to accept invalided seamen, marines, and soldiers on their lists under the terms of the new regulations.—Sir E. CORNWALL wrote in reply: No, sir; the number of such doctors in the areas referred to in the question is not known to me. I may add that the regulations in question are framed in accordance with the express desires of authoritative representatives of the medical practitioners concerned, and that events subsequent to their issue have shown that the regulations are, in fact, acceptable to the great majority of such practitioners.

WEDNESDAY, NOV. 28TH.

Medical Boards.

Mr. NEEDHAM asked the Minister of National Service whether he was continuing to work with Local Medical War Committees in regard to the appointment of members of medical boards.—Sir AUCKLAND GEDDES wrote in reply: The answer is in the affirmative.

Mr. NEEDHAM asked whether the members of the medical boards were appointed directly by the right honourable gentleman, and whether he would state the exact method of composing these boards.—Sir AUCKLAND GEDDES replied: Members of medical boards are appointed by the Chief Commissioner of Medical Services on the authority of the Minister. The boards are composed of civilian medical practitioners drawn from a panel set up in the area of each board. The chairman of each board, who is the Deputy Commissioner of Medical Services of this Ministry for an area, arranges with the Local Medical War Committee a roster of attendances of members at sessions of his board. The panels are formed from medical practitioners whose names have been suggested by the Local Medical War Committee; a board of four requires a panel of 8 to 12 members; the nominations reach the Ministry through the Central Medical War Committee, they are reviewed in the medical department of the Ministry and by the Chief Commissioner of Medical Services for the region to which the panel belongs, and finally the appointments to the panels are made by the Minister and notified to the Deputy Commissioner of the area.

Mr. NEEDHAM also asked whether the Central Medical War Committee had any authority in the maintenance of or appointment to membership of national service medical boards; and, if so, whether he would state the exact terms of their authority.—Sir AUCKLAND GEDDES answered: The Central Medical War Committee have no authority in the maintenance of or appointment to membership of national service medical boards. The Committee, through their local organisation, have been asked by the Ministry, having in view the requirements of the civil population, to suggest the names of certain medical practitioners fitted to serve on the boards as stated in answer to the former question asked by the honourable Member. The Central Medical War Committee is the statutory appeal tribunal for the medical profession, and any member of a national service medical board called upon to undertake military service may have his case reviewed by this appeal tribunal. For a full statement as to the authority of this Committee I would refer the honourable Member to the Military Service (Professional Committees Regulations) Order 343 of 1916.

Appointments.

Successful applicants for vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward to THE LANCET *Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week, such information for gratuitous publication.*

DORNFORD, C. T., L.R.C.P. Edin., M.R.C.S. Eng., has been appointed Certifying Surgeon under the Factory and Workshop Acts for the Lytham District of the county of Lancaster.

JONES, C. R., M.B., Ch.B. Vict., Certifying Surgeon under the Factory and Workshop Acts for the Arnesby district of the county of Leicester.

NOLAN, M. J., L.R.C.S. Irel., Consulting Visitor in Lunacy to the Down District Asylum, Downpatrick.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index).

When the application of a Belgian medical man would be considered the advertisers are requested to communicate with the Editor.

BERMONDSEY MEDICAL MISSION FOR WOMEN AND CHILDREN.—Female Resident. Salary £150 per annum, with board, &c.

BIRMINGHAM CITY EDUCATION COMMITTEE.—Temporary Assistant School Medical Officer. Salary £300 per annum.

BIRMINGHAM AND MIDLAND EAR AND THROAT HOSPITAL, Edmund-street, Birmingham. Clinical Assistant. Salary £50 per annum.

BIRMINGHAM AND MIDLAND EYE HOSPITAL, Church-street, Birmingham.—House Surgeon. Salary £200 per annum.

BRISTOL GENERAL HOSPITAL.—Casualty House Surgeon for six months. Salary at rate of £175 per annum, with board, &c.

BRISTOL ROYAL HOSPITAL FOR SICK CHILDREN AND WOMEN.—Female House Surgeon. Salary, if qualified, £150 per annum; unqualified, £100, with board, &c.

BRISTOL ROYAL INFIRMARY.—House Physician and House Surgeon. Salary at rate of £120 per annum, with board, &c.

CHARING CROSS HOSPITAL.—Resident Medical Officer. Salary £400 per annum, with board, &c.

DARLINGTON HOSPITAL.—House Surgeon. Salary £200 per annum, with board, &c.

DUMFRIES AND GALLOWAY ROYAL INFIRMARY.—Resident House Surgeon. Also Assistant House Surgeon.

GENERAL LYING-IN HOSPITAL, York road, Lambeth.—Resident Medical Officer for three months. Salary £100 per annum, with board, &c.

GUILDFORD, ROYAL SURREY COUNTY HOSPITAL.—House Surgeon. Salary as arranged, with board, &c.

ILFORD URBAN DISTRICT COUNCIL.—Temporary Medical Officer of Health. Salary at rate of £550 per annum.

KENT EDUCATION COMMITTEE.—Temporary School Medical Inspector and Medical Officer of School Clinic. Salary at rate of £385 per annum.

LONDON LOCK HOSPITAL, Dean-street, Soho, W.—House Surgeon for six months. Salary at rate of £150 per annum, with board, &c.

MANCHESTER, CITY EDUCATION COMMITTEE.—Temporary Assistant School Medical Officer. Salary £400 per annum.

MANCHESTER ROYAL INFIRMARY (CENTRAL BRANCH).—Resident Surgical Officer. Salary £200 per annum.

MANCHESTER SANITARY COMMITTEE.—Female Medical Officer. Salary £400 per annum.

POOLE, BOROUGH OF.—Temporary Medical Officer of Health and School Medical Officer.

QUEEN'S HOSPITAL FOR CHILDREN, Hackney-road, Bethnal Green, E.—House Surgeon for six months. Salary £100 per annum, with board, &c.

QUEEN MARY'S HOSPITAL FOR THE EAST END.—House Surgeon.

ROYAL FREE HOSPITAL, Gray's Inn-road, W.C.—Female Medical and Surgical Registrars.

SERBIAN RELIEF FUND, 5, Cromwell-road, S.W.—Medical Officer; also Female Doctor for hospital for Serbian civilians.

STOKE-ON-TRENT, COUNTY BOROUGH TUBERCULOSIS SANATORIUM.—Resident Assistant Medical Officer. Salary £250 per annum, with board, &c.

VICTORIA HOSPITAL FOR CHILDREN, Tite-street, Chelsea, S.W.—House Physician. Salary £200 per annum, with board, &c.

WANDSWORTH UNION, ST. JAMES'S INFIRMARY, Ouseley-road, Balham, S.W.—Temporary Assistant Medical Officer. Salary £7 7*s.* per week, with resident allowances.

WEST LONDON HOSPITAL, Hammersmith-road, W.—Clinical Assistants for six months.

WHITTINGHAM, PRESTON, LANCS., COUNTY ASYLUM.—Locum Tenens, unmarried. Salary £7 7*s.* per week, with board, &c.

YORK COUNTY HOSPITAL.—Female House Physician. Salary £200 per annum, with board, &c.

Births, Marriages, and Deaths.

BIRTHS.

MORTON-WOOD.—On Nov. 26th, at 131, Bromley-road, Catford, S.E., the wife of Dr. S. S. Morton-Wood, of a son.

PHILP.—On Nov. 25th, at Northmoor road, Oxford, Margaret, the wife of Captain C. H. G. Philp, M.B., R.A.M.C., of a son.

ST. JOHNSTON.—On Nov. 21st, at Harrington-gardens, the wife of Captain Adrian St. Johnston, R.A.M.C., of a daughter.

MARRIAGES.

MULLINS—JACKSON.—On Nov. 20th, at Holy Trinity Church, Eltham, Captain H. R. Mullins, S.A.M.C., to Jocelyn Genville Selmes, younger daughter of Mr. and Mrs. F. S. Jackson, of North Park, Eltham, Kent.

SUTTON—WILSON.—On Nov. 20th, at the Parish Church, Rotherham, Surgeon-General Alexander Arthur Sutton, C.B., D.S.O., A.M.S., to Mary Wilson, R.R.C.

DEATHS.

HARVEY.—On Nov. 25th, of wounds, at a casualty clearing station, Gilbert Aberdein Harvey, Captain, R.A.M.C.

INGLIS.—On Nov. 26th, at Newcastle-on-Tyne, on her return from Russia, Dr. Elsie Inglis.

JAMESON.—On Nov. 26th, at 2, Great Cumberland-place, W. 1, Sir Leander Starr Jameson, Bart., P.C., C.B., M.D., in his 65th year. Funeral arrangements will be announced later. No flowers by special request.

YOUNG.—On Nov. 24th, at Westbourne-square, Edward Parker Young, M.R.C.S., L.R.C.P., L.S.A., &c., aged 79.

N.B.—A fee of 5s. is charged for the insertion of Notices of Births, Marriages, and Deaths.

Notes, Short Comments, and Answers to Correspondents.

THE SURGICAL REQUISITES EXHIBITION.

AN interesting exhibition of surgical appliances has just been held in the Grafton Galleries by the Surgical Requisites Association, of 17, Mulberry Walk, Chelsea. This association has done much good work for nearly the whole duration of the war in making surgical appliances of all kinds for the use of the wounded, and it was thought well to hold an exhibition of the products of the skill of the members of the association, at the same time as a fair for the sale of fancy articles for the purpose of repairing the association's finances; and it says much for the broadmindedness of the association that several other societies of like nature were enabled also to show their work. Perhaps the most striking exhibit was the papier maché splints. These are of all sorts and the method is adaptable to practically every part of the body; by means of a solution of cotton in a copper salt it has been found possible to make the splints perfectly waterproof, and their extreme lightness will commend them to every surgeon. They are superior to celluloid in that they are non-inflammable, and as they are comparatively transparent to X rays a skiagram can be taken although the splint is in position. Lastly, these papier maché splints are extremely comfortable, for they always fit exactly, as they are moulded to each individual case. The S.R.A. "Williams" double Balkan support is an independent erection over the bed, fitted with travelling framework suspended from ball-bearing runners on a railway track; there are also swinging booms sliding on the Balkan beams to any alignment of the body required, with pulley attachments for slinging the limbs of patients and for counterbalances. There are also extension bars in various positions, and a lifting framework bed with winding gear for raising separately or together the head and feet. In fact the whole arrangement is most complete and useful, the only fear being that if many more appliances are added to the bed it will become too complicated for use, a possibility which all who have to do much with the working of wards will acknowledge. The Kensington W.H.S. depôt had a large number of exhibits, among which may be mentioned the flexing glove for bending stiff fingers, the Stuart Moore arm flexion splint, and the Sinclair net bed. The P.M. Standard Splint Association had some useful modifications of Thomas's splints. The British Red Cross Society exhibited some convenient patterns of arm and leg splints. The cradle leg splints were especially good. Mr. J. Coryton Roberts showed several ingenious appliances. The "Lanka" sling crutch transfers much of the weight of the body to the hand, in this way relieving the axilla. The "folding cradle" is cheap, effective, and easily stowed away. The "Gladys" bed-table is extremely ingenious, and should prove of the greatest use to those confined to bed. The Clifton bed book-rest is also clever. The whole exhibition demonstrated the great amount of ingenuity and skill lying hitherto dormant among the leisured population of this country.

BOOKS OF REFERENCE.

THAT useful publication, *The Year Book of the Universities of the Empire* (London: Herbert Jenkins. 1917. Pp. 412. Price 7*s.* 6*d.* net), which was suspended last year for reasons of economy, again makes its appearance, though in a slightly curtailed form. Readers are referred to the 1915 edition, where full information will be found regarding conditions of admission, degrees, scholarships, residential facilities, laboratories, museums, libraries, and so forth. The names given in the directories of the individual universities in the present edition of the Year Book are those of the incumbents of the offices, whether still fulfilling their duties at the university or otherwise engaged on national service, though in some cases there are omissions, the information not having been received by the compilers. Appendices to the present volume give summaries of the Beit Memorial Fellowships for medical and scientific research, the science research scholarships awarded by the Royal Commissioners for the exhibition of 1851, and the Rhodes Scholarships.—The official book of reference to the Association of Head Mistresses, *The Girls' School Year Book*, 1917 (London: The Year Book Press. Pp. 632. Price 5*s.* net), contains an alphabetical list of public schools for girls, together with full information regarding terms, fees, hours of attendance, scholarships, names of staff, and other matters of interest to both parents and teachers. A section of the book deals with the future career of girls on leaving school, and particulars are given of various professions and appointments for women.—*The Annual*

Charities and Digest, now in its thirty-sixth edition (London: Longmans, Green, and Co. 1917. Pp. ccclxxvi. + 702. Price 5s. net), is a classified register of charities in or available for the metropolis, together with a digest of information respecting legal and voluntary means for the prevention and relief of distress and the improvement of the condition of the poor. There is an ample index and an introduction, How to Help Cases of Distress, by Mr. C. S. Loch, late secretary to the council of the Charity Organisation Society. Articles on special branches of charitable work include one on Lunatics, Idiots, and Imbeciles, by Dr. H. Rayner, and one on Inebriety and Inebriates, Tuberculosis and the Tuberculous, and Child Welfare, by Dr. T. N. Kelynack.—*British Rainfall*, by H. R. Mill and Carle Salter (London: Edward Stanford. 1917. Pp. 256. Price 10s. net), deals with the distribution of rain in space and time over the British Isles during the year 1916. The records have been made by more than 5000 observers in Great Britain and Ireland. Short articles discuss various branches of rainfall work.

A GENERAL LICENCE FOR THE PURCHASE OF POTASSIUM COMPOUNDS FOR MEDICINAL PURPOSES.

NDER an Order issued by the Ministry of Munitions, dated Oct. 17th, 1917, no person may offer to purchase, purchase, or take delivery of certain potassium compounds, except in accordance with the terms of a licence. No licence is required (*a*) by the Admiralty or War Office, or (*b*) by any person for the purchase and delivery of potassium compounds in quantities not exceeding in weight an aggregate of 3 lb. avoirdupois during any one calendar month. Caustic potash, chloride, carbonate, and sulphate of potash are the compounds included, while any material applies also of which more than 10 per cent. consists of any one or more of the above compounds. The purchase may be licensed in regard to exceeding the supply of 1 lb. per month, provided that the compounds so purchased are used solely in B.P. form or in B.P. preparations for purely medicinal purposes. By this general licence medical men, druggists, hospitals, and similar institutions are relieved of the onus of applying for individual licences. It will, however, be necessary for wholesale houses in making their returns to the Controller to state the aggregate amount and value of the sales of compounds for purely medicinal purposes during the period covered by each return.

THE CAMERA CLUB.

DURING December the Camera Club (17, John-street, Adelphi, W.C. 2) is showing an exhibition of black-and-white drawings by patients and members of the staff of the 3rd London General Hospital illustrating the humours of ward life as seen by the wounded and their orderlies. Admission, between 11 A.M. and 5 P.M., is free, and tickets can be obtained from any member of the club or on application to the honorary secretary.

A SUBSTITUTE FOR IODINE TINCTURE.

HIGHLY placed German veterinary surgeon states from long experience that tincture of iodide can be effectively replaced by the following mixture: $FeSO_4$, 5; tannin dissolved in spirit), 5; acid. carbol. liq., 1; water to 100. Carbolic ink, as he calls it, is stated to be both disinfecting and drying to wounds.

Medical Diary for the ensuing Week.

SOCIETIES.

MEDICAL SOCIETY, Burlington House, London, W.

THURSDAY.—Papers:—Prof. W. H. Young: On the Series of Legendre.—Mr. L. Hartshorn: The Discharge of Gases under High Pressures (communicated by Hon. R. J. Strutt).—Dr. A. Russell: The Electrostatic Problem of a Conducting Sphere as a Spherical Cavity (communicated by Dr. C. Chree).—Prof. G. N. Watson: The Zeros of Bessel Functions (communicated by Prof. J. W. Nicholson).

MEDICAL SOCIETY OF MEDICINE, 1, Wimpole-street, W.

MEETINGS OF SECTIONS.

Tuesday, Dec. 4th.

PSYCHIATRY (Hon. Secretaries—Bernard Hart, G. F. Barham): at 5.30 P.M.

Paper:

Capt. W. H. R. Rivers, R.A.M.C., F.R.S. (introduced by the President): The Repression of War Experience.

LARYNGOLOGY (Hon. Secretaries—Gordon W. Goodhart, J. A. Murray): at 5.30 P.M.

Papers:

Mr. W. S. Lazarus-Barlow: An Attempt at the Experimental Production of Carcinoma by means of Radium.

Prof. S. G. Shattock, F.R.S.: Explosive Phenomena in Gunshot Wounds.

Thursday, Dec. 6th

PHYSIOLOGY AND CLIMATOLOGY (Hon. Secretaries.—Chas. W. Buckley, J. Campbell McClure): at 5.30 P.M.

Paper:

Dr. C. F. Sonntag (M.O. in charge of the Hydrological Department, Military Orthopædic Hospital, Shepherd's Bush): The Physiological Action of Whirlpool and Manipulation Baths, with Indications for Treatment based thereon.

Dr. Sonntag will also demonstrate the Arthrodynamograph.

(At 7.15 P.M. the members will dine together at Pagani's Restaurant, Great Portland street, W., and members may bring guests. Members who wish to dine are requested to send their names to Dr. Campbell McClure, 59, Harley-street, W. 1)

OBSTETRICS AND GYNÆCOLOGY (Hon. Secretaries—T. G. Stevens, Comyns Berkeley): at 8 P.M.

Discussion:

Scopolamine-morphine Narcosis in Child-birth (Twilight Sleep).

The Discussion will be opened by Dr. J. S. Fairbairn, Dr. C. Hubert Roberts, Mr. T. G. Stevens, and Dr. Herbert Williamson.

Friday, Dec. 7th.

LARYNGOLOGY (Hon. Secretaries—W. D. Harmer, Frank A. Rose): at 4 P.M.

Cases will be shown.

EPIDEMIOLOGY AND STATE MEDICINE (Hon. Secretaries—William Butler, Major Greenwood): at 8.30 P.M.

Presidential Address.

Lieut.-Col. G. S. Buchanan, M.D.: Epidemics of the Easter Campaign.

MEDICAL SOCIETY OF LONDON, 11, Chandos-st., Cavendish-sq., W. 1.

MONDAY.—8.30 P.M., Discussion on Surgical and Dental Treatment of Severe Facial Injuries (introduced by Major H. D. Gillies, R.A.M.C., Capt. K. Fry R.A.M.C.(T.), and Mr. P. Cole.

WEDNESDAY.—5 P.M., Lecture VI.:—Prof. A. Keith: The Bearing of the Discoveries of Modern British Neurologists on Orthopædic Practice.

FRIDAY.—5 P.M., Lecture VII.:—Prof. A. Keith: The Bearing of the Discoveries of British Neurologists (continued).

The Lectures will be illustrated by specimens from the Army Medical Collection now on exhibition in the Museum and also by specimens from the College Collection.

POST-GRADUATE COLLEGE, West London Hospital, Hammersmith-road, W.

MONDAY.—2 P.M., Medical and Surgical Clinics. X Rays. Mr. Gray: Operations. Mr. B. Harman: Diseases of the Eye. Dr. Simson: Diseases of Women.

TUESDAY.—2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. Dr. Banks Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin.

WEDNESDAY.—10 A.M., Dr. Arthur Saunders: Diseases of Children. Dr. Banks Davis: Operations of the Throat, Nose, and Ear. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations.

THURSDAY.—2 P.M., Medical and Surgical Clinics. X Rays. Mr. Gray: Operations. Mr. B. Harman: Diseases of the Eye.

FRIDAY.—10 A.M., Dr. Simson: Gynæcological Operations. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. Dr. Banks Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin.

SATURDAY.—10 A.M., Dr. Arthur Saunders: Diseases of Children. Dr. Banks Davis: Operations of the Throat, Nose, and Ear. Mr. B. Harman: Eye Operations. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N. 15

MONDAY.—2.30 P.M., Children's Diseases: Dr. T. R. Whipham. Gynæcological Diseases: Mr. F. L. Provis. Surgical Operations: Mr. E. Gillespie. 3 P.M., Medical In-patients: Dr. R. M. Leslie. 7 P.M., Venereal Clinic: Dr. Kinsella.

TUESDAY.—10 A.M., Surgical Operations: Mr. J. Howell Evans. 2.30 P.M., Medical Out-patients: Dr. A. G. Auld. Surgical Out-patients: Mr. Howell Evans. Nose, Ear, and Throat Diseases: Mr. C. H. Hayton. X Rays: Dr. Metcalfe. 3.30 P.M., Medical In-patients: Dr. A. J. Whiting.

WEDNESDAY.—2.30 P.M., Medical Out-patients: Dr. T. R. Whipham. Diseases of the Skin: The Dermatologist. Eye Diseases: Mr. A. S. Worton. Operations:—Nose, Ear, and Throat: Mr. Hayton; 4 P.M., Eyes: Mr. Worton. 3.30 P.M., Special Demonstration:—Mr. T. H. C. Benians: The Detection and Treatment of Disease "Carriers" in Private Practice. 5 P.M., Venereal Clinic: Mr. E. Gillespie and Mr. Benians.

THURSDAY.—2.30 P.M., Medical Out-patients, Dr. A. J. Whitngi Surgical: Mr. H. W. Carson. X Rays: Dr. Metcalfe. Gynæcological Operations: Dr. A. H. Giles. 3.30 P.M., Medical In-patients: Dr. R. M. Leslie.

FRIDAY.—2.30 P.M., Surgical Out-patients: Mr. Gillespie. Eye Diseases: Mr. A. S. Worton. 7 P.M., Venereal Clinic: Mr. E. Gillespie and Mr. Benians.

SATURDAY.—2.30 P.M., Surgical Operations Mr. H. W. Carson.

ST. JOHN'S HOSPITAL FOR DISEASES OF THE SKIN, 49, Leicester-square, W.C.

THURSDAY.—5 P.M., Chesterfield Lecture:—Dr. M. Dockrell: The Ringed Eruptions of the Skin.

EDITORIAL NOTICES.

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITOR," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention should be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

Lectures, original articles, and reports should be written on one side of the paper only, *and when accompanied by blocks it is requested that the name of the author, and if possible of the article, should be written on the blocks to facilitate identification.*

We cannot undertake to return MSS. not used.

Offices: 423, STRAND, LONDON, W.C. 2.

MANAGER'S NOTICES.

TO SUBSCRIBERS IN THE UNITED STATES.

Messrs. Wm. Wood and Co., of New York, are relinquishing their Agency for the supply of THE LANCET in the United States at the end of the present year. The Manager of THE LANCET will be pleased to supply copies direct from the London Office to subscribers in the United States at the strictly prepaid rate of $8 for twelve months. Subscriptions may commence at any time. Drafts and Money Orders should be made payable to the Manager, Mr. CHARLES GOOD, 1, Bedford-street, Strand, London, W.C. 2, England.

TO SUBSCRIBERS.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

TO COLONIAL AND FOREIGN SUBSCRIBERS.

Subscribers abroad are particularly requested to note the rates of subscriptions given on advertisement page 4.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the rates shown, whatever be the weight of any of the copies so supplied.

Communications, Letters, &c., have been received from—

A.—Prof. F. W. Andrewes, Lond.; Messrs. Abdulla and Co.; Lond.; Lieut.-Col. J. G. Adami, A.D.M.S.; Lieut. G. H. Almond, R.A.M.C.; Mr. J. S. Aitken, Mystic, U.S.A.; Messrs. Iodogénol

IODINE in its **MOST RELIABLE FORM.** | **PÉPIN** | **IODINE** in its **MOST RELIABLE FORM.**

Iodogenol is a preparation containing Iodine in an organic, assimilable form, possessing about 38 times the physiological activity of that of Iodide of Potassium. This preparation has, according to the clinical reports of eminent Medical Men, succeeded where the usual Iodide treatment has failed.

Iodogénol does not produce Iodism or other bad symptoms.

***INDICATIONS.*—SYPHILIS, RHEUMATISM, the various phases of TUBERCULOSIS, GENERAL DEBILITY, &c.**

LITERATURE and CLINICAL REPORTS on REQUEST.

)W THE VITAMINES WERE DISCOVERED.

'he discovery of the **Vitamines** s brought about by investigating cause of Beri-Beri, a disease ich was very prevalent in the lay Peninsula and other countries ere rice is the staple article of t. The rice grain consists of an er part and an outer husk. In ished rice the outer husk is ioved and the natives, who lived efly on such rice, suffered from i-Beri. It was found that the litions of the husk, or the substi- ion of unpolished for polished rice s sufficient to cure the disease. e symptoms of this disease are h as arise from peripheral neuritis, atrophy of the peripheral nerves h subsequent degeneration of the scles, including the heart muscle.

'he "**something**" **contained in rice husk which prevents or es Beri-Beri has been shown by nk to consist of Vitamine.** He has ceeded in extracting it from the husk in a more or less pure state.

/ITAMOGEN stands alone as a ans of supplying the **Vitamines,** l it must be remembered that **TAMOGEN** not only contains all essentials of a complete food, but ibles the body to utilize other food better advantage owing to the ion of **Vitamine** as a ferment.

Vitamogen

Regd.

VITAMOGEN represents a highly Concentrated Food and contains the **Vitamines** in their natural and unchanged condition in combination with Fats, Proteids, and Carbohydrates—the whole constituting a Complete Food in a palatable and easily assimilable form.

VITAMOGEN is useful in any form of **Nervous Disease, Neurasthenia, Shell Shock, Hysteria,** immediately after operations when the stomach is in a very irritable condition owing to the effect of the anæsthetics, &c., **Anæmia, Nervous Dyspepsia** and all **Wasting Diseases, Influenza,** and for its great Tonic-effect in **convalescence after severe illness,** owing to its properties of aiding the body to form fresh tissues to replace those which have been wasted. Also for **Sleeplessness, Malnutrition,** and the **effects of overwork** and **Nervous Break-down.**

Free Samples are supplied to Medical Men. ***Vitamogen*** *is packed in two sizes—***2/-** *and* **4/6***—or in bulk for Hospitals. Literature on the* ***Vitamines*** *will be sent with Sample upon application.*

"THE LEICESTER" PERFECT PLASTER-OF-PARIS BANDAGES.

(PATENT.)

"Repeated trials of samples supplied by Messrs. A. de St. Dalmas & Co., of Leicester, have convinced us that the improved and perfected PLASTER-OF-PARIS BANDAGES recently patented by this firm, will be found really valuable aids in surgical work, and tend to remove most of the objections to the use of Plaster-of-Paris. They are not affected by atmospheric moisture, are easily portable, not liable to shedding, and can be applied without difficulty, and with perfect neatness."—*British Medical Journal.*

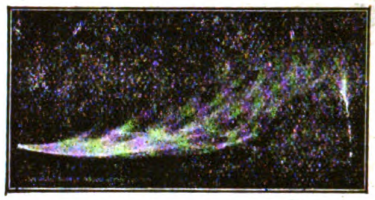
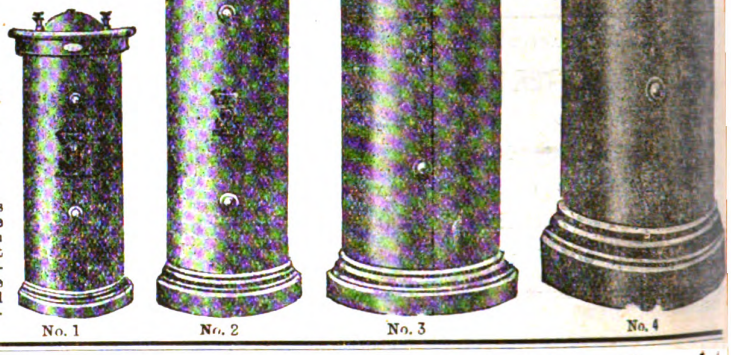
GREVILLE'S INTENSIFIED INDUCTION TRANSFORMERS

have proved the best for
INTENSE OUTPUT & CONTINUOUS USE.



INCREASE THE OUTPUT OF YOUR INSTALLATION
by using Greville's Intensified Transformers.
YOU WILL GET BETTER RESULTS

Prices: (including Condenser and Variable Primary)



Spark length in inches ...	No. 1 8 in.	No. 2 10 in.	No. 3 12 in.	No. 4 16 in.
Price	£25	£30	£35	£45

Owing to prevailing conditions our price are subject to fluctuation.

For prolonged and heavy discharges these transformers are undoubtedly the best. A special insulating material, which has been found to be far superior to that commonly used, is employed which permits of heavier discharges and avoids the risk of break down. There are several hundreds of these transformers in continual use.

Actual Photograph of the extraordinary electrical discharge obtained from our No. 3 Transformer, through 12 inches of air space.

Government Forethought

provided our troops with pure wool underwear as a protection against winter hardships. For more than a quarter of a century Wolsey Underwear has been recommended by doctors to guard civilians against weather treachery.

Wolsey is made of pure, clean wool. It is always new, never re-manufactured. Hygienic — absorbent — unshrinkable (any garment found otherwise is replaced free). Wolsey has proved to be the ideal underwear for men, women, and children in winter days.

Wolsey

Pure Wool Underwear

Wolsey should now be ordered in advance to ensure receiving full supplies. The Wolsey factories are working at their utmost to make warm garments for our soldiers—patriotism acknowledges their claims to first attention.

The price of Wolsey is naturally increased with the enhanced cost of wool, but the quality is unvarying. The value of Wolsey thus remains beyond all question.

During Convalescence

JARDOX is invaluable because it provides just that stimulant—that easily assimilated nutriment—so essential for the rebuilding of the worn nerves and tissues.

JARDOX contains an exceptional proportion of body building material—fibrins, coagulated albumins and soluble proteins—all-important during convalescence. JARDOX is extremely economical in use and is deliciously appetising, exactly like home-made Beef Tea, retaining the full flavour of the prime British Beef from which it is made. These are some of the reasons why JARDOX is used whenever Beef Tea is needed in the many large hospitals and institutions throughout the country.

JARDOX

The Real Beef Tea with the Real Beef Flavour

Awarded the Certificate of Merit by the British Institute of Hygiene.

Samples gladly sent post free on receipt of professional card and mention of "The Lancet."

JARDOX, Ld., Crystal Palace Works, London, S.E.20

THE DIETETIC VALUE OF COCOA

Of the beverages in common use (Tea, Coffee and Cocoa), Cocoa is the best, because—

1. It is not a mere stimulant: it is also a true food.
2. Its stimulant value is similar to that of Beef Tea, and its nutritive value bears comparison with that of milk.

It is quickly absorbed in the stomach, leaving no undigested irritant residue, and is therefore pre-eminently suitable for invalids—

—Van Houten's Cocoa.—

Glycolactophos

This preparation being British, inability to obtain supplies need not be anticipated.
FORMULA.—Casein 95%, Glycerophosphate of Sodium 2½%, Glycerophosphate of Calcium 2½%.
Its use is indicated in the treatment of Neurasthenia, Tabes Dorsalis, Neuralgia, Nervous conditions in which an excess of phosphates are excreted in the urine, Phthisis, Chronic Dyspepsia, Anæmia, Insomnia, and wasting diseases generally.
The presence of the Calcium salt gives it a high therapeutic value in the treatment of Rickets.

The . . Soft Light

THERE is a soothing restfulness in the Night Light that commends it to all who know the needs of the sick room.

The Night Light gives a steady, yet unobtrusive, light. It illuminates a room just sufficiently for comfort and convenience. The fact, also, that MEDICAL MEN use

Price's Night Lights

in their own homes, and advise their use in the sick room, is proof that these favourite lights are cleanly to handle and hygienic in use.

PRICE'S NIGHT LIGHTS afford a light both large and small, according to the variety chosen.

There's wisdom in keeping a box in the home.

BLENOSAN CAPSULES

As a routine treatment for

GENITO-URINARY CONDITIONS.

BLENOSAN is a mixture of the finest East India Santal Oil with a specially prepared fluid extract of Kava-Kava. It is presented in the form of accurately-measured Capsules, and affords an ideal medicament for the treatment of all inflammatory conditions of the urethra.

BLENOSAN is an improvement upon the ordinary Santal, and the full proportion of the alpha resin of Kava-Kava ensures all the anæsthetic and diuretic properties of the root in a standardised and dependable form.

BLENOSAN CAPSULES consequently are indicated in all pathological conditions which affect the genito-urinary system, including acute Cystitis, Vaginitis, and Leucorrhœa, and where intense hyperæmia and swelling of the mucous membrane give rise to a diminution of the urinary canal.

BLENOSAN CAPSULES are well adapted for the continuous and systematic treatment of such cases, and are being used with excellent results by many of the most experienced and successful Physicians.

BLENOSAN CAPSULES can be prescribed for a course of treatment extending over two or three weeks.

MADE IN AUSTRALIA

"EUMENTHOL" TOOTH POWDER
(HUDSON)

A fragrant, palatable, non-toxic, non-irritant germicidal powder, being a combination of Formalin, Menthol, &c., with a diatomaceous earth in conjunction with a pure high-grade peroxide (MgO_2). The Menthol is in chemical combination with Formalin to form the new antiseptic compound, Dimenthol-Formal, CH_2 ($C_{10}H_{19}O$)$_2$ M.P. 56, 5°C. (Brochet), and unites an antiseptic action twice more powerful than Sublimate, with a very decided effect in hardening the Gums. A strength of 1 in 1000 kills all the salivary bacilli in less than two hours. Dessirier recommends Dimenthol-Formal for the treatment of aphthæ.

"Eumenthol" Tooth Powder on dissociation (in contact with water or the Oral Fluids) liberates free active Oxygen, and Hydroxide of Magnesia in a minutely divided state is produced.

THE LANCET states: "This Tooth Powder is designed on sound principles and is very agreeable to use. The distinctive feature about it is that, in addition to some approved germicides, it contains MgO_2, which readily parts with free oxygen, as our experiments have shown."

KEROL

KEROL combines all the properties which go to the making of an ideal preparation.
It has been shown to be practically non-toxic, non-irritant and non-corrosive—a combination of properties which make it the one preparation which can be used with perfect confidence wherever the use of either a disinfectant or antiseptic is indicated. It is of high and definite germicidal value and is perfectly homogeneous

KEROL is highly recommended by Bacteriologists and by prominent members of the Medical Profession.

KEROL CAPSULES

INTESTINAL. These are of great value where intestinal antisepsis is indicated. In a comparatively short space of time the coli content of the intestine is reduced by over 99 per cent. They are non-irritant and perfectly safe

STOMACHIC. For use in cases of stomach fermentation and other gastric troubles, and are of great value in reducing the number of malign organisms prior to administration of treatment with lactic ferments, i.e., sour milk, etc.
